land.

JAMES could never forgive Henry for the loss of this brave officer. He sent to demand satisfaction; but all the answer he received was, that Barton and his crews were lawless pirates, and that what had been done against them ought never to have been resented amongst sovereign princes. James asserted, that Barton was no pirate, because he bore his commission; and that he ought to have been convicted of piratical acts before he was treated as being guilty of them. Henry intimated to James, that he was willing to accommodate the affair by way of negotiation; but James
60 thought himself affronted by the proposal.

re- to in- Eng-

Various negotiations took place concerning this and other affairs till the year 1513; when James, though he had for some time before been fully resolved upon a war with England, thought it highly necessary that it should have the sanction of his parliament, which he assembled for that purpose. The young nobility were not only inspired with the sentiments of James, but had been won over by the French; and the majority of them, as well as of the clergy (which was somewhat extraordinary, as James was, in effect, to fight against the pope and his allies), were keen for a war with England. The old counsellors, on the other hand, who saw the flourishing state of Scotland, arising from a long peace and their commerce, which was protected by a fleet, dreaded the ruinous consequences of the war. The queen naturally headed this party; and she was joined by the earl of Angus and the wisest part of the nobility. Their arguments made no impression upon James, who had received a present from Louis of four ships laden with wine and flour, and two ships of war completely equipped, one of them carrying 34 pieces of brass ordnance. He promised to the French queen, upon his honour, that he would take the field against the English; and she had sent him a fresh letter, gently reproaching him for want of gallantry, and for not being so good as his word. In short, the reasonings of the wisest and best part of the nobility were overruled, and the expedition against
1 England was resolved on.

ots d.

The earl of Hume, who was chamberlain of Scotland, was, at this juncture, at the head of 7000 or 8000 men, with whom he committed prodigious devastations on the English borders. Henry's queen, Catharine of Spain, whom he had left regent of his dominions, issued a commission of array, directed to Sir Thomas Lovel, knight of the garter, for assembling the militia of the counties of Nottingham, Derby, Warwick, Leicester, Stafford, Rutland, Northampton, and Lincoln. The management of the war, however, was chiefly committed to the earl of Surry, who assembled the militia of Chester, Lancaster, Northumberland, Westmorland, Cumberland, and the bishopric of Durham. The earl of Hume had by this time laid great part of Northumberland waste; and his men were returning home laden with booty. The earl of Surry, resolving to intercept them, ordered Sir William Bulmer to form an ambush with 1000 archers, at a place called *Broomhouse*, which was extremely convenient for that purpose, as the Scots were obliged to pass that way. As the latter expected nothing of that kind, Bulmer executed his orders with great success. The archers assaulted the Scots all at once, and made so good use of their arrows, that their main body was put to flight, 500 were killed, and 400 taken, with the Lord Hume's standard, which he left on the field of battle; the greatest part of the plunder being recovered at the same time. The commonalty of Scotland termed this expedition of the Lord Hume's the *Ill Road*. 362

James was more exasperated than ever by this defeat, and continued his preparations for invading England with additional vigour. His queen did all that became a wife and prudent wife to divert him from his fatal purpose. She endeavoured to work upon his superstition, by recounting to him her ominous dreams and boding apprehensions. James treating these as mere illusions and fictions of the brain, she had recourse to other arts. While James was waiting at Linlithgow for the arrival of his army from the north and the Highlands, he assisted one afternoon at the vespers in the church of St Michael. Being placed in one of the canons seats, a venerable comely man, of about 52 363 years of age, entered, dressed in a long garment of an azure colour, and girded round with a towel or roll of linen, his forehead bald, and his yellow locks hanging down his shoulders; in short, he was dressed and formed

The que endeavo to dissua James fr his desig

A phan- tom appe to him.

formed to appear like St Andrew, the apoſtle of Scotland, as he is repreſented in painting and ſculpture. The church being crowded, this perſonage, with ſome difficulty, made his way to the king's ſeat; and leaning over it, he ſpoke to the following purpoſe: "Sir (ſaid he), I am ſent hither to entreat you for this time to delay your expedition, and to proceed no farther in your intended journey: for if you do, you ſhall not proſper in your enterpriſe, nor any of your followers. I am further charged to warn you, if ye be ſo refractory as to go forward, not to uſe the acquaintance, company, or counſel of women, as ye tender your honour, life, and eſtate." After delivering thoſe words, he retired through the crowd, and was no more ſeen, though, when the ſervice was ended, James earneſtly inquired after him.

That this ſcene was acted, ſeems to be paſt diſpute; for Sir David Lindſay, who was then a young man, and preſent in the church, reported it both to Buchanan and Lindſay the hiſtorian. It is, however, equally certain, that the whole was a contrivance of the queen, to whoſe other afflictions the ſtings of jealouſy were now added. In one of the Scotch inroads into England, one Heron, the proprietor of the caſtle of Ford, had been taken priſoner, and ſent to Scotland; where he was detained on a charge of murder, of which he ſeems to have been innocent. The Engliſh hiſtorians mention this as having paſſed after James entered England: but from the latter part of the ſuppoſed phantom's ſpeech, it is probable that it happened before; and that Heron's wife and beautiful daughter had been for ſome time ſoliciting James for his deliverance. Be that as it may, it is too probable that James was ſmitten with the charms of the daughter; and that her mother, who was a moſt artful woman, knew how to avail herſelf of the conqueſt. Pretending that ſhe had intereſt enough to procure the releaſe of the lord Johnſton and Alexander Home, who were priſoners in England, ſhe was permitted by James to keep a conſtant correſpondence with the earl of Surry, to whom ſhe is ſaid to have betrayed all James's ſecrets and meaſures. The rendezvous of James's army was at the Burrow-moor, to which James repaired; and having given orders for the march of his artillery, he lodged at the abbey of Holyroodhouſe. While he was there, another attempt was made to divert him from his purpoſe of invading England: but James, deaf to all the ſolicitations and inventions of his queen, muſtered his army; and on the 22d of Auguſt he paſſed the Tweed, encamping that night near the banks of the Twiſſel. On his arrival at Twiſſelhaugh on the 14th, he called an aſſembly of his lords together, and made a declaration, that the heirs of all ſuch as ſhould die in the army, or be killed by the enemy during his ſtay in England, ſhould have their wards, relief, and marriages of the king; who, upon that account, diſpenſed with their age. This is ſaid to have been the criſis of that prince's fate. Abandoned to his paſſion for his Engliſh miſtreſs, ſhe prevailed with him, at her mother's inſtigation, to trifle away his time for ſome days; during which interval, the junction of the Engliſh army was formed. The earl of Surry, the Engliſh general, was then at Pomfret: but ordered the landholders of the neighbouring counties to certify to him in writing what number of men each could furniſh, charging them to be ready at an hour's warning; and he laid his plan ſo, as not to bring his army into the field till James had advanced ſo far into England as to render it very difficult for him to retire without a general battle. This precaution aſſiſted the Lady Ford (as ſhe is called) in perſuading James that there was no danger in the delay, becauſe the Engliſh had not the face of an army in the field.

In the mean time, the earl of Surry ordered the governors of Berwick and Norham, the two ſtrongeſt places on the frontiers of England, to prepare for a vigorous reſiſtance in caſe they were attacked; and directed them to certify how long they could hold out, in hopes, that if they made a reſolute defence, James would march on, and leave them in his rear. The governor of Norham's anſwer was, that his caſtle was ſo well provided, as to leave him no doubt, in caſe of a ſiege, to be able to defend it till King Henry ſhould return from abroad, and relieve it in perſon. James, however, beſieged it on the 25th of Auguſt, and battered it ſo furiouſly, that he took it by capitulation the ſixth day after. James then proceeded to the caſtle of Etal belonging to the family of Manners (now duke of Rutland); which he took and demoliſhed likewiſe, as he alſo did Wark, and arrived before the caſtle of Ford.

365
The Scots take the caſtles of Norham, Etal, and Wark.

The Scotch army is generally allowed to have conſiſted of at leaſt 50,000 men when it paſſed the Tweed. At this time it was encamped on the heights of Cheviot, in the heart of a country naturally barren, and now deſolate through the precautions taken by the Engliſh general. Being obliged to extend their quarters for the benefit of ſubſiſtence, the mercenary part of them had acquired a conſiderable plunder, with which, as uſual, they retired to their own country, as many more did for want of ſubſiſtence. The earl of Surry knew their ſituation, and ordered the rendezvous of his army, firſt at Newcaſtle, and then near Norham, having certain intelligence of the vaſt deſertions daily happening in the Scotch army, which had reduced it greatly. The wetneſs of the ſeaſon rendered his march, eſpecially that of the artillery, extremely difficult; but being joined by ſeveral perſons of diſtinction, he marched on the 3d of September to Alnwick, where he was reinforced by 5000 hardy veteran troops, ſent from the Engliſh army on the continent, under the command of his ſon the lord admiral of England; ſo that the Engliſh authors admit his army to have conſiſted of 26,000 men, all completely armed and provided for the field. James having, in the manifeſto which he diſperſed on his entering England, given the death of Barton as one of the cauſes of his invaſion, the lord admiral had prevailed with Henry to ſend him upon this ſervice; and he informed James by a letter, that he intended to juſtify the death of that pirate in the front of the Engliſh army.

366
James diſguſts ſeveral of his nobility.

By this time the army of James was, by deſertion and other cauſes, reduced to leſs than half its numbers; but the chief misfortune attending it was his own conduct. His indolence and inactivity, joined to the ſcandalous examples of his amours, at ſuch a ſeaſon, had diſguſted ſeveral of his greateſt men and beſt friends; and ſome of them more than ſuſpected a correſpondence between the Engliſh lady and the earl of Surry. James was deaf to all their remonſtrances; and the earl of Angus declared, that he was reſolved to return home, as he foreſaw that the ruin of the army was inevitable through

otland.

through the obſtinacy of James. He accordingly withdrew to Scotland, but left behind him his two ſons. The lord Hume and the earl of Huntley were likewiſe diſcontented. The former had brought his men into the field; but, according to ſome Scotch hiſtorians, with a deſign rather to betray than to ſerve James: but Huntley, though he diſliked his maſter's conduct, remained firmly attached to his perſon.

The defection or backwardneſs of thoſe great men ſeemed to make no impreſſion upon James. He had choſen a ſtrong camp in the neighbourhood of Ford, on the ſide of a mountain called Flodden hill; and he
367 camps an advantageous ſituation.
was ſeparated from the Engliſh army by the river Till. This advantageous ſituation put the earl of Surry under great difficulties; for it rendered the Scotch army inacceſſible, as it was fortified by artillery, and was now well ſupplied with proviſions by the change of its ſituation. The earl drew up a manifeſto, with which he charged Rouge Croix herald, who was attended by a trumpet. It contained ſome propoſals for an exchange of priſoners, which ſeems to have been calculated to give the lady Ford the more credit with James; but concluded with reproaches for his perfidious invaſion of England, and a defiance to James to fight him in a general battle. The herald was farther charged with a verbal commiſſion to acquaint James, that the earl of Surry had iſſued orders that no quarter ſhould be given to any of the Scotch army but the king himſelf.

A council of war was called on this occaſion; in which the earl of Huntley and others made ſtrong remonſtrances againſt a general engagement. They ſhowed how fatal it muſt be to Scotland, ſhould it prove unſucceſsful; and that the wiſeſt courſe James could follow was to return home, where, if he was purſued by the enemy, he could fight to great advantage. The earl of Huntley, however, added, that his opinion ſhould be determined by that of the king and council; and that he was equally ready to ſhare in his majeſty's danger as his glory.

Huntley and the other noblemen were oppoſed by the French ambaſſador, who repreſented a retreat as diſ-
368 ſolves fight trary to opinion of all officers.
graceful to the nobility of Scotland and the arms of James; and uſed many romantic arguments of the ſame kind, which but too well ſuited with the king's diſpoſition. According to Drummond, the council were of opinion, that the king ſhould immediately beſiege Berwick; but be that as it will, the majority of them were certainly of opinion, that it was beneath the dignity of James to fight the earl of Surry at that nobleman's requiſition, and that James could loſe no honour by returning home. Patrick Lord Lindſay of Byres, mentioned on a former occaſion, and who was preſident of the council, expreſſed himſelf ſo ſtrongly on that head, that James, in a paſſion, is ſaid by the hiſtorian Lindſay to have ſworn, that if ever he lived to return to Scotland, he would hang that nobleman at his own gate. He ordered Rouge Croix to be called in; and after treating him with great politeneſs, he ſent a meſſage to the earl of Surry by one of his own heralds (Iſlay), importing that he would give the Engliſh battle on the Friday following; and that had he received ſuch a meſſage from the earl even in his own caſtle of Edinburgh, he would have left that, and all other buſineſs to have fought him. With this meſſage, a ſmall manifeſto, in vindication of James's conduct, was ſent by the ſame herald.

Scot

The earl of Surry, who was then ſo infirm that he was carried about in a ſedan or chariot, had foreſeen that James would return an anſwer by one of his own heralds; but, unwilling that he ſhould obtain any knowledge of the ſituation of the Engliſh camp, he ordered proper perſons to receive him at two miles diſtance, where ſoon after he attended himſelf in perſon. Iſlay executed his commiſſion without paying much reſpect to the perſon of the Engliſh general; who diſmiſſed him, after beſtowing great compliments upon the honour and courage of James. The earl then ordered his army to march in line of battle towards Woollerhaugh. There he was joined by Rouge Croix, herald, who gave him an account of the ſtrong ſituation of the Scottiſh camp; but the advanced poſts of the Engliſh army were then within three miles of their enemies, and the earl of Surry found his difficulties daily increaſing. The roads were broken up, the ſwelling of the rivers cut him off from the neceſſary communications for ſupplying his army, and nothing but a battle could ſave him either from being diſbanded or deſtroyed.

James ſeems to have ſo far regarded the advice of his wiſeſt counſellors, as not to abandon his ſtrong ſituation. They endeavoured to perſuade him, that it was a ſufficient guard to his honour, if he did not decline the battle on the day appointed; and that his engagement did not bind him to fight upon diſadvantageous ground. The Scots, at the ſame time, knew of their enemy's diſtreſſes; and, as Drummond elegantly expreſſes it, they remonſtrated to their king, that he lacked nothing but patience to be victorious. The
His dent duct.
Scots thus lying on the defenſive, the earl of Surry again ſent Rouge Croix to inform James that he was ready to give him battle. James was ſenſibly nettled at this tacit imputation upon his honour, and perhaps was inwardly vexed for having followed the wiſe advice of his noblemen. It is certain, from the beſt authorities, that he neglected the neceſſary precautions for guarding the paſſages of the Till, which the Engliſh croſſed, partly at a place where it was fordable, and partly at a bridge. We are told, not without a great appearance of probability, that while the Engliſh were paſſing the bridge, Borthwick, maſter of the Scotch artillery, fell upon his knees, and begged permiſſion from James to point his cannon againſt the bridge; but that James anſwered him in a paſſion, that it muſt be at the peril of his (Borthwick's) head, and that he was reſolved to ſee all his enemies that day on the plain before him in a body. The earl of Surry, after paſſing the Till, took poſſeſſion of Braxton, which lay to the right of the Scotch camp; and by that ſituation he cut off the communication of his enemies with the Tweed, and commanded the Till below Eton caſtle. The Scotch generals ſaw themſelves now in danger of being reduced to the ſame ſtraits in which their enemies had been involved two days before, and their country open to an invaſion of the Engliſh army. James had ſecret intelligence that this was far from being the intention of the Engliſh general; and imagining that the latter's intention was to take poſſeſſion of a ſtrong camp upon a hill between him and the Tweed, which would give the Engliſh a farther command of the country, he reſolved to be beforehand

land.

forehand with the earl, and gave orders for making large fires of green wood, that the ſmoke might cover his march along the height, to take advantage of that eminence. But while this ſtratagem concealed his march from the Engliſh, their movements were concealed from him: for when he came to the brow of the height over which he had marched, he found the enemy drawn up in order of battle on the plain, but ſo cloſe to the height where he was, that his artillery, on which his great dependence was, muſt overſhoot them.

vo un of ttle of en.

A battle was now not only unavoidable, but the only means of ſaving the Scotch army, which was probably far from being a diſagreeable circumſtance to James. His perſon was ſo dear to his troops, that many of them dreſſed themſelves as nearly as they could in the ſame coats of armour and with the ſame diſtinctions that James wore that day. His generals had earneſtly deſired him to retire to a place of ſafety, where his perſon would be ſecure in all events: but he obſtinately refuſed to follow their advice; and on the ninth of September, early in the morning, diſpoſitions were ordered for the line of battle. The command of the van was allotted to the earl of Huntley; the earls of Lenox and Argyll commanded the Highlanders under James, who, ſome ſay, ſerved only as a volunteer; and the earls of Crawford and Montroſe led the body of reſerve. The earl of Surry gave the command of his van to his ſon, the lord admiral; his right wing was commanded by his other ſon, Sir Edward Howard; and his left by Sir Marmaduke Conſtable. The rear was commanded by the earl himſelf, Lord Dacres, and Sir Edward Stanley. Under thoſe leaders ſerved the flower of all the nobility and gentry then in England. Other writers give different accounts of the diſpoſition of the Engliſh army, but they may be reconciled by the different forms into which the battle was thrown before it was decided. The Lord Hume is mentioned as ſerving under the earls of Crawford and Montroſe, and Hepburn earl of Bothwel was in the rear.

The firſt motion of the Engliſh army was by the lord-admiral, who ſuddenly wheeled to the right, and ſeized a paſs at Milford, where he planted his artillery ſo as to command the moſt ſloping part of the aſcent where the Scots were drawn up; and it did great execution. The Scots had not foreſeen this manœuvre; and it put them into ſuch diſorder, that the earl of Huntley found it neceſſary to attack the lord-admiral; which he did with ſo much fury, that he drove him from his poſt; and the conſequence muſt have been fatal to the Engliſh, had not his precipitate retreat been covered by ſome ſquadrons of horſe under the lord Dacres, which gave the lord-admiral an opportunity of rallying and new forming his men. The earl of Surry now found it neceſſary to advance to the front, ſo that the Engliſh army formed one continued line, which galled the Scots with perpetual diſcharges of their artillery and bows. The Highlanders, as uſual, impatient to come to a cloſe fight, and to ſhare in the honour of the day, which they now thought their own, ruſhed down the declivity with their broadſwords, but without order or diſcipline, and before the reſt of the army, particularly the diviſion under Lord Hume, advanced to ſupport them. Their impetuoſity, however, made a conſiderable impreſſion upon the main battle of the Engliſh; and the king bringing up the earl of Bothwel's reſerve, the battle became general and doubtful: but by this time the lord-admiral, having again formed his men, came to the aſſiſtance of his father, and charged the diviſion under the earls of Crawford and Montroſe, who were marching up to ſupport the Highlanders, among whom the king and his attendants were now fighting on foot: while Stanley, making a circuit round the hill, attacked the Highlanders in the rear. Crawford and Montroſe, not being ſeconded, according to the Scotch hiſtorians, by the Humes, were routed; and thus all that part of the Scotch army which was engaged under their king, was completely ſurrounded by the diviſion of the Engliſh under Surry, Stanley, and the lord-admiral. In this terrible ſituation, James acted with a coolneſs not common to his temper. He drew up his men in a circular form, and their valour more than once opened the ranks of the Engliſh, or obliged them to ſtand aloof, and again have recourſe to their bows and artillery. The chief of the Scotch nobility made freſh attempts to prevail with James to make his eſcape while it was practicable; but he obſtinately continued the fight; and thereby became acceſſory to his own ruin, and that of his troops, whom the Engliſh would gladly have ſuffered to retreat. He ſaw the earls of Montroſe, Crawford, Argyll, and Lenox, fall by his ſide, with the braveſt of his men lying dead on the ſpot; and darkneſs now coming on, he himſelf was killed by an unknown hand. The Engliſh were ignorant of the victory they had gained: and had actually retreated from the field of battle, with a deſign of renewing it next morning.

Scot

The s defea and th king k

This diſaſter was evidently owing to the romantic diſpoſition of the king himſelf, and to the want of diſcipline among many of his ſoldiers; though ſome writers have aſcribed it to the treachery of Lord Hume. Many of James's domeſtics knew and mourned over his body; and it appeared that he had received two mortal wounds, one through the trunk with an arrow, and the other on the head with a ball. His coat of armour was preſented to Queen Catharine, who informed her huſband, then in France, of the victory over the Scots. The loſs on both ſides, in this engagement, is far from being aſcertained; though Polydore Virgil, who lived at the time, mentions the loſs of the Engliſh at 5000, and that of the Scots at 10,000.

The d dowag ſumes govern ment.

After the death of King James IV. the adminiſtration devolved on the queen-dowager; but ſhe being big with a poſthumous child, and unable to bear the weight of public buſineſs, accepted of Beaton archbiſhop of Glaſgow and chancellor of Scotland, with the earls of Huntley, Angus, and Arran, to aſſiſt her in the affairs of government. Soon after her huſband's death ſhe had wrote an affecting letter to her brother the king of England, informing him of her pregnancy, ſetting forth the deplorable ſtate of the kingdom, with her own condition, and imploring his friendſhip and protection for herſelf and her infant ſon. This letter ſeems never to have been communicated by Henry to his council; but he anſwered it, and informed his ſiſter, that if the Scots would have peace, they ſhould have peace, and war if they choſe it. "He added (according to Drummond), that her huſband had fallen by his own indiſcreet raſhneſs, and fooliſh kindneſs to France; that he regretted his death as his ally, and ſhould be willing to prohibit all hoſtility againſt the country of Scotland

Writ the ki Engla

during

during the minority of her son. For a remedy of present evils, one year's truce and a day longer was yielded unto; in which time he had leisure to prosecute his designs against France, without fear of being disturbed or diverted by the incursions and inroads of the Scots upon his borders."

374
Scot- affairs reat ufion.

Thus far Drummond: but though Henry might grant this time to his sister's entreaty, yet it certainly did not become a national measure: for it appears by a letter dated two years after, from the Scots council to the king of France, published by Rymer, that the Scots never had desired a truce. So far from that, the French influence, joined to a desire of revenge, remained so strong in the kingdom, that after the meeting of the parliament, some of the members were so violent as to propose a renewal of the war. This motion was indeed overruled by the more moderate part of the assembly: but they could not be brought to make any advances towards Henry for a peace; and every day was now big with public calamity, which seems to have gathered strength while the queen was in childbed. The archbishopric of St Andrew's being vacant, it was offered by universal consent to Elphinston bishop of Aberdeen; but being now old and infirm, he declined it. Three competitors for that high dignity then appeared. The first was Gawin Douglas, who was then abbot of Aberbrothic, to which he was presented by the queen upon her recovery (having been brought to bed of a son) the very day before her marriage with his nephew the earl of Angus: and upon the death of Bishop Elphinston in November following, she presented him likewise to the archbishopric of St Andrew's. The second competitor was John Hepburn, prior of St Andrew's; a bold, avaricious, restless, but shrewd and sensible priest. By his office he had received the rents of the see during its vacancy; and having prevailed with the canons, on pretence of ancient privileges, to elect him archbishop, without regard to the nomination either of the queen or pope, he drove Douglas's servants from the castle of St Andrew's, of which they had taken possession. The third and most powerful competitor was Forman bishop of Moray in Scotland, and archbishop of Bourges in France, a dignity to which he had been raised for his public services. He had in his interest not only the duke of Albany (son to the traitor duke) first prince of the blood, but also the court of Rome itself; and having received the pope's bull and nomination to the dignity, he was considered by the Scotch clergy in general, and by the principal tenants and dependants upon the see, as the legal archbishop.

The preference given to Forman discouraged Douglas from pursuing his pretensions; but Hepburn, being supported by the clan of his own name and by the Humes, made so formidable a head against his rivals, that none could be found daring enough to publish the papal bull in favour of Forman. The friends of the latter, however, having intimated to the earl of Hume, that his credit at the court of Rome could easily procure the rich abbey of Coldingham for his younger brother, the earl put himself at the head of his followers, and, notwithstanding all the opposition given by the Hepburns, he proclaimed the pope's bull over the cross of Edinburgh. This daring action plainly proved that the earl of Hume had more power than the queen regent herself; but Hepburn's resolution, and the greatness of his friends, obliged Forman to agree to a compromise. Hepburn was advanced to the see of Moray, without accounting for the revenues of the archbishopric, which he had received during its vacancy; and he gave Forman a present of three thousand crowns, to be divided among his friends and followers.

37
The q dowag marrie the ea Angu

In April 1514, the posthumous son, of whom the queen had been delivered in Stirling castle, was by the bishop of Caithness baptized Alexander. On the 6th of August this year she was married to the earl of Angus; than which nothing could be accounted more impolitic. She had neither consulted her brother nor the states of Scotland in the match; and by her having accepted of a husband, she in fact resigned all claim to the regency under the late king's will. The Douglasses did not dispute her having divested herself of the regency: but they affirmed, that the states might lawfully reinstate her in it; and that the peace of the kingdom required it, as it was the only measure that could preserve the happy tranquillity which then subsisted between Scotland and England. The earl of Hume put himself at the head of the opposition to this proposal. He knew that he had enemies, and he dreaded that the further aggrandizement of Angus must weaken his interest on the borders. He was joined by a number of the young nobility, who, though otherwise divided, united against Angus. In short, the general opinion was, that the Douglasses were already too great; and that, should the queen be reinstated in the regency, they must be absolute within the kingdom, and engross all places of power and profit. It was added by the earl of Hume, that he had, out of respect to the late king's memory, submitted to the queen's government; and that, now she had made a voluntary abdication of it by her marriage, it ought not to be renewed.

37
The d of All chosen gent.

After some deliberations the duke of Albany was chosen regent. He was a man possessed of all the qualities requisite for a good governor; nor did he deceive the expectations of the public. On his arrival at Glasgow, he took upon him the titles of earl of March, Marr, Garioch, lord of Annandale, and of the isle of Man, regent and protector of the kingdom of Scotland. On his arrival at Edinburgh he was received in form by the three estates of the kingdom, and the queen had met him at some distance from the town. The parliament then resumed its session, and the three estates took an oath of obedience, till the king, then an infant of four years old, should arrive at the years of maturity.

The first thing at which the regent aimed, was the conciliating the differences amongst the various contending families in the kingdom; at the same time that he suppressed some daring robbers, one of whom is said to have had no fewer than 800 attendants in his infamous profession. So great was his love of good order and decency, that he punished the lord Drummond with the loss of his estate for having struck Lyon king at arms, whose person, as the first herald in Scotland, ought to have been held sacred. Nay, it was at the earnest solicitation of Lyon himself, and many of the chief nobility, that a greater punishment was not inflicted. However, the forfeiture was afterwards

remitted;

remitted; but not before Drummond had, upon his knees, acknowledged his offence, and submitted himself before Lyon.

77
The regent had not been long in office before he took into favour Hepburn the prior of St Andrew's, whom he consulted for information concerning the state of Scotland. Hepburn acquainted him with all the feuds and animosities which raged among the great families of Scotland, their ferocious character, and barbarous behaviour to their enemies. He represented the civil power as too weak to curb these potent chieftans; and gave it as his opinion that the regent's administration ought to be supported by foreign arms, meaning those of France.

78
Hepburn is said also to have gained an ascendency over the regent by means of large sums of money laid out among his domestics, by a fawning and plausible address, and by well directed flatteries; and he employed this ascendency to destroy those who were obnoxious to himself. The earl of Hume, as being the first subject in rank and authority, became obnoxious to the regent through the insinuations of Hepburn; and as that nobleman had frequent occasion to be at court in virtue of his office of chamberlain, he soon perceived that neither he nor his friends were welcome guests there. Alarmed for his own safety, he resolved to form a party alongst with the queen-mother and her new husband against the regent. This was by no means a difficult task; for the queen naturally imagined that her new husband ought to have had some share in the government; and the earl of Angus readily concurred in the scheme. In the mean time, the regent was making a progress through Scotland, while bloody feuds were raging among the nobles: but before any remedy could be applied to these disorders, he was informed of the schemes laid by the queen-mother and her party; and that she had resolved to fly into England with her two infants. On this he instantly returned to Edinburgh; and, as no time was to be lost, set out at midnight that very night, and surprised the castle of Stirling, where he found the queen-mother and her two infants.

The regent, after this bold step, took care to show that the care of the royal infants was his chief study. As he himself was nearly allied to the crown, in order to remove all suspicions and calumnies on that account, he committed the care of the king and his brother to three noblemen of the most unexceptionable characters in the kingdom, but of whom we now know the name only of one, viz. the earl of Lenox. They were appointed to attend the princes by turns; to whom also a guard, consisting partly of French and partly of Scots, was assigned; and the queen-mother was left at liberty to reside where she pleased.

79
The earl of Hume, finding his schemes thus abortive, retired to his own estate; from whence he was soon after drawn, and obliged to fly into England, by the earls of Arran and Lenox. The queen-mother retired to a monastery at Coldstream; and messengers were despatched to the court of England, to know how Henry would have his sister disposed of. He ordered the lord Dacres, his warden of the marches, to attend her to Harbottle castle in Northumberland; and here she was delivered of her daugher the Lady Mary Douglass, mother to Henry Lord Darnly, father to James I. of England. The regent despatched ambassadors to Henry, in order to vindicate his own conduct. He likewise sent to assure the queen that she had nothing to fear in Scotland; and to invite her to return thither, where she should at all times be admitted to see her children. This offer, however, she declined; and set out for London, where she was affectionately received and entertained by her brother. But in the mean time many disorders were committed throughout the kingdom by the party of the queen-mother; though, by the interposition of Archbishop Forman, they were at present terminated without bloodshed, and some of the principal offenders were persuaded to return to their duty. Among these was the earl of Angus himself, the queen's husband; which when King Henry heard, he exclaimed, "That the earl, by deserting his wife, had acted *like a Scot.*" Lord Hume refused to surrender himself, or to accept of the regent's terms; and was of consequence declared a traitor, and his estate confiscated. All this time he had been infesting the borders at the head of a lawless banditti; and now he began to commit such devastations, that the regent found it necessary to march against him at the head of 1000 disciplined troops. Hume being obliged to lay down his arms, was sent prisoner to Edinburgh castle; where the regent very unaccountably committed him to the charge of his brother-in-law the earl of Arran. Hume easily found means to gain over this near relation to his own party; and both of them, in the month of October 1515, escaped to the borders, where they soon renewed hostilities. Both the earls were now proclaimed traitors, but Hume was allowed fifteen days to surrender himself. This short interval the regent employed in quashing the rebellion, for which purpose the parliament had allowed him 15,000 men. He besieged the castle of Hamilton, the earl of Arran's chief seat, which was in no condition of defence: but he was prevailed upon by Arran's mother, daughter to James II. and aunt to the regent himself, to forbear further hostilities, and even to pardon her son, provided he should return to his duty. Arran accordingly submitted; but the public tranquillity was not by that means restored. An association, at the head of which was the earl of Moray, the king's natural brother, had been formed against the earl of Huntley. That nobleman was too well attended, to fear any danger by day; but his enemies found means to introduce some armed troops in the night-time into Edinburgh. On this a fierce skirmish ensued, in which some were killed on both sides; but farther bloodshed was prevented by the regent, who confined all the lords in prison till he had brought about a general reconciliation. One Hay, who had been very active in stirring up the quarrels, was banished to France; and only the earl of Hume now continued in arms.

In 1516 died the young duke of Rothsay: an event which brought the regent one degree nearer the crown, so that he was declared heir in case of the demise of young James. Negotiations were then entered into about prolonging the truce which at that time subsisted with England; but Henry insisting upon a removal of the regent from his place, they were for the present dropped. Finding, however, that he could neither prevail on the parliament as a body to dismiss the regent, nor form a party of any consequence against him, he,

he at last consented to a prolongation of the truce for a year.

83 In 1517, the affairs of the regent requiring his presence in France, he resolved, before his departure, to remove the earl of Hume, who, as we have seen, alone continued to disturb the public tranquillity. Under pretence of settling some differences which still remained with England, he called a convention of the nobility and sent special letters to the earl of Hume and his brother to attend, on account of their great knowledge in English affairs. Both of them imprudently obeyed the summons, and were seized and executed as soon as they arrived at Edinburgh. But whatever occasion there might be for this severity, it lost the affections of the people to such a degree, that the regent could scarce get the place filled up which Lord Hume had possessed. That of lord warden of the marches he at last gave to his French favourite La Beaute, called by historians Sir Anthony D'Arcy. The post of lord chamberlain was given to Lord Fleming. Soon after this, the regent levied an army, on pretence of repressing some disturbances on the borders. These being speedily quelled, he seized on his return upon the earl of Lenox, and forced him to deliver up his castle of Dumbarton; not choosing to leave it, during his intended absence in France, in the custody of a nobleman of suspected fidelity; and from similar motives, he afterwards took him along with him on his departure for the continent. He then procured himself to be nominated ambassador to France, in which character he left the kingdom; having committed the government to the archbishops of St Andrew's and Glasgow, the earls of Arran, Angus, Huntley, and Argyll, with the warden D'Arcy, on whom was his chief dependence.

84 On the departure of the regent, the queen-mother left the English court; and arrived with a noble retinue at Berwick, on purpose to visit her son. Here she was received by her husband; for whom she had contracted an invincible aversion, either on account of his infidelities to her bed, or because he had deserted her in the manner already related. However, she suppressed her resentment for the present, and accompanied him to Edinburgh. Here, in consequence of the proposals made by the regent, she demanded access to her son; but was refused by D'Arcy. Lord Erskine, however, who was one of those to whom the care of the young king was committed, conveyed him to the castle of Craigmillar (where D'Arcy had no jurisdiction), on pretence that the plague was in Edinburgh; and there the queen was admitted; but this gave such offence to D'Arcy, that Lord Erskine was obliged to carry back the king to the castle of Edinburgh, where all further access was denied to his mother. In short, the behaviour of this favourite was on all occasions so haughty and violent, that he rendered himself universally odious; and was at last murdered, with all his attendants, in his way to Dunse, where he proposed to hold a court of justice.—His death was very little regretted; yet his murderers were prosecuted with the utmost severity, and several persons of distinction declared rebels on that account.

Meanwhile, the regent was treated with high marks of distinction in France. The king showed him the greatest respect, promised to assist in establishing his authority in Scotland, and solemnly confirmed the ancient league between the two kingdoms. Soon after, the earl of Lenox arrived from France, with assurances of protection and assistance from the king, who was highly pleased at the zeal of the governors in punishing D'Arcy's murderers; and 500 soldiers arrived with him, to reinforce the garrisons, especially that of Dunbar.

35 All this time the queen-mother continued at Edinburgh, employing herself in attempts to procure a divorce from her husband, under pretence of his having been previously contracted to another. The affairs of the kingdom again began to fall into confusion, and many murders and commotions happened in different parts of the country. The earl of Arran had the chief direction in the state; but the earl of Angus, notwithstanding the difference with his wife, had still great interest, and waited every opportunity to oppose him. This emulation produced an encounter at Edinburgh; in which victory declared for Angus, and 72 of the routed party were killed. This skirmish was fought on the 30th of April 1519, and has been known in Scots history by the name of *Cleanse the Causeway*.

On the 19th of November 1521, the regent returned from France. He found the kingdom in great disorder. The earl of Angus domineered in the field, but his antagonists outvoted his party in the parliament. The queen-mother, who had fixed her affections on a third husband, hated all parties almost equally; but joined the duke of Albany, in hopes of his depriving the other two of their power. This happened according to her expectation; and she was with the regent when he made a kind of triumphal entry into Edinburgh, attended by a number of persons of the first rank.—The earl of Angus was now summoned to appear as a criminal, but his wife interceded for him, not out of any remains of affection, but because he gave her no opposition in the process of divorce which was depending between them. In the mean time, Henry VIII. of England, perceiving that the Scots were entirely devoted to the French interest, sent a letter full of accusations against the regent, and threats against the whole nation, if they did not renounce that alliance. No regard being paid to these requisitions, Lord Dacres was ordered to proclaim upon the borders, that the Scots must stand to their peril if they did not fall in with his measures by the first of March 1522. This producing no effect, Henry seized the effects of all the Scots residing in England, and banished them his dominions, after marking them, according to Bishop Lesley, with a cross, to distinguish them from his other subjects. A war was the unavoidable consequence of these proceedings; and, on the 30th of April, the earl of Shrewsbury, Henry's steward of the household, and knight of the garter, was appointed commander in chief of the army that was to act against the Scots; and, in the mean time, Lord Dacres made an inroad as far as Kelso, plundering and burning wherever he came.

The regent ordered his army to rendezvous at Roslin; but the Scots, remembering the disaster at Flodden, showed an extreme aversion to the war, and even told the regent to his face, that though they would defend themselves in case they were attacked, they would not engage in a French quarrel. The regent remonstrated,

tland. strated, but without effect; and as the malecontents continued obstinate, he was in danger of being left by himself, when the queen-mother interposed, and prevailed upon Lord Dacres to agree to a conference, the event of which was a renewal of the negotiations for peace.

389 regent to ...ce for ...ance. The regent perceiving, by the disgrace of this expedition that he had lost his former popularity, determined to revenge himself; and therefore told those whom he could trust, that he was about to return to France, from whence he should bring such a force by sea and land, as should render it unnecessary for him to ask leave of the Scots any more to invade England. Accordingly he embarked for France on the 25th of October, but publicly gave out that he would return the ensuing August.

On the regent's arrival in France, he made a demand of 10,000 foot, and 5000 horse for carrying on the war against England; but the situation of King Francis did not then allow him to spare so many at once, though he was daily sending over ships with men, ammunition and money, for the French garrisons in

390 Eng- ...resolve ...tercept Scotland. At last it was publicly known in England that the regent was about to return with a strong fleet, and 4000 of the best troops in France; upon which Henry determined, if possible, to intercept him. Sir William Fitz-Williams, with 36 large ships, was ordered to block up the French squadron in the harbour of Finhead; Sir Anthony Poyntz cruised with another in the Western seas, as Sir Christopher Dow and Sir Henry Shireburn did in the northern with a third squadron. The duke of Albany, being unable to cope with Fitz-Williams, was obliged to set out from another port with 12 ships, having some troops on board. They fell in with Fitz-Williams's squadron; two of their ships were sunk, and the rest driven back to Dieppe. Fitz-Williams then made a descent at Treport, where he burnt 18 French ships, and returned to his station off Finhead. By this time the French had given the duke such a reinforcement as made him an overmatch for the English admiral, had the men been equally good; but the regent had no dependence upon

391 ...utwits ...n, and ...s in ...land. French sailors when put in competition with the English. Instead of coming to an engagement, therefore, as soon as Fitz-Williams appeared, he disembarked his soldiers, as if he had intended to delay his expedition for that year; but a storm soon arising, which obliged the English fleet to return to the Downs, the regent took that opportunity of reimbarking his men, and sailing by the western coasts arrived safe in Scotland.

392 ...l deva- ...ons of Eng- All this time the earl of Surry had been carrying on the most cruel and destructive war against Scotland; insomuch that, according to Cardinal Wolsey, "there was left neither house, fortress, village, tree, cattle, corn, nor other succour for man," in the counties of Tweeddale and March. The regent's return did not immediately put a stop to these devastations; for the intestine divisions in Scotland prevented him from taking the field. His party was weakened by his long absence, and the queen-mother had been very active in strengthening the English interest. A parliament was called in 1523, where it was debated, Whether peace or war with England should be resolved on? and the determinations of this parliament were evidently on the worst side of the question. Henry was at this time so

well disposed to cultivate a friendship with Scotland, that he offered to James his eldest sister Mary in marriage; but the Scots animated by the appearance of their French auxiliaries, and corrupted by their gold, rejected all terms and resolved upon war. However when the army was assembled, and had advanced to the borders, he found the same difficulty he had formerly experienced; for they flatly refused to enter England. With greatly difficulty he prevailed upon part of the army to pass the Tweed; but not meeting with success, he was obliged to return to Scotland, which at this time was divided into four factions. One of these was headed by the regent, another by the queen, a third by the earl of Arran, and a fourth by the earl of Angus, who had lived as an exile under Henry's protection. Had it been possible for the earl of Angus and his wife to have been reconciled to each other, it would have been much for the interest of the kingdom; but all the art even of Cardinal Wolsey could not effect this. At last the duke of Albany, finding all parties united against him, resigned his office of regent of Scotland. On the 14th of March that year he went on board one of his own ships for France, from whence he never returned to Scotland. He did not indeed make a formal abdication of his government: so far from that, he requested the nobility, whom he convened for that purpose, to enter into no alliance with England during his absence, which he said would continue no longer than the first of September following; to make no alteration in the government; and to keep the king at Stirling.

The nobility, who were impatient for the absence of the regent, readily promised whatever he required, but without any intention of performing it: nor, indeed, was it in their power to comply; for it had been previously determined that James himself should now take the administration into his own hands. According to Buchanan, the regent had no sooner returned to France than Scotland relapsed into all the miseries of anarchy. The queen-dowager had the management of public affairs, but her power was limited. The earl of Arran, apprehending danger from the English, entered into the views of the French party. The queen-mother's dislike to her husband continued as great as ever, which prevented an union among those who were in the English interest; and Wolsey took that opportunity of restoring the earl of Angus to all his importance in Scotland.— The queen-mother, therefore, had no other way left to keep herself in power, but to bring James himself into action. On the 29th of July, therefore, he removed from Stirling to the abbey of Holyroodhouse: where he took upon himself the exercise of government, by convoking the nobility, and obliging them to swear allegiance to his person a second time. The truce with England was now prolonged, and the queen's party carried all before them. On the very day on which the last truce was signed with England, the earl of Angus entered Scotland. He had been invited from his exile in France into England, where he was caressed by Henry, who disregarded all his sister's entreaties to send him back to France, and now resolved to support him in Scotland. Yet though his declared intention in sending the earl to Scotland was, that the latter might balance the French party there, the king enjoined him to sue, in the most humble manner, for a reconciliation with

with his wife, and to co-operate with the earl of Arran, who now acted as prime miniſter, as long as he ſhould oppoſe the French party. On his return, however, he found himſelf excluded from all ſhare in the government, but ſoon found means to form a ſtrong party in oppoſition to Arran. In the mean time, ambaſſadors were ſent to the court of England, in order
7 to treat of a perpetual peace between the two nations. At the ſame time a match was propoſed between the young king of Scotland and Henry's daughter. This had originally been a ſcheme of Henry himſelf; but the emperor Charles V. had reſolved to outbid him, by offering James a princeſs of his own family, with an immenſe treaſure. The ambaſſadors arrived at London on the 19th of December, and found Henry very much diſpoſed both to the peace and to the match. Commiſſioners were appointed to treat of both; but they were inſtructed to demand by way of preliminary, that the Scots ſhould abſolutely renounce their league with France, and that James ſhould be ſent for education to England till he ſhould be of proper age for marriage. The Scottiſh commiſſioners declared, that they had no inſtructions on theſe points: but one of them, the earl of Caſſilis, offered to return to Scotland, and bring a definitive anſwer from the three ſtates; and in the mean time the truce was prolonged to the 15th of May 1525.
93 On his arrival at Edinburgh, he found the earl of Angus the leading man in parliament, by whoſe influence it was determined that the Scots ſhould renounce their league with France, and ſubſtitute in place of it a ſimilar league with England; and that the king ſhould be brought up at the Engliſh court till he was of an age proper for marriage: but at the ſame time they required of Henry to break off all engagements with Charles V. who was the bitter enemy of Francis, and at that time detained him priſoner. To this the Engliſh monarch returned but a cold anſwer, being then engaged in a number of treaties with the emperor, among which was one concerning the marriage of the princeſs Mary with his imperial majeſty himſelf, however, before Caſſilis returned, a truce of two years and a half was concluded between England and Scotland.

99 But now the queen mother, though ſhe had always been a warm advocate for an alliance between the two nations, yet diſliked the means of bringing it about.—She ſaw her huſband's party increaſing every day in power; ſo that now ſhe had no other reſource than in keeping poſſeſſion of the king's perſon, whom ſhe removed to the caſtle of Edinburgh. Being now under the neceſſity of convening a parliament, it was reſolved to hold it within the caſtle; which, being an unconſtitutional meaſure, gave a great handle to the earl of Arran and his party to complain of the innovation. They began with remonſtrances; but finding them ineffectual, they formed a blockade of the caſtle with 2000 men, and cut off all communication of the town by means of trenches. As no proviſions could thus be got into the caſtle, the queen ordered ſome of the cannon to be turned againſt the town, in order to force the citizens to put an end to the blockade. Several ſhot were fired: but when all things appeared ready for a civil war, matters were compromiſed, though in ſuch an imperfect manner as left very little room to hope for perfect tranquillity. It was agreed, that the king ſhould remove out of the caſtle of Edinburgh to the palace of Holyroodhouſe; from whence he ſhould repair with all poſſible magnificence to his parliament, in the houſe where it was commonly held; and there a finiſhing hand was to be put to all differences. This agreement was ſigned on the 25th of February 1526. The parliament accordingly met, and the king's marriage with the princeſs of England was confirmed; but no mention was made of the king's being ſent for his education into that country; on the contrary, he was committed to the care of eight lords of parliament. Theſe were to have the cuſtody of the king's perſon, every one his month ſucceſſively, and the whole to ſtand for the government of the ſtate; yet with this limitation, "that the king, by their counſel, ſhould not ordain or determine any thing in great affairs to which the queen, as princeſs and dowager, did not give her conſent." This partition of power, by giving the queen a negative in all public matters, ſoon threw every thing into confuſion. The earl of Angus, by leading the king into various ſcenes of pleaſure and diſſipation, ſo gained the aſcendency over him, that he became in a manner totally guided by him. The queen-mother, perceiving that ſhe could not have acceſs to her ſon, without at the ſame time being in company with her huſband, whom ſhe hated, retired ſuddenly with her domeſtics to Stirling. Thus the king was left under the ſole tuition of the earl of Angus, who made a very bad uſe of his power, engroſſing into his own hands, or thoſe of his friends, all the places of honour or profit. The archbiſhop of St Andrew's, having now joined the king's party, adviſed her to make a formal demand upon her huſband, that the order of government which had been ſettled laſt parliament ſhould take place, and that under a penalty he ſhould ſet the king at liberty. To this the earl anſwered by a kind of manifeſto drawn up by his brother; in which he declared, that "the earl of Angus having been ſo highly favoured by his good uncle the king of England, and that James himſelf being under great obligations to him, neither the queen nor the other lords need be in any pain about him, as he choſe to ſpend his time with the earl of Angus rather than with any lord in the kingdom." James himſelf, however, had diſcernment ſufficient to perceive, that, notwithſtanding all the fair pretences of the earl of Angus, he was in fact no better than his priſoner; and reſolved to attempt the recovery of his liberty. The earls of Argyle and Arran had for ſome time retired from court, where they had no ſhare in the adminiſtration, and were living on their own eſtates; but the earl of Lenox diſſembled his ſentiments ſo well, that he was neither ſuſpected by the earl of Angus, nor any of the Douglas family, who were his partizans. The king being gained upon by his inſinuating behaviour, opened his mind to him, and requeſted his aſſiſtance againſt his treacherous keepers. At the ſame time he ſent letters to his mother, and the heads of her party, by ſome of his domeſtics whom Lenox had pointed out, entreating them to remove him from the earl, and not ſuffer him any longer to remain under his imperious juriſdiction; adding, that if this could not be done by any other means, they ſhould uſe force of arms.

On receiving this letter, the queen and her party aſſembled their forces at Stirling, and without loſs of time began their march for Edinburgh. Angus, on the other hand, prepared to give them a warm reception,

tion, but at the same time to carry along with him the king. This resolution being made known to the queen-
404 mother, she was so much concerned for the safety of her son, that the whole party disbanded themselves; and thus the authority of the earl of Angus seemed to be more established than ever. Nothing, indeed, was now wanting to render him despotic but the possession of the great seal, which the archbishop of St Andrew's had carried with him to Dunfermline. As no deed of any consequence could be executed without this, he prevailed upon the king to demand it by a special message;
405 in consequence of which, the archbishop was obliged to give it up. About this time the divorce which had been so long in agitation between the queen-mother and the earl of Angus actually took place; which, no doubt, increased the dislike of James to his confinement, while the imprudence of Angus gave every day fresh matter of disgust. As Angus knew that he had no firm support but in the attachment of his followers to his person, he suffered them to rob and plunder the estates of his opponents without mercy. These, again, did not fail to make reprisals; so that, towards the end of the year 1526, there was scarcely any appearance of civil government in Scotland. Thus the court became almost totally deserted; every nobleman being obliged to go home to defend his own estate. Even Angus himself shared in the common calamity, and hence was frequently obliged to leave the king to the custody of Lenox. To this nobleman the king now made the
406 most grievous complaints, and charged him to contrive some plan for his escape. Lenox accordingly recommended to him the baron of Buccleugh, who was very powerful in the southern parts, and a violent enemy to Angus and the whole family of Douglas. To him he gave orders to foment the disorders in the southern parts to such a degree as to require the king's personal presence to compose them. Buccleugh was then to attack the party, and take the king by force from the Douglasses. This scheme was put in execution, but Buccleugh had the misfortune to be defeated; so that the attempt proved abortive, and James found himself in a worse situation than ever. After this attempt, however as the earl of Angus could not but know that Lenox had been accessory to it, the former behaved towards him with such visible indifference, that Lenox openly declared against him, and advised the king to form a friendship with the archbishop of St Andrew's, in order to effect his liberty. This was accordingly done; but the interest of the archbishop and Lenox was overbalanced by that of Arran and the Hamilton
407 family, whom the earl of Angus now drew over to his party. However, the earl of Lenox, having received powers from the king for that purpose, suddenly retired from court; and published a manifesto, inviting all loyal subjects to assist him in delivering the king from confinement. In consequence of this he was soon joined by a numerous army, with whom he advanced towards Edinburgh. Angus did not fail to assemble his adherents; and sent orders to the inhabitants of Edinburgh to take the field, with the king at their head. The citizens immediately put themselves under arms; but James, pretending to be indisposed, Sir George Douglas, brother to the earl of Angus, made him the following speech: "Sir, rather than our enemies should take you from us, we will lay hold of your person; and should you be torn in pieces in the struggle, we will carry off part of your body." Upon this speech, which James never forgot, he mounted his horse and set forward to Linlithgow, but with a very slow pace; insomuch that Sir George Douglas, afraid of not coming in time to succour his brother, made use of many indecent expressions and actions to push James on to the field of battle. Three expresses arrived from the earl of Angus; the first informing his brother that he was about to engage with a superior army; the second that Angus was engaged with a division of Lenox's army, commanded by the earl of Glencairn; and that Lenox himself was engaged with the Hamiltons. The third informed him that Lenox, if not actually defeated, was on the point of being so. Upon receiving this last news, James hastened to the field of battle, that he might save Lenox, and put an end to the bloodshed.—But he came too late: for the royal party was already defeated with great slaughter; and Lenox himself, after being wounded and taken prisoner, was murdered by Sir James Hamilton.

On the night of the battle, the king was removed to Linlithgow; and though he was under the greatest grief for the fate of Lenox, the behaviour of the Douglasses struck him with such terror that he dissembled his sentiments. The earl of Angus led his victorious troops into Fife, in hopes of surprising the queen and the archbishop of St Andrew's. The queen, on the news of his approach, fled, with her new husband Henry Stuart, brother to Lord Evandale, to Edinburgh, and both were admitted into the castle. The archbishop fled to the mountains, where he was obliged to keep cattle as a shepherd. Angus after having plundered the castle of St Andrew's and the abbey of Dunfermline, returned in triumph to Edinburgh, where he prepared to besiege the castle; but the queen, hearing that her son was among the number of the besiegers, ordered the gates of the castle to be thrown open, and surrendered herself and her husband prisoners to James, who was advised to confine them to the castle. After these repeated successes, the earl of Angus established a kind of court of justice, in which he prosecuted those who had opposed him, among whom was the earl of Cassilis. He was offered by Sir James Hamilton, natural son to the earl of Arran, the same who had murdered Lenox, an indemnity if he would own himself a vassal of that house; but this condition was rejected. Being called to his trial, and accused of having taken arms against the king, a gentleman of his name and family, who was his advocate, denied the charge, and offered to produce a letter under James's own hand, desiring him to assist in delivering him from his gaolers. This striking evidence confounded the prosecutor so much, that the earl was acquitted; but on his return home he was way-laid and murdered by one Hugh Campbell, at the instigation of Sir James Hamilton.

During these transactions in the south, many of the Highland clans were perpetrating the most horrid scenes of rapine and murder, which in some places reigned also in the Lowlands. The state of the borders was little better than that of the Highlands; but it engaged the attention of Angus more, as he had great interest in these parts. Marching therefore, against the banditti which infested these parts, he soon reduced them to reason. His power seemed now to be firmly established, insomuch

insomuch that the archbishop of St Andrew's began to treat with Sir George Douglas, to whom he offered lucrative leases and other emoluments if he would intercede with the regent, as Angus was called, in his favour. This was readily agreed to; and the archbishop was allowed to return in safety to his palace about the same time that Angus returned from his expedition against the borderers. Nothing was then seen at court but festivities of every kind, in which the queen-mother, who was now relieved from her confinement, took part: and she was afterwards suffered to depart to the castle of Stirling; which Angus, not attending to its value, had neglected to secure. In the mean time the archbishop invited the Douglasses to spend some days with him at his castle; which they accordingly did, and carried the king along with them. Here James dissembled so well, and seemed to be so enamoured of his new way of life, that Angus thought there could be no danger in leaving him in the hands of his friends till he should return to Lothian to settle some public as well as private affairs. Having taken leave of the king, he left him in the custody of his uncle Archibald, his brother Sir George, and one James Douglas of Parkhead, who was captain of the guards that watched his majesty on pretence of doing him honour. The earl was no sooner gone than the archbishop sent an invitation to Sir George Douglas, desiring him to come to St Andrew's, and there put the last hand to the leases, and finish the bargains that had been spoken of between them. This was so plausible, that he immediately set out for St Andrew's; while his uncle the treasurer went to Dundee, where he had an amour. James thinking this to be the best opportunity that ever presented to him for an escape, resolved to avail himself of it at all events; and found means, by a private message, to apprise his mother of his design. It was then the season for hunting and diversion, which James often followed in the park of Falkland; and calling for his forrester, he told him, that as the weather was fine, he intended to kill a stag next morning, ordering him at the same time to summon all the gentlemen in the neighbourhood to attend him with their best dogs. He then called for his chief domestics, and commanded them to get his supper early, because he intended to be in the field by day-break; and he talked with the captain of his guard of nothing but the excellent sport he expected next morning. In the mean time, he had engaged two young men, the one a page of his own, the other John Hart, a helper about his stables, to attend him in his flight, and to provide him with the dress of a groom for a disguise. Having formally taken leave of his attendants, charging them to be ready early in the morning, and being left alone, he stole softly out of his bed-chamber, went to the stable unperceived by the guards, dressed himself in his disguise; and he and his companions mounting the three best horses there, galloped to Stirling castle; into which, by the queen's appointment, he was admitted soon after day-break. He commanded all the gates to be secured; and the queen having previously prepared every thing for a vigorous defence, orders were given that none should be admitted into the castle without the king's permission.

About an hour after the king escaped from Falkland, Sir George Douglas returned; and being assured that his majesty was asleep, he went to bed. It appears that James had been seen and known in his flight; for in the morning the bailiff of Abernethy came post-haste to inform Sir George that the king had passed Stirling bridge. They had, however, some glimmering hope that the king might be gone to Bambrigh: but that surmise was soon found to be false; and an express was despatched, informing Angus of all that had happened. The earl quickly repaired to Falkland, where he and his friends came to a resolution of going to Stirling, and demanding access to the king.

James by this time had issued letters to the earls of Huntley, Argyll, Athol, Glencairn, Menteith, Rothes, and Eglinton; the lords Graham, Levingston, Lindsay, Sinclair, Rothven, Drommond, Evandale, Maxwell, and Semple. Before all of them could arrive at Stirling, the earl of Angus and his friends were upon their journey to the same place; but were stopped by a herald at arms, commanding them on their allegiance not to approach within six miles of the king's residence. This order having sufficiently intimated what they were to expect, the earl deliberated with his party how to proceed. Some of them were for marching on and taking the castle by surprise: but that was found to be impracticable, especially as they had no artillery. The earl and his brother therefore resolved to make a show of submission to the king's order; and they accordingly went to Linlithgow. By this time all the nobility already mentioned, and many others, had assembled at Stirling; and James, calling them to council, inveighed against the tyranny of the Douglasses with an acrimony that sufficiently discovered what pain it must have given him when he was obliged to bear it in silence. He concluded his speech with these words: "Therefore I desire, my lords, that I may be satisfied of the said earl, his kin, and friends. For I vow that Scotland shall not hold us both, while I be revenged on him and his."

The result of the council's deliberation was, that proclamation should be made, renewing the order for the Douglasses not to approach the court, and divesting the earl of Angus and his brother of all their public employments. In the mean time, such was the moderation of the assembly, that by their advice James ordered the earl to retire to the north of the Spey till his pleasure should be known; but his brother was commanded to surrender himself a prisoner in the castle of Edinburgh, to take his trial in a very full parliament (all the members being summoned to attend), to be held in that city next September. The earl and his brother considered their compliance with those conditions as a prelude to their destruction; and resolved to justify their treasons by still greater excesses, in surprising the town of Edinburgh, and holding it against the king and parliament, before the latter could assemble. Historians have not done that justice to the proceedings of the royal party on this occasion which they deserve. The management of the king's escape, his reception into Stirling, the fortifying that castle, and the ready obedience of his great nobility, some of whom attended him with their followers before they received any summonses for that purpose, are proofs of wise and spirited deliberations. Their conduct at this time was equally consistent with the same plan of foresight.

It was naturally to be supposed that the Douglasses, who remained assembled in a numerous body, would

make the attempt already mentioned; but the royalists had the precaution to despatch the Lord Maxwell and the baron of Lochinvar, with a body of troops, to take possession of the town, till James could arrive with 2000 forces to their relief. Maxwell and Lochinvar made such despatch, that they were in possession of the town when the Douglasses appeared before it, and repulsed them; while a most terrible storm had scattered the troops under James before he could come to their assistance, so effectually, that, being left almost without attendants, his person might have been taken by the smallest party of the enemy. Upon the retreat of the Douglasses from Edinburgh, the parliament met; and none of them appearing in pursuance of their summons, the earl of Angus, his brother Sir George Douglas, his uncle Archibald Douglas, and Alexander Drummond of Caruock, with some of their chief dependents, were indicted and forfeited for the following offences: "The assembling of the king's lieges, with intention to have assailed his person; the detaining of the king against his will and pleasure, and contrary to the articles agreed upon, for the space of two years and more; all which time the king was in fear and danger of his life.' We know of no advocate for the earl and his friends but one Banantyne, who had the courage to plead their cause against those heinous charges; and so exasperated were both the king and parliament against them, that the former swore he never would forgive them, and the latter that they never would intercede for their pardon. Thus it was not deemed sufficient simply to declare their resolutions; but the solemnity of oaths was added with an intention to discourage the king of England from continuing the vigorous applications he was every day making, by letters and otherwise, for the pardon of Angus; and to shut out all hopes of that kind, James created his mother's third husband (to whom she had been married for some time) Lord Methven, and gave him the direction of his artillery.

The disgrace and forfeiture of the Douglasses having created many vacancies in the state, Gavin Dunbar, archbishop of Glasgow, and tutor to the king, was nominated lord chancellor, though but indifferently qualified for a post that ought to have been filled by an able statesman; and Robert Carncross, a person (says Buchanan) more eminent for wealth than virtue, was made treasurer: but this last was soon after displaced, being suspected of favouring the Douglasses; and Robert Barton, one of the king's favourites, was appointed to succeed him. The Douglasses still kept their arms; and being joined by a great number of outlaws and robbers in the south, they ravaged all the lands of their enemies, carrying their devastations to the very gates of Edinburgh. A commission of lieutenancy was offered to the earl of Bothwell to act against those rebels: but he declining it, it was accepted by the earl of Argyll and Lord Hume, who did great service in protecting the country from the outlaws. Several villages, however, in the neighbourhood of Edinburgh, were burnt; and all the provisions the Douglasses could find were carried off to their castle of Tantallon, which now served as their head-quarters, and was threatened with a siege.

It is remarkable, that the castle of Dunbar remained still in the hands of the duke of Albany's garrison, who recognized no master but him. The place was well stored with artillery of all kinds; and lying in the neighbourhood of Tantallon, it was easy to transport them to the siege: but James thought he had no right to make use of them without the consent of one Maurice, governor of the castle. Having summoned, by proclamation, the inhabitants of Fife, Angus, Strathern, Stirlingshire, Lothian, Merse, and Teviotdale, to be ready to compear at Edinburgh on the 10th of December, with 40 days victuals, to assist in the siege; he sent three noblemen to borrow artillery from Maurice, and to remain as pledges for the safe redelivery of the same; and the several pieces required were accordingly sent him. This delicacy is the more remarkable, as we are told that the duke of Albany had given orders that every thing in his castle should be at the king's service. However unanimous the parliament might appear against the Douglasses, yet James was but ill-seconded in this attempt. The unfortunate, if severely proceeded against, generally find friends; and the enemies of the Douglasses had impolitically rendered it treasonable for any person to shelter or protect the earl of Angus, his kinsmen, or followers. This proceeding, in a country where the Douglasses had so many connexions, carried with it an appearance of cruelty and a thirst of revenge, especially as James had chosen such a season of the year for carrying on the siege. In short, after battering the place for some days, and losing one Falconer, his chief engineer, the king was obliged to abandon his enterprise, or rather to turn the siege into a blockade, with no great credit to his first essay in the field. Some historians intimate, that Angus found means to corrupt the other engineers; but we find, that before this time, a negotiation was going forward between James and the king of England; the nature of which proves that the former was now rendered more placable towards the Douglasses, and was the true reason why the siege was suspended.

The truce between Scotland and England was now near expiring; and Henry, under that pretence, gave a commission to the prior of Durham, Thomas Magnus, Sir Anthony Ughtred captain of the town and castle of Berwick, William Frankelyn chancellor of Durham, and Sir Thomas Tempest. James seems to have been in no haste to enter upon this negotiation, because he understood that the English commissioners were privately instructed to insist upon the Douglasses being restored to their estates and dignities. England was at that time the principal ally of Francis against the emperor; and this gave a handle for Francis to interpose so far in favour of the Douglasses, that he brought James to consent to a preliminary negotiation for their obtaining at least a secure retreat in England. This was at last complied with.

James being now delivered from all dread of the Douglasses, and under no controul from any party, showed excellent dispositions for government. Finding that the borderers were by no means pleased with the late treaty, and that they were renewing their depredations, he resolved to strike at the root of an evil which had so long proved disgraceful and dangerous to his ancestors, by giving no quarter to the chiefs of these robbers, whose principal residence was in Liddesdale. This was the more necessary, as their daring attempts had exasperated the English so much, that they had actually burnt a town in Teviotdale; and they had killed one Robert

Kerr,

land. Kerr, a man of some consequence. Two of the chiefs of the Scotch borderers were Cockburn of Kenderlaw, and Adam Scot, commonly called *king of the thieves*. Both of them were barons; and had been so inured to the practice, that they thought there was no crime in robbing: they therefore appeared publicly in Edinburgh; where James ordered them to be apprehended, tried, and hanged. He next proceeded with great firmness against many noblemen and principal gentlemen, who were only suspected of being disaffected to the late peace. All of them had behaved with great loyalty, and some of them had done him the most important services. Of this number were the earl of Hume, the lord Maxwell, with the barons of Buccleugh, Farniherst, Polwart, Johnston, and Mark Kerr. Though we know nothing particulerly of what was laid to the charge of those noblemen and gentlemen, yet so zealous was James for the impartial administration of justice, that he ordered them all, with many other chief gentlemen of the borders, to be sent to prison; where they lay till they entered into recognizances themselves, and found bail for their good behaviour.

Of all the party of the Douglasses, none of any note excepting Alexander Drummond of Carnock was suffered to return home, at the earnest request of the ambassadors and the treasurer Barton. This lenity was of very little consequence; for James having appointed the earl of Murray to be sole warden of the Scotch marches, with power to treat with the earl of Northumberland, their conferences had broken off on account of fresh violences happening every day; and some information he had received from them, had prevailed with James to imprison the noblemen and gentlemen we have already mentioned. He now resolved to attempt in person what his predecessors and he had so often failed in by their deputies. As he was known to be violently addicted to hunting, he summoned his nobility, even on the north of the Forth, to attend him with their horses and dogs; which they did in such numbers, that his hunting retinue consisted of above 8000 persons, two-thirds of whom were well armed. This preparation gave no suspicion to the borderers, as great hunting matches in those days commonly consisted of some thousands; and James having set out upon his diversion, is said to have killed 540 deer. Among the other gentlemen who had been summoned to attend him, was John Armstrong of Gilnockhall. He was the head of a numerous clan, who lived with great pomp and splendour upon the contributions under which they laid the English on the borders. He was himself always attended by twenty-six gentlemen on horseback, well mounted and armed, as his body guards. Having received the king's invitation, he was fond of displaying his magnificence to his sovereign; and attiring himself and his guard more pompously than usual, they presented themselves before James, from whom they expected some particular mark of distinction for their services against the English, and for the remarkable protection they had always given to their countrymen the Scots. On their first appearance, James, not knowing who he was, returned Armstrong's salute, imagining him to be some great nobleman; but upon hearing his name, he ordered him and his followers to be immediately apprehended, and sentenced them to be hanged upon the spot. It is said that James, turning to his attendants, asked them, pointing to Armstrong, "What does that knave want that a king should have, but a crown and a sword of honour?" Armstrong begged hard for his life; and offered to serve the king in the field with forty horsemen, besides making him large presents of jewels and money, with many other tempting offers. Finding the king inexorable, "Fool that I am (said he) to look for warm water under ice, by asking grace of a graceless face;" and then he and his followers submitted to their fate. Those and some other executions of the same kind restored peace to the borders.

Hitherto we have considered only the civil transactions of Scotland; but henceforth religion will claim a considerable share of the historian's attention. The opinions of Luther had been propagated in Britain soon after his preaching in 1517. They had for some years insensibly gained ground; and, at the time the contentions began between James and his nobility, were become formidable to the established religion. We have seen how James escaped from the bands of his nobles by means of the archbishop of St Andrew's. To the clergy, therefore, he was naturally favourable; and as they of necessity opposed the Reformation, James became a zealous persecutor of the reformed. On the other hand, the nobility having already opposed the king and clergy in civil affairs, did so likewise in those of religion. The clergy finding themselves unequal in argument, had recourse to more violent methods. Rigorous inquisitions were made after heretics, and fires were every where prepared for them.

43 Why ... favou... the cl...

44 Mart... dom ... trick ... milto...

The first person who was called upon to suffer for the reformed religion was Patrick Hamilton, abbot of Ferne. At an early period of life he had been appointed to this abbacy; and having imbibed a favourable idea of the doctrines of Luther, he had travelled into Germany, where, becoming acquainted with the most eminent reformers, he was fully confirmed in their opinions. Upon his return to Scotland, he ventured to expose the corruptions of the church, and to insist on the advantages of the tenets which he had embraced. A conduct so bold, and the avidity with which his discourses were received by the people, gave an alarm to the clergy. Under the pretence of a religious and friendly conference, he was seduced to St Andrew's by Alexander Campbell, a Dominican friar, who was instructed to remonstrate with him on the subject of the Reformation. The conversations they held only served to establish the abbot more firmly in his sentiments, and to inflame his zeal to propagate them. The archbishop of St Andrew's, the archbishop of Glasgow, and other dignitaries of the church, constituting a court, called him to appear before them.

The abbot neither lost his courage nor renounced his opinions. He was convicted accordingly of heretical pravity, delivered over to the secular arm, and executed in the year 1527 (N). This reformer had not attained the

(N) His tenets were of the following import, and are enumerated in the sentence pronounced against him. "Man

ind. the 24th year of his age. His youth, his virtue, his magnanimity, and his sufferings, all operated in his favour with the people. To Alexander Campbell, who insulted him at the stake, he objected his treachery, and cited him to answer for his behaviour before the judgement-seat of Christ. And this persecutor, a few days after, being seized with a frenzy, and dying in that condition, it was believed with the greater sincerity and confidence, that Mr Hamilton was an innocent man and a true martyr.

3 ge- ndig- A deed so affecting, from its novelty and in its circumstances, excited throughout the kingdom an universal curiosity and indignation. Minute and particular inquiries were made into the tenets of Mr Hamilton. Converts to the new opinions were multiplying in every quarter, and a partiality to them began to prevail even among the Romish clergy themselves. Alexander Seton, the king's confessor, took the liberty to inveigh against the errors and abuses of Popery; to neglect, in his discourses, all mention of purgatory, and pilgrimages, and saints; and to recommend the doctrines of the reformed. What he taught was impugned; and his boldness rising with contradiction, he defended warmly his opinions, and even ventured to affirm, that in Scotland there were no true and faithful bishops, if a judgement of men in this station is to be formed from the virtues which St Paul has required of them. A sarcasm so just, and so daring, inflamed the whole body of the prelacy with resentment. They studied to compass his destruction: and, as Mr Seton had given offence to the king, whom he had exhorted to a greater purity of life, they flattered themselves with the hope of conducting him to the stake; but, being apprehensive of danger, he made his escape into England.

4 For- rut; In 1533, Henry Forrest, a Benedictine friar, who discovered a propensity to the reformed doctrines, was not so fortunate. After having been imprisoned for some time in the tower of St Andrew's, he was brought to his trial, condemned, and led out to the flames. He had said, that Mr Hamilton was a pious man, and a martyr; and that the tenets for which he suffered might be vindicated. This guilt was aggravated by the discovery that Friar Forrest was in possession of a New Testament in the English language; for the priests esteemed a careful attention to the Scriptures to be an infallible symptom of heresy. A cruelty so repugnant to the common sense and feelings of mankind, while it pleased the insolent pride of the ecclesiastics, was destroying their importance, and exciting a general disposition in the people to adopt in the fullest latitude the principles and sentiments of the reformed.

The following year, James Beaton archbishop of St Andrew's, though remarkable for prudence and moderation, was overawed by his nephew and coadjutor David Beaton, and by the clergy. In his own person, or by commission granted by him, persecutions were carried on with violence. Many were driven into banishment, and many were forced to acknowledge what they did not believe. The more strenuous and resolute were delivered over to punishment. Among these were two private gentlemen, Norman Gourlay and David Straton. They were tried at Holyroodhouse before the bishop of Ross; and refusing to recant, were condemned. King James, who was present, appeared exceedingly solicitous that they should recant their opinions; and David Straton, upon being adjudged to the fire, having begged for his mercy, was about to receive it, when the priests proudly pronounced, that the grace of the sovereign could not be extended to a criminal whom their law and determination had doomed to suffer. 425 as also Gourlay and Straton;

426 With several others. A few years after, the bishops having assembled at Edinburgh, two Dominician friars, Killor and Beverage, with Sir Duncan Sympson a priest, Robert Forrester a gentleman of Stirling, and Thomas Forrest vicar of Doloor in Perthshire, were condemned to be consumed in the same fire.

At Glasgow, a similar scene was acted in 1539: Hieronymus Russel a gray-friar, and a young gentleman of the name of Kennedy, were accused of heresy before the bishop of that see. Russel, when brought to the stake, displayed a deliberate demeanour, reasoned gravely with his accusers, and was only answered with reproaches. Mr Kennedy, who was not yet 18 years of age, seemed disposed to disavow his opinions, and to sink under the weight of a cruel affliction; but the exhortation and example of Russel awakening his courage, his mind assumed a firmness and constancy, his countenance became cheerful, and he exclaimed with a joyful voice, "Now, I defy thee, Death; I praise my God, I am ready."

427 Promotion of Card. Beaton. James Beaton, the archbishop of St Andrew's, having died about this time, the ambition of David Beaton, his coadjutor, was gratified in the fullest manner. He had before been created a cardinal of the Roman church, and he was now advanced into the possession of the primacy of Scotland. No Scottish ecclesiastic had been ever invested with greater authority; and the reformers had every thing to fear from so formidable an enemy. The natural violence of his temper had fixed itself in an overbearing insolence, from the success which had attended him. His youth had been passed in scenes of policy and intrigue, which, while they communicated to him address and the knowledge of men, corrupted altogether the simplicity and candour of his mind. He was dark, designing, and artificial. No principles of justice were any bar to his schemes; nor did his heart open to any impressions of pity. His ruling passion was an inordinate love of power; and the support of his consequence depending alone upon the church of Rome, he was animated to maintain its superstitions with the warmest zeal. He seemed to take a delight in perfidiousness and dissimulation: he had no religion; and he was stained with an inhuman cruelty, and 428 His character.

"Man hath no free-will. Man is in sin so long as he liveth. Children, incontinent after their baptisme, are sinners. All Christians, that be worthie to be called Christians, do know that they are in grace. No man is justified by works, but by faith only. Good works make not a good man, but a good man doth make good works. And faith, hope, and charity, are so knit, that he that hath the one hath the rest; and he that wanteth the one of them wanteth the rest." *Keith, Hist. of the Church and State of Scotland, Appendix*, p. 3.

and the most open profligacy of manners. In connection with these defects, he possessed a persevering obstinacy in pursuing his measures, the ability to perceive and to practise all the arts which were necessary to advance them, and the allurements of ostentation and prodigality.

He was scarcely invested in the primacy, when he exhibited an example of his taste for magnificence, and of his aversion to the reformed. He proceeded to St Andrew's with an uncommon pomp and parade. The earls of Huntley, Arran, Marischal, and Montrose, with the lords Fleming, Lindsey, Erskine, and Seton, honoured him with their attendance; and there appeared in his train, Gavin archbishop of Glasgow and lord high chancellor, four bishops, six abbots, a great many private gentlemen, and a vast multitude of the inferior clergy. In the cathedral church of St Andrew's, from a throne erected by his command, he harangued concerning the state of religion and the church, to this company, and to a crowd of other auditors. He lamented the increase of heretics: he insisted upon their audacity and contempt of order; he said, that even in the court of the sovereign too much attention was shown to them; and he urged the strong necessity of acting against them with the greatest rigour. He informed this assembly, that he had cited Sir John Borthwick to appear before it, for maintaining tenets of faith hostile to the church, and for dispersing heretical books; and he desired that he might be assisted in bringing him to justice. The articles of accusation (o) were accordingly read against him; but he neither appeared in his own person, nor by any agent or deputy. He was found, notwithstanding, to be guilty; and the cardinal, with a solemnity calculated to strike with awe and terror, pronounced sentence against him. His goods and estate were confiscated; a painted representation of him was burned publicly, in testimony of the malediction of the church, and as a memorial of his obstinacy and condemnation. It was ordained, that in the event of his being apprehended, he should suffer as a heretic, without hope of grace or mercy. All Christians, whether men or women, and of whatever degree or condition, were prohibited from affording him any harbour or sustenance. It was declared, that every office of humanity, comfort, and solacement, extended to him, should be considered as criminal, and be punished with confiscations and forfeitures.

29 [John Borth]wick [att]ached.

Sir John Borthwick having been apprised of his danger, fled into England; where he was kindly received by Henry VIII. who employed him in negotiations with the Protestant princes of Germany. Cardinal Beatun perceived with concern that this act of severity did not terrify the people. New defections from the church were announced to him. Andrew Cunningham son to the master of Glencairn, James Hamilton brother to Patrick Hamilton the martyr, and the celebrated George Buchanan the historian, were imprisoned upon suspicions of heresy; and, if they had not found means to escape, must have died at the stake. In this declining condition of Popery, the cardinal held many mournful consultations with the bishops. All their intrigues and wisdom were employed to devise methods to support themselves. The project of an inquisitorial court was conceived, and exhibited a distant view of the extirpation of heretics. To erect this tribunal, they allured James V. with the hopes of the confiscations and spoils, which might enrich him, from the persecution and punishment of the reformed. He yielded himself to their solicitations, and gave them the sanction of his authority.

4[...] He fl[ies] to E[ng]land.

A formal commission was granted, constituting a court of inquiry after heretics, and nominating for its president Sir James Hamilton of Fennard, natural brother to the earl of Arran. The officious assiduity of this man, his ambition, and his thirst of blood, were acceptable in a high degree to the clergy; and to this bad eminence their recommendation had promoted him. Upon the slightest suspicion he was allowed to call any person before him, to scrutinize into his creed, and to absolve or to condemn him. A tribunal so dreadful could not have found a director more suited to it. He was in haste to fill the prisons of the kingdom with culprits, and was marking down in lists the names of all those to whom heresy was imputed by popular report, and whom the arts of malicious men had represented as the objects of correction and punishment. But, while he was brooding

4[...] Sir J[ames] Ham[ilton] appoi[nted] a kin[d of] inqui[sitor].

(o) They are preserved by Archbishop Spotiswood, and display great liberality of mind, in a period when philosophy may be said to have been unknown in Scotland. They are thus detailed by this judicious writer:—

1. "That he held the pope to have no greater authority over Christians than any other bishop or prelate had.
2. "That indulgences and pardons granted by the pope were of no force nor effect, but devised to abuse people, and deceive poor ignorant souls.
3. "That bishops, priests, and other clergymen, may lawfully marry.
4. "That the heresies, commonly called *heresies of England*, and their new liturgy, were commendable, and to be embraced of all Christians.
5. "That the people of Scotland are blinded by their clergy, and professed not the true faith.
6. "That churchmen ought not to enjoy temporalties.
7. "That the king ought to convert the rents of the church into other pious uses.
8. "That the church of Scotland ought to be governed after the manner of the English.
9. "That the canons and decrees of the church were of no force, as being contrary to the law of God.
10. "That the orders of the friars and monks should be abolished, as had been done in England.
11. "That he did openly call the pope *simoniac*, for that he sold spiritual things.
12. "That he did read heretical books, and the New Testament in English, and some other treatises written by Melancthon, Oecolampadius, and Erasmus, which he gave likewise unto others.
13. "The last and greatest point was, that he refused to acknowledge the authority of the Roman see, or be subject thereunto." *Hist. of the Church*, p. 70.

Scotland. ing over mischief, and multiplying in fancy the triumphs of his wickedness, an unexpected turn of affairs presented himself in the light of a criminal, and conducted him to the scaffold.

432 The brother of Mr Hamilton, the martyr, to avoid persecution, had been obliged to go into banishment; but, by the intercession of his friends, he was permitted to return for a short time to his own country, that he might regulate the affairs of his family. He was connected with Sir James Hamilton; and, trusting to the ties of blood, ventured to prolong his stay beyond the period allotted to him. This trespass was trivial. Sir James Hamilton, being willing to give a signal example of severity, and by this means to ingratiate himself the more with the priesthood, took the resolution to make his own relation the first victim of his power. Mr Hamilton, attentive to his personal security, and not unacquainted with the most private machinations of this inquisitor, despatched his son to the king, who was about to pass the Forth in a barge, and entreated him to provide for his safety, as Sir James Hamilton had conspired with the house of Douglas to assassinate him. James V. being at variance with the house of Douglas, had reasons of suspicion, and was disposed to believe every thing that is most flagitious of Sir James Hamilton. He instructed the young gentleman to go with expedition to Edinburgh, and to open the matter to the privy council; and that he might be treated with the greater respect, he furnished him with the ring which he was accustomed to send to them upon those important occasions which required their address and activity. Sir James Hamilton was apprehended and imprisoned. An accusation of having devised and attempted the king's death at different times, was preferred against him. His defence appeared to be weak and unsatisfactory. A jury, which consisted of men of rank and character, pronounced him guilty; and, being condemned to suffer the death of a traitor, he lost his head, and the quarters of his body were exposed upon the gates of the city of Edinburgh. The clergy, who could not prevent his trial and execution, regretted his death, but did not think of appointing a successor to him in their court of inquisition.

434 ...ndemn- ...and exe- ...d.

In other respects, however, James showed great concern for the welfare of his people. Being dissatisfied with the ordinary administration of justice, he had recourse to the parliament of Paris for a model of the like institution in Scotland. Great objections lay to juries in civil matters, and to ambulatory courts of justice.

435 The authority of the heritable jurisdictions was almost exclusive of all law; for though the king might preside in them, yet he seldom did; and appeals before the council were disagreeable and expensive. The institution of lords of the articles threw too much weight into their scale, as no business could be transacted in parliament but what they allowed of and prepared; and it was always in the power of the crown to direct them as the king pleased. The true source of the public grievances in matters of property, lay in the disregard shown to the excellent acts which had passed during the reigns of the three first James's, and which had not been sufficiently supported in the late reigns. The evil had gathered strength during the minority of James V.; and he resolved to establish a standing jury for all matters of law and equity (for, properly speaking, the court of session in Scotland is no other), with a president, who was to be the mouth of the assembly. On the 13th of May, this year, as we find by a curious manuscript in the British museum, the lords of the articles laid before the parliament the proposition for instituting this court, in the following words: "Item, anent (concerning) the second artickel concerning the order of justice; because our sovereign lord is maist desirous to have an permanent order of justice for the universal of all his liege; and therefore tendis to institute an college of cunning and wise men for doing and administration of justice in all civil actions: and therefore thinke to be chosen certain persons maist convenient and qualified yair (there), to the number of fifteen persons, half spiritual, half temporal, with an president."

...nes re- ...ates the ...rts of ...ice. — Orig... the ... of s...

In the year 1533, hostilities were recommenced with England; but after some slight incursions on both sides, a truce again took place. The most remarkable transactions of these years, however, next to the religious persecutions already mentioned, were the negotiations for the king's marriage. Indeed, there is scarce any monarch mentioned in history who seems to have had a greater variety of choices, or who was more difficult to be pleased. The situation of affairs on the continent of Europe, had rendered Scotland a kingdom of great consequence, as holding the balance between France, England, and the emperor of Germany; and each of the rival powers endeavoured to gain the favour of James, by giving him a wife.—In 1534, King Francis offered him his daughter; and the match was strongly recommended by the duke of Albany, who was still living in France, and served James with great fidelity. The same year the Imperial ambassador arrived in Scotland, and presented, in the name of his master, the order of the Golden Fleece to James, who had already been invested with that of St Michael by Francis. At the same time, he offered him his choice of three princesses; Mary of Austria, the emperor's sister, and widow of Lewis king of Hungary; Mary of Portugal, the daughter of his sister Eleonora of Austria; or Mary of England, the daughter of Catharine and Henry. Another condition, however, was annexed to this proposal, viz. that, to suppress the heresies of the time, a council should be held for obviating the calamities which threatened the Christian religion. Those proposals would have met with a more ready acceptance from James, had not his clergy, at this time, been disgusted with Charles, for allowing too great a latitude to the Protestants of Germany. James, in his answer, returned the emperor his acknowledgments in the most polite terms, for the splendid alliances he had offered him. He touched the proposal of the council as being a measure rather to be wished for than hoped, because it ought to be free and holy, and upon the model of the first councils; its members consisting of the most charitable, quiet, and disinterested part of the clergy. He said, that if such a council could be obtained, he would willingly send ecclesiastics to it; but if not, that every prince ought to reform the errors of doctrine, and the faults of the clergy, within his own dominions. He bewailed the obstinate conduct of his uncle in his divorce and marriage; and offered his best offices for effecting a reconciliation between him and the emperor, wishing

Neg... tio... the ... mar... — Ot... the ... ror ... man... — Wh... rej... Jam...

wishing that all the princes of Christendom would unite their arms against their common enemy the Turks. He hinted, very justly, that his Imperial majesty had offered more than he could perform, because his cousin, Mary of England, was not at his disposal. The ambassador replied, that his master, if persuasions failed, would compel Henry by force of arms to resign her. James answered this ridiculous declaration by observing, that the emperor then would be guilty of a breach of all laws both divine and human; that it would be impolitic to give a preference to any of the three princesses, all of them being so illustrious and deserving; but, to show how much he valued an alliance with his Imperial majesty, he would become a suppliant to that prince for his niece, daughter to Christiern king of Denmark, to become his bride. The ambassador's answer to this unexpected request was, that she was already betrothed to the count palatine, and that before that time the marriage was probably consummated.

But whether the Imperial ambassador had any right to offer the English princess or not, it is agreed by most historians, that he was offered either Mary or Elizabeth by their father Henry himself. To Mary of
40 marries ... Bourbon, the daughter of the duke of Vendosme, he is said to have been contracted; but for some reason or other all these matches were broken off; and the king at last went to France, where he married Magdalen the eldest daughter of Francis. The nuptials were celebrated at Paris in the year 1537, with great magnificence; and among other things served up by way of dessert at the marriage feast, were a number of covered cups filled with pieces of gold and gold dust, the native product of Scotland, which James distributed among the guests. This gold was found in the mines of Crawford-moor, which were then worked by the Germans. In the beginning of May, the royal pair embarked for Leith, under convoy of four large ships of war, and landed on the 28th of the same
41 ... dies ... after. month. The joy of the Scots was inexpressible, but it was of short continuance; for the young queen died of a fever on the 22d of July the same year.

King James did not long remain a widower; for the same year he sent Beaton abbot of Arbroath, to treat
42 ... of his second marriage with a French lady, Mary of Guise, duchess-dowager of Longueville. In this he was rivalled by his uncle Henry VIII. but not before James had been contracted to her. But this was nothing to Henry; for he not only insisted upon having this lady for his wife, but threw out some menaces against Francis, because he would not comply with this unjustifiable request. In January 1538, she was married to James, and escorted to Scotland by the admiral of France with a considerable squadron; both James and Francis being suspicious that Henry would make some attempt to intercept the royal bride. But nothing of this kind happened, and she landed safely at Fifeness; from whence she was conducted to the king at St Andrew's.

43 ... But while James appeared thus to be giving himself up to the pleasures of love, he was in other respects showing himself a bloody tyrant. Some differences subsisted between the families of Gordon and Forbes in the north. The heir of the house last mentioned had been educated in a loose dissipated manner, and kept company with a worthless fellow named *Strachan*. Having refused this favourite something he had asked, the latter attached himself to Gordon earl of Huntley, who, it is said, assisted him in forming a charge of treason against Forbes. He was accused of intending to restore the Douglasses to their forfeited estates and honours; which improbable story being supported by some venal evidences, the unhappy young man was condemned and executed as a traitor. The king could not but see the injustice of this execution; and, in order to make some amends for it, banished Strahan the kingdom. The following execution, which happened a few days after, was much more inhuman, insomuch that it would have stained the annals even of the most despotic tyrants. The earl of Angus, finding that he could not regain the favour of the king, had recourse to the method usual in those days, viz. the committing of depredations on the borders. This crime was sufficient with James to occasion the death of his innocent sister, the dowager-lady of Glamis. She had been courted by one Lyon, whom she had rejected in favour of a gentleman of the name of *Campbell*. Lyon, exasperated at his repulse, found means of admittance to James, whom he filled with the greatest terrors on account of the practices of the family of Angus; and at last charged the lady, her husband, and an old priest, with a design of poisoning the king in order to restore Angus. The parties were all remarkable for the quiet and innocent lives they led; and even this circumstance was by their diabolical accuser turned to their prejudice, by representing it as the effect of cunning or caution. In this reign an accusation of treason was always followed by condemnation. However, the evidence against the lady appeared so absurd and contradictory, that some of the judges were for dropping the prosecution, and others for recommending her case to the king; but the majority prevailed to have it determined by a jury, who brought her in guilty; and she was condemned to be burnt alive in the Castlehill of Edinburgh. The defence she made would have done honour to the ablest orator, and undeniably proved her innocence; but tho' it was reported to James, it was so far from mitigating her sentence, that it was aggravated by her husband being obliged to behold her execution. The unhappy husband himself endeavoured to make his way over the castle wall of Edinburgh; but the rope proving too short, he was dashed in pieces: and Lord Glamis her son, though but a child, was imprisoned during the remainder of this reign. The old priest, though put to the torture, confessed nothing, and was freed. Lyon, like the other accuser already mentioned, was banished the kingdom.

Whether these and other cruelties had affected the king's conscience, or whether his brain had been touched by the distractions of the different parties, is unknown: but it is certain, that, in the year 1540, he began to live retired: his palace appeared like the cloistered retreat of monks; his sleep was haunted by the most frightful dreams, which he construed into apparitions; and the body of Sir James Hamilton, whose execution has already been mentioned, seemed continually present to his eyes. Perhaps the loss of his two sons, who died on the same day that Sir James was executed, might have contributed to bring this man more remarkably

ably to his remembrance. No doubt, it added to the gloom of his mind; and he now saw his court abandoned by almost all his nobility.

At last James was in some degree roused from his inaction, by the preparations made against him by his uncle Henry VIII. of England. Some differences had already taken place; to accommodate which, Henry had desired a conference with James at York. But this the latter, by the advice of his parliament, had declined. The consequence was a rupture between the two courts, and the English had taken 20 of the Scots trading vessels. Henry threatened to revive the antiquated claim of the English superiority over Scotland, and had given orders for a formidable invasion of the Scotch borders. He complained that James had usurped his title of Defender of the Faith, to which he had added the word Christian, implying that Henry was an infidel: but the kings of Scotland had, some time before, been complimented by the papal see with that title. James, on the other hand, threw his eyes towards Ireland, the north part of which was actually peopled with inhabitants who owned no sovereign but the king of Scotland, and who offered to serve James against the English; some of their chiefs having actually repaired to Scotland, and done homage to James.

48 Henry had, about this time, declared himself king of Ireland, of which he was before only styled the *lord*; and James roundly asserted, that he had a preferable claim to at least one half of that island, which had been peopled by the subjects of Scotland. Though the Scotch historians of this reign take very little notice of this incident, yet James appears to have been very tenacious of his title; and that there was a vast intercourse carried on between the subjects of Scotland and the northern Irish, who unanimously acknowledged James for their natural sovereign. Indeed, this was the only ground of quarrel that the king, with the least shadow of justice, could allege against Henry.

49 His parliament being met, many public-spirited acts were passed; and before the assembly was dissolved, the members renewed the acts against leasing-making; by which is meant the misrepresenting of the king to his nobles, or the nobles to their king: and James, to dismiss them in good humour, passed an act of free grace for all crimes committed in his minority; the earl of Angus, and Sir George and Sir Archibald Douglas, being excepted.

Henry, after cutting off the head of his wife Catharine Howard, married and divorced the princess Anne of Cleves, and found himself either deserted or distrusted by all the princes on the continent, Protestant as well as Roman Catholic. James and his clergy relied greatly on this public odium incurred by Henry;

50 but the emperor having again quarrelled with Francis, left Henry, whose dominions they had threatened jointly to invade, at liberty to continue his preparations against the Scots. He first ordered his fleet, then the most formidable of any in the world to make fresh descents upon Scotland. At the same time, he appointed a very considerable army to rendezvous upon the borders, under the command of Sir Robert Bowes, one of his wardens, the earl of Angus, and his two brothers Sir George and Sir Archibald Douglas. James was every day expecting supplies of money, arms, and other necessaries from France; but these not arriving, he reassembled his parliament on the 14th of March; which gratified him in all his demands. Many excellent regulations were made for the internal government, peace, and security of the kingdom, and against the exportation of money instead of merchandise. Acts were passed for fortifying and embellishing the town of Edinburgh, and for better supplying the subjects with wine and all the other necessaries of life. The royal revenue was increased by many additional estates; and the last hand was put to one of the best plans for a national militia that perhaps ever appeared. As yet, excepting in the disappointment which Henry met with from his nephew in not meeting him at York, he had no grounds for commencing hostilities. But it is here proper to observe, that the queen-mother was then dead; and consequently the connexion between James and Henry was weakened. Whatever her private character might have been, she was certainly a happy instrument of preventing bloodshed between the two kingdoms. She was buried with royal honours at Perth.

45[illegible] Death of the queen-mother.

James, to all appearance, was at this time in a most desirable situation. His domain, by forfeitures and otherwise, far exceeded that of any of his predecessors. He could command the purses of his clergy; he had large sums of ready money in his exchequer; his forts were well stored and fortified; and he was now daily receiving remittances of money, arms, and ammunition from France. All this show of happiness was only in appearance; for the affections of his nobility, and the wiser part of his subjects, were now alienated from him more than ever, by the excessive attachment he showed to bigotry and persecution.

45[illegible] James [illegible] the affections of [illegible] subjects.

He had nominated the earl of Huntley to command his army on the borders, consisting of 10,000 men; and his lieutenant general was Sir Walter Lindsay of Torphichen, who had seen a great deal of foreign service, and was esteemed an excellent officer. Huntley acquitted himself admirably well in his commission; and was so well served by his spies, as to have certain intelligence that the English intended to surprise and burn Jedburgh and Kelso. The English army under Sir Robert Bowes and the Douglasses, with other northern Englishmen, continued still upon the borders; and one of the resolutions the Scotch nobility and gentry had come to, was, not to attack them on their own ground, nor to act offensively, unless their enemies invaded Scotland. Huntley being informed that the English had advanced, on the 24th of August, to a place called *Haldanrig*, and that they had destroyed great part of the Scotch and debateable lands, resolved to engage them: and the English were astonished, when at day-break, they saw the Scotch army drawn up in order of battle. Neither party could now retreat without fighting; and Torphichen, who led the van, consisting of 2000 of the best troops of Scotland, charged the English so furiously, that Huntley gained a complete and an easy victory. Above 200 of the English were killed, and 600 taken prisoners; among whom were their general Sir Robert Bowes, Sir William Mowbray, and about 60 of the most distinguished northern barons; the earl of Angus escaping by the swiftness of his horse. The loss of the Scots was inconsiderable.

4[illegible] The English defeated by the earl of Huntley.

In the meanwhile, the duke of Norfolk having raised

ſed a great army, had orders to march northwards, and to diſperſe a manifeſto, complaining of James for having diſappointed him of the interview at York, and reviving the ridiculous claim of his own and his anceſtors ſuperiority over the kingdom of Scotland. It was plain, from the words of this manifeſto, that Henry was ſtill placable towards James; and that he would eaſily have dropt that claim, if his nephew would have made any perſonal advances towards a reconciliation.

The condition of James was now deplorable. The few faithful counſellors he had about him, ſuch as Kirkaldy of Grange, who was then lord treaſurer, plainly

454 intimated, that he could have no dependence upon his nobles, as he was devoted to the clergy; and James ſometimes, in a fit of diſtraction, would draw his dagger upon the cardinal and other eccleſiaſtics when they came to him with freſh propoſitions of murder and proſcriptions, and drive them out of his preſence. But he had no conſtancy of mind; and he certainly put into his pocket a bloody ſcroll that had been brought him by his prieſts, beginning with the earl of Arran, the firſt ſubject of the kingdom. In one of his cooler moments, he appointed the lord Erſkine, and ſome others of his nobility, to make a freſh attempt to gain time; and Henry even condeſcended to order the duke of Norfolk (who was then advanced as far as York), the lord privy ſeal, the biſhop of Durham, and others, to treat with him. The conferences were ſhort and unſucceſsful. The duke bitterly complained, that the Scots fought only to amuſe him till the ſeaſon for action was over. In ſhort, he conſidered both them and

455 Learmouth, who was ordered to attend him, as ſo many ſpies, and treated them accordingly. It was the 21ſt of October before he entered the eaſt borders of Scotland. According to the Scotch hiſtorians, his army conſiſted of 40,000 men; but the Engliſh have fixed it at 20,000.

James affected to complain of this invaſion as being unprovoked; but he loſt no time in preparing to repel the danger. The ſituation of his nobility, who were preſſed by a foreign invaſion on the one hand, and domeſtic tyrants on the other, induced them to hold frequent conſultations; and in one of them, they reſolved to renew the ſcene that had been acted at Lawder

456 bridge under James III. by hanging all his grandſon's evil counſellors. The Scots hiſtorians ſay, that this reſolution was not executed, becauſe the nobility could not agree about the victims that were to be ſacrificed; and that the king, who was encamped with his army at Falla moor, having intelligence of their conſultation, removed haſtily to Edinburgh; from which he ſent orders for his army to advance, and give battle to the duke of Norfolk, who appears as yet not to have entered the Scotch borders. The anſwer of the nobility was, that they were determined not to attack the duke upon Engliſh ground; but that if he invaded Scotland, they knew their duty. The earl of Huntley, who commanded the van of the Scottiſh army, conſiſting of 10,000 men, was of the ſame opinion: but no ſooner did Norfolk paſs the Tweed, than he haraſſed the Engliſh army, cut off their foraging parties, and diſtreſſed them in ſuch a manner, that the duke agreed once more to a conference for peace; which was managed, on the part of the Scots, by the biſhop of Orkney and Sir James Learmouth; but nothing was concluded. The Engliſh general, finding it now impoſſible on many accounts to proſecute his invaſion, repaſſed the Tweed; and was haraſſed in his march by the earl of Huntley, who deſiſted from the purſuit the moment his enemies gained Engliſh ground.

James, whoſe army at this time amounted to above 30,000 men, continued ſtill at Edinburgh, from which he ſent frequent meſſages to order his nobility and generals to follow the duke of Norfolk into England; but theſe were diſregarded. James was flattered, that now he had it in his power to be revenged for all the indignities that had been offered by England to Scotland. In this he was encouraged by the French ambaſſador, and the high opinion he had of his own troops. About the beginning of November, he came to a reſolution of reaſſembling his army, which was diſbanded upon the duke of Norfolk's retreat. This project appeared ſo feaſible and ſo promiſing, that ſeveral of the nobility are ſaid to have fallen in with it, particularly the lord Maxwell, the earls of Arran, Caſſilis, and Glencairn, with the lords Fleming, Somerville, and Erſkine: others repreſented, but in vain, that the arms of Scotland had already gained ſufficient honour, by obliging the powerful army of the Engliſh, with their moſt experienced general at their head, to make a ſhameful retreat before a handful; that the force of Scotland was inferior to that of England; and that an honourable peace was ſtill practicable. It was ſaid, in reply to thoſe conſiderations, that the ſtate of the quarrel was now greatly altered; that Henry had in his manifeſto declared his intention to enſlave their country; that he treated the nobility as his vaſſals; that the duke of Norfolk had been guilty of burning the dwellings of the defenceleſs inhabitants, by laying above 20 villages and towns in aſhes; and that no Scotchman, who was not corrupted by Henry's gold, would oppoſe the king's will. The laſt, perhaps, was the chief argument that prevailed on the lord Maxwell, a nobleman of great honour and courage, to agree to carry the war into England by Solway, provided he was at the head of 10,000 men. It was at laſt agreed that the earl of Arran and the cardinal ſhould openly raiſe men, as if they intended to enter the eaſt marches, where they were to make only a feint, while the lord Maxwell was to make the real attempt upon the weſt. Private letters were everywhere circulated to raiſe the men who were to ſerve under the lord Maxwell; among whom were the earls of Caſſilis and Glencairn, the lords Fleming, Somerville, Erſkine, and many other perſons of great conſideration. James, who never was ſuſpected of want of courage, probably would have put himſelf at the head of this expedition, had he not been diſſuaded from it by his prieſts and minions, who reminded him of the conſultations at Falla moor, and the other treaſonable practices of the nobility. They added, that moſt of them being corrupted by the Engliſh gold, he could not be too much on his guard. He was at laſt perſuaded to repair to the caſtle of Lochmaben or Carlaverock, and there to wait the iſſue of the inroad.

It was probably at this place that James was prevailed on to come to the fatal reſolution of appointing one Oliver Sinclair, a ſon of the houſe of Roſlin, and a favourite minion at court, to command the army in chief; and his commiſſion was made out accordingly. On

On the 23d of November, the Scots began their march at midnight; and having passed the Esk, all the adjacent villages were seen in flames by the break of day. Sir Thomas Wharton, the English warden of those marches, the bastard Dacres, and Musgrave, hastily raised a few troops, the whole not exceeding 500 men, and drew them up upon an advantageous ground; when Sinclair, ordering the royal banner to be displayed, and being mounted on the shoulders of two tall men, produced and read his commission. It is impossible to imagine the consternation into which the Scots were thrown upon this occasion; and their leaders setting the example, the whole army declared (according to the Scotch authors), that they would rather surrender themselves prisoners to the English, than submit to be commanded by such a general. In an instant, all order in the Scotch army was broken down; horse and foot, soldiers and scullions, noblemen and peasants, were intermingled. It was easy for the English general to perceive this confusion, and perhaps to guess at its cause. A hundred of his light horse happened to advance: they met no resistance: the nobles were the first who surrendered themselves prisoners; and the rest of the English advancing, they obtained a bloodless victory; for even the women and the boys made prisoners of Scotch soldiers, and few or none were killed. The Lord Herbert relates the circumstances of this shameful affair with some immaterial differences; but agrees with the Scotch authorities upon the whole. He mentions, however, no more than 800 common soldiers having been made prisoners. The chief of the prisoners were the earls of Cassilis and Glencairn, the lords Maxwell, Fleming, Somerville, Oliphant, and Gray, with above 200 gentlemen besides.

James was then at Carlaverock, which is about 12 miles distant from the place of action, depressed in his spirits, and anxious about the event of the expedition, which is to this day called the *Raid of Solway moss*. When the news came to his ears, and that the earl of Arran and the cardinal were returned to Edinburgh, he was seized with an additional dejection of mind, which brought him to his grave. In such a situation every cruel action of his former life wounded his conscience; and he at last sunk into a sullen melancholy, which admitted of no consolation. From Carlaverock he removed to Falkland; and was sometimes heard to express himself as if he thought that the whole body of his nobility were in a conspiracy against his person and dignity. The presence of the few attendants who were admitted into his chamber, and who were the wicked instruments of his misconduct, seemed to aggravate his sufferings, and he either could not or would not take any sustenance. His death being now inevitable, Beaton approached his bedside with a paper, to which he is said to have directed the king's hand, pretending that it was his last will. On the 18th of December, while James was in this deplorable state, a messenger came from Linlithgow, with an account that the queen was brought to bed of a daughter; and the last words he was distinctly heard to say, were, "It will end as it began: the crown came by a woman, and it will go with one; many miseries approach this poor kingdom; King Henry will either master it by arms, or win it by marriage." He then turned his face to the wall, and in broken ejaculations pronounced the word *Solway moss*, and some faint expressions alluding to the disgrace he suffered. In this state he languished for some days; for it is certain he did not survive the 13th.

46[illegible] James V. was succeeded by his infant daughter Mary, whose birth we have already mentioned. James had taken no steps for the security of his kingdom, so that ambitious men had now another opportunity of throwing the public affairs into confusion. The situation of Scotland indeed at this time was very critical. Many of the nobility were prisoners in England, and those who remained at home were factious and turbulent. The nation was dispirited by an unsuccessful war. Commotions were daily excited on account of religion, and Henry VIII. had formed a design of adding Scotland to his other dominions. By a testamentary deed which Cardinal Beaton had forged in the name of his sovereign, he was appointed tutor to the queen and governor of the realm, and three of the principal nobility were named to act as his counsellors in the administration. The nobility and the people, however, calling in question the authenticity of this deed, which he could not establish, the cardinal was degraded from the dignity he had assumed; and the estates of the kingdom advanced into the regency James Hamilton, earl of Arran, whom they judged to be entitled to this distinction, as the second person of the kingdom, and the nearest heir, after Mary, to the crown.

The disgrace of Cardinal Beaton might have proved the destruction of his party, if the earl of Arran had been endowed with vigour of mind and ability. But his views were circumscribed; and he did not compensate for this defect by any firmness of purpose. He was too indolent to gain partisans, and too irresolute to fix them. Slight difficulties filled him with embarrassment, and great ones overpowered him. His enemies applying themselves to the timidity of his disposition, betrayed him into weaknesses; and the esteem which his gentleness had procured him in private life, was lost in the contempt attending his public conduct, which was feeble, fluctuating, and inconsistent.

The attachment which the regent was known to profess for the reformed religion, drew to him the love of the people; his high birth, and the mildness of his virtues, conciliated their respect; and from the circumstance, that his name was at the head of the roll of heretics which the clergy had presented to the late king, a sentiment of tenderness was mingled with his popularity. His conduct corresponded at first, with the impressions entertained in his favour. Thomas Guillaume and John Rough, two celebrated preachers, were invited to live in his house; and he permitted them to declaim openly against the errors of the church of Rome. They attacked and exposed the supremacy of the pope, the worship of images, and the invocation of saints. Cardinal Beaton and the prelates were exceedingly provoked, and indefatigably active to defend the established doctrines.

This public sanction afforded to the Reformation was of little consequence, however, when compared with a measure which was soon after adopted by Robert Lord Maxwell. He proposed, that the liberty of reading the scriptures in the vulgar tongue should be permitted to the people; and that, for the future, no heretical guilt should

should be inferred against any person for having them in his possession, or for making use of them. The regent and the three estates acknowledged the propriety of this proposal. Gavin Dunbar archbishop of Glasgow, and chancellor of Scotland, protested, indeed, for himself and for the church, that no act on this subject should pass and be effectual, till a provincial council of all the clergy of the kingdom should consider and determine, whether there was a necessity that the people should consult and study the Scriptures in the vulgar tongue. But his protestation being disregarded, the bill of the lord Maxwell was carried into a law, and the regent made it generally known by a proclamation.

From this period copies of the Bible were imported in great numbers from England; and men, allured by an appeal so flattering to their reason, were proud to recover from the supine ignorance in which they had been kept by an artful priesthood. To read became a common accomplishment: and books were multiplied in every quarter, which disclosed the pride, the tyranny, and the absurdities of the Romish church and superstitions.

69
The death of James V. proved very favourable to the ambitious designs of Henry. He now proposed an union of the two kingdoms by the marriage of his son Edward VI. with Mary the young queen of Scotland. To promote this, he released the noblemen who had been taken prisoners at Solway, after having engaged them on oath, not only to concur in promoting the alliance, but to endeavour to procure him the charge and custody of the young queen, with the government of her kingdom, and the possession of her castles. The earl of Angus and his brother, who had been fifteen years in exile, accompanied them to Scotland, and brought letters from Henry recommending them to the restitution of their honours and estates. The regent was inclined to favour the demands of persons of such eminent station; but though the states were inclined to the marriage, they refused to permit the removal of the queen into England, and treated with contempt the idea of giving the government of Scotland and the care of the castles to the king of England. Sir Ralph Sadler, the English ambassador, exerted all his endeavours to induce the regent to comply with the requisitions of his master; but all his intrigues were unsuccessful; and
70
Henry perceiving that he must depart from such extravagant conditions, at last authorized the commissioners to consent to treaties of amity and marriage, on the most favourable terms that could be procured. In consequence of these powers given to the commissioners, it was agreed that a firm peace and alliance should take place between the two nations, and that they should mutually defend and protect one another in case of an invasion. The queen was to remain within her own dominions till she was ten years of age; and Henry was not to claim any share in the government. Six nobles, or their apparent heirs, were to be surrendered to him in security for the conveyance of the young queen into England, and for her marriage with Prince Edward, as soon as she was ten years of age. It was also stipulated, that though the queen should have issue by Edward, Scotland should retain not only its name, but its laws and liberties.

471
These conditions, however advantageous to Scotland, yet did not give entire satisfaction. Cardinal Beaton, who had been imprisoned on pretence of treasonable schemes, and was now released from his confinement by the influence of the queen-dowager, took all opportunities of exclaiming against the alliance, as tending to destroy the independency of the kingdom. He pointed out to the churchmen the dangers which arose from the prevalence of heresy, and urged them to unanimity and zeal. Awakening all their fears and selfishness, they granted him a large sum of money with which he might gain partizans; the friars were instructed to preach against the treaties with England; and fanatical men were instructed to display their rage in offering indignities to Sir Ralph Sadler.

Cardinal Beaton was not the only antagonist the regent had to deal with. The earls of Argyll, Huntley, Bothwel, and Murray, concurred in the opposition; and having collected some troops, and possessed themselves of the queen's person, they assumed all the authority. They were joined by the earl of Lenox, who was made to hope that he might espouse the queen-dowager and obtain the regency. He was also inclined to oppose the earl of Arran, from an ancient quarrel which had subsisted between their two families; and from a claim he had to supersede him, not only in the enjoyment of his personal estates, but in the succession to the crown. The regent, alarmed at such a powerful combination against him, inclined to attend to some advances which were made him by the queen-dowager and cardinal. To refuse to confirm the treaties, after he had brought them to a conclusion, was, however, a step so repugnant to probity, that he could not be prevailed upon to adopt it. He therefore, in a solemn manner, ratified them in the abbey church of Holyroodhouse, and commanded the great seal of Scotland to be appended to them. The same day he went to St Andrew's, and issued a mandate to the cardinal, requiring him to return to his allegiance. To this the prelate refused to pay any attention, or to move from his castle; upon which the regent denounced him a rebel, and threatened to compel him to submission by military force. But in a few days after, the pusillanimous regent meeting with Beaton, forsook the interest of Henry VIII. and embraced that of the queen-dowager and of France. Being in haste also to reconcile himself to the church of Rome, he renounced publicly, at Stirling, the opinions of the reformed, and received absolution from the hands of the cardinal.

By this mean-spirited conduct the regent exposed himself to universal contempt, while Cardinal Beaton usurped the whole authority. The earl of Lenox, finding that he had no hopes of success in his suit to the queen-dowager, engaged in negotiations with Henry, to place himself at the head of the Scottish lords who were in the English interest, and to assert the cause of the Reformation. The consequence of all this was a rupture with England. Henry not only delayed to ratify the treaties on his part, but ordered all the Scottish ships in the harbours of England to be taken and confiscated. This violent proceeding inflamed the national disgusts against the English alliance; and the party of the cardinal and queen-dowager thus obtained an increase of popularity. Henry himself, however, was so much accustomed to acts of outrage and violence, that he seemed to think the step he had just now taken a matter of no moment; and therefore he demanded

manded that the hostages, in terms of the treaty of marriage, should still be delivered up to him. But the cardinal and regent informed his ambassador, Sir Ralph Sadler, that from their own authority they could not command any of the nobles to be committed to him as hostages; and that the offensive strain of behaviour assumed by the English monarch might have altered the sentiments of the Scottish parliament with regard to a measure of such importance. After much altercation, the conferences were broken off; and as the lords who were released from captivity had promised to return prisoners to England, it now remained with them to fulfil their promise. None of them, however, had the courage to do so, excepting the earl of Cassilis; and Henry, being struck with his punctilious sense of honour, dismissed him loaded with presents.

Cardinal Beaton being thus in possession of power, took measures to secure it. The solemnity of the coronation of the young queen was celebrated at Stirling. A council was chosen to direct and assist the regent in the greater affairs of state, at the head of which was the queen-dowager. John Hamilton, the abbot of Paisley, who had acquired an ascendency over the regent, was also promoted to the privy seal, and made treasurer of the kingdom; and Cardinal Beaton, upon the request of the regent and the three estates, accepted the office of the lord high chancellor.

After the flatteries and the hopes with which the earl of Lenox had been amused, the cardinal had reason to dread the utmost warmth of his resentment. He had therefore written to Francis I. giving a detail of the critical situation of affairs in Scotland, and entreating him to recal to France the earl of Lenox, who was now interested to oppose the influence and operations of the queen-dowager. But the indignation with which the treachery of the cardinal had inflamed the earl of Lenox, precipitated him into immediate action, and defeated the intention of this artifice. In the hostile situation of his mind towards Scotland, an opportunity of commencing hostility had presented itself. Five ships had arrived in the Clyde from France, loaded with warlike stores, and having on board the patriarch of Venice, Peter Contareni, legate from Paul III. with La Brosse, and James Mesnaige, ambassadors from France; and 30,000 crowns, which were to be employed in strengthening the French faction, and to be distributed by the queen-dowager and the cardinal. Prevailing with the commanders of these vessels, who conceived him to be the fast friend of their monarch, he secured this money for his own use, and deposited the military stores in his castle of Dumbarton, under the care of George Stirling the deputy-governor, who at this time was entirely in his interests.

By the successful application of this wealth, the earl of Lenox called forth the full exertion of his party in levying a formidable army, with which he threatened the destruction of the regent and the cardinal, offering them battle in the fields between Leith and Edinburgh. The regent, not being in a condition to accept the challenge of his rival, had recourse to negotiation. Cardinal Beaton and the earl of Huntley proposed terms of amity, and exerted themselves with so much address, that the earl of Lenox, losing the opportunity of chastising his enemies, consented to an accommodation, and indulged anew the hope of obtaining the queen-dowager in marriage. His army was dismissed, and he threw himself at the feet of his mistress, by whom he was, in appearance, favourably received; but many of his friends were seduced from him under different pretences; and at last, apprehending his total ruin from some secret enterprise, he fled to Glasgow, and fortified himself in that city. The regent, collecting an army, 481
marched against him; and having defeated his friend the earl of Glencairn in a bloody encounter, was able to reduce the place of strength in which he confided. In this ebb of his fortune, the earl of Lenox had no hope but from England.

And is obliged to fly.

The revolution produced in the political state of Scotland by the arts of Cardinal Beaton, while it defeated the intrigues of Henry VIII. pointed all its strength against the progress of the Reformation. After abandoning his old friends, the regent, in connection with the cardinal, was ambitious to undo all the services he had rendered to them. The three estates 482
annulled the treaties of amity and marriage, and empowered commissioners to conclude an alliance with France. The regent discharged the two preachers Guillaume and Rough, whom he had invited to impugn the doctrines of the church. He drove back into England many pious persons, whose zeal had brought them to Scotland, to explain and advance the new opinions. He caressed with particular respect the legate whom the pope had sent to discourage the marriage of the young queen with the prince of Wales, and to promise his assistance against the enterprises of Henry VIII. He procured an act of parliament to be passed for the persecution of heretics; and, upon the foundation of this authority, the most rigorous proceedings were concerted against the reformed; when the arms of England, rousing the apprehensions of the nation, gave the fullest employment to the regent and his counsellors.

Alliance with Fr[ance] conclud[ed,] and the Protesta[nts] persecut[ed.]

483
In the rage and anguish of disappointed ambition, the earl of Lenox made an offer to assist the views of the king of England; who, treating him as an ally, engaged, in the event of success, to give him in marriage his niece the lady Margaret Douglas, and to invest him in the regency of Scotland. To establish the Reformation in Scotland, to acquire the superiority over it to Henry VIII. and to effectuate the marriage of the prince of Wales with the queen of Scots, were the great objects of their confederacy.

Lenox [en]gages in the Eng[lish] interest.

484
Henry, though engaged in a war with France, which required all his military force, could not resist the earliest opportunity in his power to execute his vengeance against Scotland. Edward Seymour earl of Hartford was appointed to command 10,000 men; who were embarked at Tinmouth, aboard a fleet of 200 ships, under the direction of Sir John Dudley Lord Lisle. This army was landed without opposition near Leith; and the earl of Hartford made it known to Sir Adam Otterburn, the provost of Edinburgh, that his commission empowered him to lay the country waste and desolate, unless the regent should deliver up the young queen to the king of England. It was answered, that every extremity of distress would be endured, before the Scot- 485
tish nation would submit to so ignominious a demand. Six thousand horse from Berwick, under the lord Evers, now joined the earl of Hartford. Leith and Edinburgh, after a feeble resistance, yielded to the English commander; who abandoned them to pillage, and

An Eng[lish] army en[ters] Sco[t]land,

who com[mit] cru[el] devasta[tions, a]nd then sud[denly re]tire.

land. and then ſet fire to them. A cruel devaſtation enſued in the ſurrounding villages and country; and an immenſe booty was conveyed on board the Engliſh fleet. But, while an extreme terror was every where excited, the earl of Hartford re-embarked a part of his troops, and ordered the remainder to march with expedition to the frontiers of England.

The regent, aſſiſted by Cardinal Beaton and the earls of Huntley, Argyll, Bothwel, and Murray, was active in the mean time, to collect an army, and to provide for the ſecurity of the kingdom. He felt, therefore, the greateſt ſurpriſe on being relieved ſo unexpectedly from the moſt imminent danger; and an expedition, conducted with ſo little diſcernment, did not advance the meaſures of Henry VIII. To accompliſh the marriage of the young queen with the prince of Wales, to poſſeſs himſelf of her perſon, or to achieve a conqueſt over Scotland, were all circumſtances apparently within the reach of the Engliſh commander: and yet, in the moment of victory, he neglected to proſecute his advantages; and having inflamed the animoſities of the Scottiſh nation, by a diſplay of the paſſions and cruelty of his maſter, left them to recover from their diſaſter, and to improve in their reſources.

486 ...ccess ...e earl ...enox.

The earl of Lenox, taking the opportunity of the Engliſh fleet, went to conſult with Henry VIII. upon the deſperate ſtate of his affairs. He renewed his engagements with this monarch; and received in marriage the lady Margaret Douglas, with poſſeſſions in England. Soon after, he arrived in the frith of Clyde, with 18 ſhips and 600 ſoldiers, that he might ſecure the caſtle of Dumbarton, and employ himſelf in plundering and devaſtation. But George Stirling, to whom the caſtle was intruſted, refuſed to ſurrender it; and even obliged him to re-embark his troops. After engaging in a few petty incurſions and ſkirmiſhes, he returned to England.

487 ...uce ...luded ...Eng-

In 1544, Henry conſented to a truce; and Scotland, after having ſuffered the miſeries of war, was ſubjected to the horrors of perſecution. The regent had procured an act of parliament for the perſecution of the reformed; and the cardinal, to draw to himſelf an additional ſplendour and power, had obtained from the pope the dignity of legate *à latere*. A viſitation of his own dioceſe appeared to him the moſt proper method of commencing the propoſed extirpation of hereſy; and he carried with him in his train the regent, and many perſons of diſtinction, to aſſiſt in his judicatories, and to ſhare in his diſgrace.

488 ...ny cruel ...utions ...ccount ...eli- ...

In the town of Perth a great many perſons were accuſed and condemned. The moſt trifling offences were regarded as atrocious crimes, and made the ſubjects of proſecution and puniſhment. Robert Lamb was hanged for affirming that the invocation of ſaints had no merit to ſave. William Anderſon, James Reynold, and James Finlayſon, ſuffered the ſame death, for having abuſed an image of St Francis, by putting horns upon his head. James Hunter, having kept their company, was found to be equally guilty, and puniſhed in the ſame manner. Helen Strike, having refuſed, when in labour, to invoke the aſſiſtance of the Virgin, was drowned in a pool of water. Many of the burgeſſes of Perth, being ſuſpected of hereſy, were ſent into baniſhment; and the Lord Ruthven, the provoſt, was upon the ſame account diſmiſſed from his office.

The cardinal was ſtrenuous in perſecuting hereſy in other parts of his dioceſe. But the diſcontents and clamour attending the executions of men of inferior ſtation were now loſt in the fame of the martyrdom of George Wiſhart; a perſon who, while he was reſpect- Acco... able by his birth, was highly eminent from the opi- Mr G... nion entertained of his capacity and endowments. The Wiſh... hiſtorians of the Proteſtant perſuaſion have ſpoken of this reformer in terms of the higheſt admiration. They extol his learning as extenſive, inſiſt on the extreme candour of his diſpoſition, and aſcribe to him the utmoſt purity of morals. But while the ſtrain of their panegyric is expoſed to ſuſpicion from its exceſs, they have ventured to impute to him the ſpirit of prophecy; ſo that we muſt neceſſarily receive their eulogiums with ſome abatement. It may be ſufficient to affirm, that Mr Wiſhart was the moſt eminent preacher who had hitherto appeared in Scotland. His mind was certainly cultivated by reflection and ſtudy, and he was amply poſſeſſed of thoſe abilities and qualifications which awaken and agitate the paſſions of the people. His miniſtry had been attended with the moſt flattering ſucceſs; and his courage to encounter danger grew with his reputation. The day before he was apprehended, he ſaid to John Knox, who attended him; "I am weary of the world, ſince I perceive that men are weary of God." He had already reconciled himſelf to that terrible death which awaited him. He was found in the houſe of Cockburn of Ormiſton, in Eaſt Lothian; who refuſing to deliver him to the ſervants of the regent, the earl of Bothwel, the ſheriff of the county, required that he ſhould be intruſted to his care, and promiſed that no injury ſhould be done to him. But the authority of the regent and his counſellors obliged the earl to ſurrender his charge. He was conveyed to the cardinal's caſtle at St Andrew's, and his trial was hurried on with precipitation. The cardinal and the clergy proceeding in it without the concurrence of the ſecular power, adjudged him to be burnt alive. In the circumſtances of his execution there appears a deliberate and moſt barbarous cruelty. When led out to the ſtake, he was met by prieſts, who, mocking his condition, called upon him to pray to the Virgin, that ſhe might intercede with her Son for mercy to him. "Forbear to tempt me, my brethren," was his mild reply to them. A black coat of linen was put upon him by one executioner, and bags of powder were faſtened to his body by another. Some pieces of ordnance were pointed to the place of execution. He ſpoke to the ſpectators, entreating them to remember that he was to die for the true goſpel of Chriſt. Fire was communicated to the faggots. From a balcony in a tower of his caſtle, which was hung with tapeſtry, the cardinal and the prelates, reclining upon rich cuſhions, beheld the inhuman ſcene. This inſolent triumph, more than all his afflictions, affected the magnanimity of the ſufferer. He exclaimed, that the enemy, who ſo proudly ſolaced himſelf, would periſh in a few days, and be expoſed ignominiouſly in the place which he now occupied.

Cardinal Beaton took a pleaſure in receiving the congratulations of the clergy upon a deed, which, it was thought, would fill the enemies of the church with terror. But the indignation of the people was more excited than their fears. All ranks of men were diſguſted.

gusted with an exercise of power which despised every boundary of moderation and justice. The prediction of Mr Wishart, suggested by the general odium which attended the cardinal, was considered by the disciples of this martyr as the effusion of a prophet; and perhaps gave occasion to the assassination that followed. Their complaints were attended to by Norman Lesly, the eldest son of the earl of Rothes, whom the cardinal had treated with indignity, though he had profited by his services. He consented to be their leader. The cardinal was in his castle at St Andrew's, which he was fortifying after the strongest fashion of that age. The conspirators, at different times, early in the morning, entered into it. The gates were secured; and appointing a guard, that no intimation of their proceedings might go to the cardinal, they dismissed from the castle all his workmen separately, to the number of 100, and all his domestics, who amounted to no fewer than 50 persons. The eldest son of the earl of Arran, whom he kept as an hostage for his father's behaviour, was alone detained by them. The prelate, alarmed with their noise, looked from his window, and was informed that his castle was taken by Norman Lesly. It was in vain that he endeavoured to secure the door of his chamber by bolts and chests. The conspirators brought fire, and were ready to apply it, when, admitting them into his presence, he implored their mercy. Two of them struck him hastily with their swords. But James Melvil, rebuking their passion, told them, that this work and judgment of God, though secret, ought to be done with gravity. He reminded the cardinal, in general terms, of the enormity of his sins, and reproached him in a more particular manner with the death of Mr Wishart. He swore, that no hopes of his riches, no dread of his power, and no hatred to his person, were any motives which actuated him; but that he was moved to accomplish his destruction, by the obstinacy and zeal manifested by him against Christ Jesus and his holy gospel. Waiting for no answer to his harangue, he thrust the cardinal three times through the body with his dagger, on the 29th of May 1546.

The rumour that the castle was taken giving an alarm to the inhabitants of St Andrew's, they came in crowds to gratify their curiosity, and to offer their assistance, according to the sentiments they entertained. The adherents and dependents of the cardinal were clamorous to see him; and the conspirators, carrying his dead body to the very place from which he had beheld the sufferings of Mr Wishart, exposed it to their view.

491

The truce, in the mean time, which had been concluded with England was frequently interrupted; but no memorable battles were fought. Mutual depredations kept alive the hostile spirit of the two kingdoms; and while the regent was making military preparations, which gave the promise of important events, a treaty of peace was finished between England and France, in which Francis I. took care to comprehend the Scottish nation. In this treaty it was stipulated by Henry, that he was not to wage war against Scotland, unless he should be provoked by new and just causes of hostility.

But the murderers of Cardinal Beaton, apprehensive of their safety, had despatched messengers into England, with applications to Henry for assistance; and being joined by more than 120 of their friends, they took the resolution of keeping the castle, and of defending themselves. Henry, notwithstanding his treaty with France, resolved to embrace this opportunity of augmenting the disturbances of Scotland. He hastened to collect troops; and the regent and his counsellors pressed France for supplies in men and money, and military stores and artillery.

492 Proceedings against the murderers of the cardinal.

The high places which the cardinal occupied were filled up immediately upon his death. John Hamilton abbot of Paisley was elected archbishop of St Andrew's, and George earl of Huntley was promoted to be chancellor. By these officers the regent was urged to proceed with vigour against the conspirators; and it was a matter of the greatest anxiety to him to recover his eldest son, whom they detained in custody. The clergy had, in the most solemn manner, pronounced them to be accursed; and agreed to furnish, for four months, a monthly subsidy of 3000l. to defray the expence of reducing them to obedience. The queen-dowager and the French faction were eager, at the same time, to concur in avenging the assassination of a man to whose counsels and services they were so greatly indebted.—And that no dangerous use might be made of the eldest son of the earl of Arran, who, after his father, was the heir of the monarchy, an act of parliament was passed, excluding him from his birthright while he remained in the possession of the enemies of his country, and substituting his brothers in his place, according to their seniority. The dark politics of Henry suggested the necessity of this expedient; and in its meaning and tendency there may be remarked the spirit and greatness of a free people.

493 Castle of St Andrew's besieged.

A powerful army laid siege to the castle of St Andrew's, and continued their operations during four months; but no success attended the assailants. The fortifications were strong; and a communication with the besieged was open by sea to the king of England, who supplied them with arms and provisions. The garrison received his pay, and the principal conspirators had pensions from him. In return for his generosity, they were engaged to promote the marriage of his son with the young queen; to advance the Reformation: and to keep in custody the eldest son of the regent. Negotiation succeeded to hostility; and as the regent expected assistance from France, and the conspirators had the prospect of support from an English army, both parties were disposed to gain time. A treaty was entered into and transacted, in which the regent engaged to procure from Rome an absolution to the conspirators, and to obtain to them from the three estates an exemption from prosecutions of every kind. Upon the part of the besieged, it was stipulated, that when these conditions were fulfilled, the castle should be surrendered, and the regent's son delivered up to him. In the mean-time Henry VIII. died; and a few weeks after Francis I. also paid his debt to nature. But the former, before his death, had recommended the prosecution of the Scottish war; and Henry II. the successor of Francis, was eager to show his attention to the ancient ally of his nation. When the absolution arrived from Rome, the conspirators refused to consider it as valid; and an expression used by the pope, implying an absurdity, furnished an apology for their conduct. They knew that the counsellors of Edward VI. were making vigorous preparations to invade Scotland; they were confident of their present ability to defend themselves, and the advocates

494 Death of Henry VIII. and Francis.

advocates for the Reformation encouraged them with hopes and with flattery.

The favourers of the Reformation, in the mean time, adopting the intolerant maxims of the Roman Catholics, were highly pleased with the assassination of Beaton; and many of them congratulated the conspirators upon what they called their godly deed and enterprise. John Rough, who had formerly been chaplain to the regent, entered the castle and joined them. At this time also John Knox began to distinguish himself in an eminent manner, both by his success in argument and the unbounded freedom of his discourse; while the Roman clergy, everywhere defeated and ashamed, implored the assistance of the regent and his council, who assured them that the laws against heretics should be put in execution.

495 n Knox gins to inguish self.

496 tle of An- w's ta-

In the mean time the castle of St Andrew's being invested by a fleet of 16 sail under Admiral Strozzi from France, was obliged to capitulate. Honourable conditions were granted to the conspirators; but after being conveyed to France, they were cruelly used, from the hatred entertained by the Catholics against the Protestants. Many were confined in prisons; and others, among whom, says Dr Stuart, was John Knox, were sent to the galleys. The castle itself was razed to the ground.

497 tland aded by Eng-

The same year, 1547, Scotland was invaded by an English army under the duke of Somerset, who had been chosen protector of England during the minority of Edward VI. The design of this invasion was to oblige the Scots to comply with the scheme of Henry VIII. and conclude a marriage between Edward and the young queen of Scotland. The English army consisted of 18,000 men; besides which the protector had a fleet of 60 sail, one half of which were ships of war, and the others consisted of vessels laden with provisions and military stores. On the other hand, the regent opposed him with an army of 40,000 men. Before the commencement of hostilities, however, the duke of Somerset addressed a letter or manifesto to the government, in which he pressed the marriage with such powerful arguments, and so clearly showed the benefits which would result from it to both nations, that the regent and his party, who were averse to peace, thought proper to suppress it, and to circulate a report that the English had come to force away the queen, and to reduce the kingdom to a state of dependence. All hopes of an accommodation being thus removed, the English army advanced in order to give battle to the Scots. They found the latter posted in the most advantageous situation, around the villages of Musselburgh, Inveresk, and Monckton; so that he could not force them to an action, at the same time that he found himself in danger of having his communication with his ships cut off, which would have totally deprived his army of the means of subsistence. In this dangerous situation he had again recourse to negotiation, and offered terms still more favourable than before. He now declared himself ready to retire into England, and to make ample compensation for the injuries committed by his army, if the Scottish government would promise that the queen should not be contracted to a foreign prince, but should be kept at home till she was of age to choose a husband for herself, with the consent of the nobility. These concessions increased the confidence of the regent so much, that without taking advantage of the strength of his situation, he resolved to come to a general engagement.—The protector moved towards Pinkey, a gentleman's house to the eastward of Musselburgh; and the regent conceiving that he meant to take refuge in his fleet, changed the strong ground in which he was encamped. He commanded his army to pass the river Esk, and to approach the English forces, which were posted on the middle of Faside hill. The earl of Angus led on the van; the main body of the battle marched under the regent; and the earl of Huntley commanded in the rear. It was the regent's intention to seize the top of the hill. The Lord Gray, to defeat this purpose charged the earl of Angus, at the head of the English cavalry. They were received upon the points of the Scottish spears, which were longer than the lances of the English horsemen, and put to flight. The earl of Warwick, more successful with his command of infantry, advanced to the attack. The ordnance from the fleet assisted his operations; and a brisk fire from the English artillery, which was planted on a rising ground served still more to intimidate the Scottish soldiery.—The remaining troops under the protector were moving slowly, and in the best order, to take a share in the engagement. The earl of Angus was not well supported by the regent and the earl of Huntley. A panic spread itself through the Scottish army. It fled in different ways, presenting a scene of the greatest havock and confusion. Few perished in the fight; but the chase continuing in one direction to Edinburgh, and in another to Dalkeith, with the utmost fury, a prodigious slaughter was made. The loss of the conquerors did not amount to 500 men; but 10,000 soldiers perished on the side of the vanquished. A multitude of prisoners were taken; and among these the earl of Huntley, the lord high chancellor.

Batt Pink

The defe with slau

Amidst the consternation of this decisive victory, the duke of Somerset had a full opportunity of effectuating the marriage and union projected by Henry VIII. and on the subject of which such fond auxiety was entertained by the English nation. But the cabals of his enemies threatening his destruction at home, he yielded to the necessities of his private ambition, and marched back into England. He took precautions, however, to secure an entry into Scotland, both by sea and land. A garrison of 200 men was placed in the isle of St Columba in the Forth, and two ships of war were left as a guard to it. A garrison was also stationed in the castle of Broughty, which was situated in the mouth of the Tay. When he passed through the Merse and Teviotdale, the leading men of these counties repaired to him; and taking an oath of allegiance to King Edward, surrendered their places of strength. Some of these he demolished, and to others he added new fortifications. Hume castle was garrisoned with 200 men, and intrusted to Sir Edward Dudley; and he posted 300 soldiers, with 200 pioneers, in the castle of Roxburgh, under the command of Sir Ralph Bulmer.

The of S set r to E

The only resource of the regent now was the hope of assistance from France. The young queen was lodged in the castle of Dumbarton, under the care of the lords Erskine and Livingstone; and ambassadors were sent to Henry II. of France, acquainting him with the disaster of Pinkey, and imploring his assistance. The regent had

Scotland.

501 Further excesses of the English. had asked permission from the protector to treat of peace, and the earl of Warwick was appointed to wait for them at Berwick; but none were ever sent on the part of Scotland. It was not long, therefore, before hostilities were recommenced by the English. Lord Gray led an army into Scotland, fortified the town of Haddington, took the castles of Yester and Dalkeith, laid waste the Merse, and the counties of East and Mid-Lothian. On the other hand, in June 1548, Monsieur de Desse, a French officer of great reputation, landed at Leith with 6000 soldiers, and a formidable train of artillery.

In the mean time the regent was in disgrace on account of the disaster at Pinkey; and the queen-dowager being disposed to supersede his authority, attempted to improve this circumstance to her own advantage. As she perceived that her power and interest could best be supported by France, she resolved to enter into the strictest alliance with that kingdom. It had been proposed that the dauphin of France should marry the queen of Scotland; and this proposal now met with many partizans, the hostilities of the English having lost a great number of friends to the cause of that country. It was resolved to send the queen immediately to France, which would remove the cause of the present contentions, and her subsequent marriage with the dauphin would in the fullest manner confirm the friendship betwixt the two nations. The French government also entered deeply into the scheme; and in order to promote it made presents of great value to many of the Scottish nobility. The regent himself was gained over by a pension of 12,000 livres, and the title

502 The queen sent to France. of duke of Chatelherault. Monsieur de Villegagnon, who commanded four galleys in the harbour of Leith, making a feint as if he intended to proceed instantly to France, tacked about to the north, and, sailing round the isles, received the queen at Dumbarton; whence he conveyed her to France, and delivered her to her uncles the princes of Lorraine, in the month of July 1548.

These transactions did not put an end to the military operations. The siege of Haddington had been undertaken as soon as the French auxiliaries arrived, and was now conducted with vigour. To reinforce the

503 The English meet with several checks. garrison, 1500 horse advanced from Berwick; but an ambuscade being laid for them, they were intercepted, and almost totally destroyed. Another body of English troops, however, which amounted only to 300 persons, was more successful. Eluding the vigilance of the Scots and the French, they were able to enter Haddington, and to supply the besieged with ammunition and provisions. The Lord Seymour, high admiral of England, made a descent upon Fife with 1200 men, and some pieces of artillery; but was driven back to his ships with great slaughter by James Stuart, natural brother to the young queen, who opposed him at the head of the militia of the county. A second descent was made by him at Montrose; but being equally unsuccessful there, he was obliged to leave Scotland without performing any important or memorable achievement.

Having collected an army of 17,000 men, and adding to it 3000 German Protestants, the protector put it under the direction of the earl of Shrewsbury. Upon the approach of the English, Desse, though he had been reinforced with 15,000 Scots, thought it more prudent to retreat than to hazard a decisive battle. He raised the siege of Haddington, and marched to Edinburgh. The earl of Shrewsbury did not follow him to

504 Quarrels between the Scots and French. force an engagement. Jealousies had arisen between the Scots and the French. The insolence and vanity of the latter, encouraged by their superior skill in military arts, had offended the quick and impatient spirit of the former. The fretfulness of the Scots was augmented by the calamities inseparable from war; and after the conveyance of the young queen to France, the efficacious and peculiar advantage conferred upon that kingdom by this transaction was fully understood, and appeared to them to be highly disgraceful and impolitic. In this state of their humour, Desse found not at Edinburgh the reception he expected. The quartering of his soldiers produced disputes, which ended in an insurrection of the inhabitants. The French fired among the citizens. Several persons of distinction fell, and among these were the provost of Edinburgh and his son. The national discontents and inquietudes were driven, by this event, to the most dangerous extremity; and Desse, who was a man of ability, thought of giving employment to his troops, and of flattering the people by the splendour of some martial exploit.

505 Unsuccessful attempt on Haddington. The earl of Shrewsbury, after supplying Haddington with troops, provisions, and military stores, retired with his army into England. Its garrison, in the enjoyment of security, and unsuspicious of danger, might be surprised and overpowered. Marching in the night, Desse reached this important post; and destroying a fort of observation, prepared to storm the main gates of the city, when the garrison took the alarm. A French deserter pointing a double cannon to the thickest ranks of the assailants, the shot was incredibly destructive, and threw them into confusion. In the height of their consternation, a vigorous sally was made by the besieged. Desse renewed the assault in the morning, and was again discomfited. He now

506 Desse and the French gain several advantages. turned his arms against Broughty castle; and, though unable to reduce it, he yet recovered the neighbouring town of Dundee, which had fallen into the possession of the enemy. Hume castle was retaken by stratagem. Desse entered Jedburgh, and put its garrison to the sword. Encouraged by this success he ravaged the English borders in different incursions, and obtained several petty victories. Leith, which from a small village had grown into a town, was fortified by him; and the island of Inchkeith, which is nearly opposite to that harbour, being occupied by English troops, he undertook to expel them, and made them prisoners after a brisk encounter.

His activity and valour could not, however, compose the discontents of the Scottish nation; and the queen-dowager having written to Henry II. to recal him, he was succeeded in his command by Monsieur de Thermes, who was accompanied into Scotland by Monluc bishop of Valence, a person highly esteemed for his address and ability. This ecclesiastic was designed to supply the loss of Cardinal Beaton, and to discharge the office of lord high chancellor of Scotland. But the jealousies of the nation increasing, and the queen-dowager herself suspecting his ambition and turbulence, he obtained not this dignity, and soon returned to his own country.

De-

land.

?7 er. suc- of the h.

De Thermes brought with him from France a reinforcement of 1000 foot, 2000 horse, and 100 men at arms. He erected a fort at Aberlady, to distress the garrison of Haddington, and to intercept its supplies of provision. At Coldingham he destroyed a troop of Spaniards in the English pay. Fast-castle was regained by surprise. Distractions in the English court did not permit the protector to act vigorously in the war. The earl of Warwick was diverted from marching an army into Scotland. An infectious distemper had broke out in the garrison at Haddington; and an apprehension prevailed, that it could not hold out for any length of time against the Scots. The earl of Rutland, therefore, with a body of troops, entered the town; and after setting fire to it, conducted the garrison and artillery to Berwick. The regent, in the possession of Haddington, was solicitous to recover the other places which were yet in the power of the English. De Thermes laid siege to Broughty castle, and took it. He then besieged Lawder; and the garrison was about to surrender at discretion, when the news arrived that a peace was concluded between France, England, and Scotland.

08 con- l.

By this treaty Henry II. obtained the restitution of Boulogne and its dependencies, which had been taken from him by the king of England, and for which he paid 400,000 crowns. No opposition was to be given to the marriage of the queen of Scotland with the dauphin: the fortresses of Lawder and Douglas were to be restored to the Scots, and the English were to destroy the castles of Roxburgh and Eyemouth. After the ratification of the articles, the queen-dowager embarked with Leon Strozzi for France, attended by many of the nobility. Having arrived there, she communicated to the king her design of assuming the government of Scotland, and he promised to assist her to the utmost of his power. But the jealousy which prevailed between the Scots and French rendered the accomplishment of this design very difficult. To remove the regent by an act of power might endanger the scheme altogether; but it might be possible to persuade him to resign his office voluntarily. For this purpose intrigues were immediately commenced; and indeed the regent himself contributed to promote their schemes by his violent persecution of the reformed. The peace was hardly proclaimed, when he provoked the public resentment by an action of sanguinary insolence. Adam Wallace, a man of simple manners, but of great zeal for the Reformation, was accused of heresy, and brought to trial in the church of the Black Friars at Edinburgh. In the presence of the regent, the earls of Angus, Huntley, Glencairn, and other persons of distinction and rank, he was charged with preaching without any authority of law, with baptizing one of his own children, and with denying the doctrine of purgatory; and it was strenuously objected to him, that he accounted prayers to the saints and the dead to be an useless superstition, that he had pronounced the mass to be an idolatrous service, and that he had affirmed that the bread and wine in the sacrament of the altar, after the words of the consecration, do not change their nature, but continue to be bread and wine. These offences were esteemed too terrible to admit of any pardon.—The earl of Glencairn alone protested against his punishment. The pious sufferer bore with resignation the contumelious insults of the clergy; and by his courage and patience at the stake gave a sanction to the opinions he had embraced.

51 Other stances the reg inhuma and inj tice.

Other acts of atrocity and violence stained the administration of the regent. In his own palace, William Crichton, a man of family reputation, was assassinated by the Lord Semple. No attempt was made to punish the murderer. His daughter was the concubine of the archbishop of St Andrew's, and her tears and entreaties were more powerful than justice. John Melvil, a person respectable by his birth and his fortune, had written to an English gentleman, recommending to his care a friend who at that time was a captive in England. This letter contained no improper information in matters of state, and no suspicion of any crime against Melvil could be inferred from it. Yet the regent brought him to trial upon a charge of high treason; and, for an act of humanity and friendship, he was condemned to lose his head. The estate of Melvil, forfeited to his family, was given to David the youngest son of the regent.

51 Schem the qu dowag obtain regenc

Amidst the pleasures and amusements of the French court, the queen-dowager was not inattentive to the scheme of ambition which she had projected. The earls of Huntley and Sutherland, Marischal and Cassilis, with the Lord Maxwell, and other persons of eminence who had accompanied her to France, were gained over to her interests. Robert Carnegie of Kinnaird, David Panter bishop of Ross, and Gavin Hamilton commendator of Kilwinning, being also at this time in that kingdom, and having the greatest weight with the regent, were treated with a most punctilious respect. Henry declared to them his earnest wish that the queen-dowager might attain the government of Scotland. In case the regent should consent to this measure, he expressed a firm intention that no detriment should happen to his consequence and affairs; and he desired them to inform him, that he had already confirmed his title of *duke of Chatelherault*, had advanced his son to be captain of the Scots gendarmes in France, and was ready to tender other marks of favour to his family and relations. Upon this business, and with this message, Mr Carnegie was despatched to Scotland; and a few days after, he was followed by the bishop of Ross. The bishop being a man of eloquence and authority, obtained, though with great difficulty, a promise from the regent to resign his high office; and for this service he received, as a recompense, an abbey in Poitou.

51 She re to Scot land.

The queen-dowager, full of hopes, now prepared to return to Scotland, and in her way thither made use of a safe conduct obtained from Edward VI. by the king of France. The English monarch, however, had not yet forgot the beautiful queen of Scotland; and did not fail to urge his superiority of claim to her over the dauphin. The queen-dowager did not seriously enter upon the business; only in general terms complained of the hostilities committed by the English; and two days after this conversation, she proceeded towards Scotland, where she was conducted by the earl of Bothwel, Lord Hume, and some other noblemen, to Edinburgh, amidst the acclamations of the people. She had not long been returned to the capital, when the bad conduct of the regent afforded her an opportunity of exerting her influence and address to the advantage of her project. The regent having proposed a judicial circuit through the

Scotland.

514 Rapacity and injustice of the regent.

the kingdom, under pretence of repressing crimes and disorders, molested the people by plunder and rapine. Great fines were levied for offeoces pretended as well as real; and the Protestants in particular seemed to be the objects of his displeasure and severity. In his progress he was accompanied by the queen-dowager; and as she affected to behave in a maoner directly opposite, the most disagreeable comparisuns were made between her and the regent. The bishup of Ross, to whom he had promised to resign his office, did not fail to put him in mind of his engagements; but he had oow altered his mind, and wished still to continue in power. His resolutiun, however, failed him on the first intimation of a parliamentary inquiry into the errors of his administration.

515 resigns office, which is given to the queen-dowager.

An agreement with the queen-dowager then took place; and it was stipulated, that he should succeed to the throne upon the death of the queen without issue; that his son should enjoy the command of the gendarmes; that no inquiry shuuld be made into his expenditore of the royal treasures; that no inquiry into his government should take place; and that he should eojoy in the most ample manner his duchy and his pension. These articles were ratified at an assembly uf parliament, and the queen-dowager was surmally invested with the regency.

516 The renders herself unpopular.

Mary of Lorraine, the new regent, though she had with great difficulty attained the summit of her wishes, seemed to be much less versant in the arts of government than of intrigue. She was scarcely settled in her new office when she rendered herself unpopular in two respects; one was by her tuo great attachment to France, and the other by her persecution of the reformed religion. She was entirely guided by the councils of her brothers the duke of Guise and the cardinal of Lorraine; and paid by far too much attention to M. d'Oysel the French ambassador, whum they recommended to her as an able and faithful minister. Several high offices were filled with Frenchmen, which excited in the highest degree the resentment of the Scottish nobility; aod the commonalty were instantly prejudiced against her by the partiality she showed to the Papists. At first, however, she enacted many salutary laws; and while she made a progress herself through the southern provinces of the kingdom to hold justiciary courts, she endeavoured to introduce order and law into the western couoties and isles; first by the earl of Huntley, and afterwards by the earls of Argyll and Athol, to whom she granted commissions for this purpose with effectual powers.

517 attempts in vain to establish a standing army.

In another improvemeot, which the queen-regent attempted by the advice of her French council, she found herself opposed by her own people. It was proposed that the possessions of every proprietor of land in the kingdom should be valued and entered into registers; and that a proportional payment should be made by each. The application of this fund was to maintaio a regular aod standing body of soldiers. This guard or army, it was urged, being at all times in readiness to march against an enemy, would protect effectually the frontiers; and there would no longer be any necessity for the nobles to be continually in motion on every rumour of hostility or incursion from English invaders. No art, however, or argument, could recommend these measures. A perpetual tax and a standiog army were conceived to be the genuine characteristics of despotism. All ranks of men considered themselves insulted and abused; and 300 tenants of the crown assembling at Edinburgh, and giving way to their indignation, sent their remonstrances to the queen-regent in such strong and expressive language, as induced her to abandon the scheme. Yet still the attempt which she had made left an impression on the minds of the people. They suspected her to be a secret enemy to their government aod liberties; and they were convinced that Henry II. was engaging her in refinements and artifices, that he might reduce Scotland to be a province of France.

518 John Knox encourages the reformers.

While an alarm about their civil rights was spreading itself among the people, the Protestants were rising daily in their spirit and in their hopes. John Knox (r), whose courage had been confirmed by misfortunes, and whose talents had improved by exercise, was at this time making a prugress through Scotland. The characteristic peculiarities of Popery were the favourite topics of his declamation and censure. He treated the mass, in particular, with the most suvereign contempt, representing it as a remnant uf idolatry. Many of the nobility and gentry afforded him countenance and protectiun. They invited him to preach at their houses, and they partook with him in the ordinances of religion after the reformed method. Religious societies and assemblies were held publicly, in defiance of the Papists; and celebrated preachers were courted with assiduity and bribes to reside and officiate in particular districts and towns. The clergy cited him to appear before them at Edinburgh, in the church of the Blackfriars. Ou the appointed day he presented himself, with a numerous attendance uf gentlemen, who were determined tu exert themselves in his behalf. The priesthood did not choose to proceed in his prosecution; and Knox, encouraged by this symptom of their fear, touk the resolution to explain and inculcate his doctrines repeatedly and openly in the capital city of Scotland. In 1556, the earl of Glencairn allured the earl Marischal to hear the exhortations of this celebrated preacher; and they were so much affected with his reasonings and rhetoric, that they requested him to address the queen-regent upon the subject of the reformatiun of religion.

519 Writes an offensive letter to the queen regent.

In compliance with this request, he wrote a letter in very disagreeable terms; and the earl of Glencairn delivered it with his own hand, in the expectation that some advantage might in this manner be obtained for the reformed. But the queen-regent was no less offended with the freedom of the nobleman than the preacher; and, after perusing the paper, she gave it to James Beaton archbishop of Glasgow, with an expression of disdain, "Here, my lord, is a pasquil."

520 Goes to Geneva and is burnt in effigy.

Amidst these occupations, John Knox received an invitation to take the charge of the English congregation at Geneva; which he accepted. The clergy called upon him, in his absence, to appear before them, condemned

(r) When he was sent to France (says Dr Stuart), with the conspirators against Cardinal Beaton, he was confined to the galleys; but had obtained his liberty in the latter end of the year 1549.

ed him to death as a heretic, and ordered him to be burned in effigy.

21 The injurious treatment of John Knox did not in the leaſt obſtruct the progreſs of the Reformation. Deſertions were made from Popery in every town and village; and even many members of the church, both ſecular and regular, were forward to embrace the new principles, and to atone for their paſt miſtakes by the bittereſt railleries againſt the corruptions and the folly of the Romiſh faith. The prieſts were treated in all places with ridicule and contempt. The images, crucifixes, and relics, which ſerved to rouſe the decaying fervours of ſuperſtition, were ſtolen from the churches, and trampled under foot. The biſhops implored the aſſiſtance of the queen-regent. Citations were given to the preachers to appear in their defence. They obeyed; but with ſuch a formidable retinue, that it was with difficulty ſhe was permitted to apologize for her conduct. James Chalmers of Gaitgirth, preſſing forward from the crowd, addreſſed himſelf to her: "We vow to God, that the devices of the prelates ſhall not be carried into execution. We are oppreſſed to maintain them in their idleneſs. They ſeek to undo and murder our preachers and us; and we are determined to ſubmit no longer to this wickedneſs." The multitude, applauding his ſpeech, put their hands to their daggers.

A truſty meſſenger was deſpatched to Geneva, inviting John Knox to return to his own country. But in the infancy of their connexion, the Proteſtants being apprehenſive of one another, uncertain in their counſels, or being deſerted by perſons upon whom they had relied, it appeared to them that they had adopted this meaſure without a due preparation; and, by oppoſite deſpatches, Knox was requeſted to delay his journey for ſome time.

To this zealous reformer their unſteadineſs was a matter of ſerious affliction; and in the anſwer he tranſmitted to their letters, he rebuked them with ſeverity: but amidſt this correction, he entreated them not to faint under their purpoſes, from apprehenſions of danger, which, he ſaid, was to ſeparate themſelves from the favour of God, and to provoke his vengeance. To particular perſons he wrote other addreſſes; and to all of them the greateſt attention was paid. In 1557, a formal bond of agreement, which obtained the appellation

22 of *the firſt covenant*, was entered into, and all the more eminent perſons who favoured the Reformation were invited to ſubſcribe it. The earls of Argyll, Glencairn, and Morton, with the Lord Lorn, and John Erſkine of Dun, led the way, by giving it the ſanction of their names. All the ſubſcribers to this deed, renouncing the ſuperſtitions and idolatry of the church of Rome, promiſed to apply continually their whole power and wealth, and even to give up their lives, to forward and eſtabliſh the word of God. They diſtinguiſhed the reformed, by calling them the *Congregation of Chriſt*; and by the opprobrious title of the *Congregation of Satan*, they peculiarized the favourers of Popery.

23 After the leaders of the Reformation had ſubſcribed the firſt covenant, they addreſſed letters to John Knox, urging in the ſtrongeſt terms his return to Scotland; and that their hopes of his aſſiſtance might not be diſappointed, they ſent an addreſs to John Calvin, the celebrated reformer, begging him to join his commands to their entreaties. The archbiſhop of St Andrew's, who perceived the riſing ſtorm, was in a difficult ſituation. A powerful combination threatened ruin to the church; and he had ſeparated himſelf from the politics of the queen-regent. The zeal of the Roman Catholics pointed out ſtrong meaſures to him; and his diſpoſitions were pacific. The clergy were offended with his remiſſneſs and neglect of duty. The reformers deteſted his looſeneſs of principles, and were ſhocked with the diſſolute depravity of his life and converſation. He reſolved to try the force of addreſs, and did not ſucceed. He then reſolved to be ſevere, and was ſtill more unſucceſsful.

52 The earl of Argyll was the moſt powerful of the reformed leaders. To allure him from his party, the archbiſhop of St Andrew's employed the agency of Sir David Hamilton. But the kindneſs he affected, and the advices he beſtowed, were no compliment to the underſtanding of this nobleman; and his threats were regarded with ſcorn. The reformers, inſtead of loſing their courage, felt a ſentiment of exultation and triumph; and the earl of Argyll happening to die about this time, he not only maintained the new doctrines in his laſt moments, but entreated his ſon to ſeek for honour in promoting the public preaching of the goſpel of Jeſus Chriſt, and in the utter ruin of ſuperſtition and idolatry.

It was determined by the archbiſhop and the prelates, that this diſappointment ſhould be ſucceeded by furious perſecution of the reformed. Walter Mill, a prieſt, had neglected to officiate at the altar; and having been long under the ſuſpicion of hereſy, was carried to St Andrew's, committed to priſon, and accuſed before the archbiſhop and his ſuffragans. He was in an extreme old age; and he had ſtruggled all his life with poverty. He ſunk not, however, under the hardneſs of his fate. To the articles of his accuſation he replied with ſignal recollection and fortitude. The firmneſs of his mind, in the emaciated ſtate of his body, excited admiration. The inſults of his enemies, and their contempt, ſerved to diſcover his ſuperiority over them. When the clergy declared him a heretic, no temporal judge could be found to condemn him to the fire. He was reſpited to another day; and ſo great ſympathy prevailed for his misfortunes, that it was neceſſary to allure one of the archbiſhop's domeſtics to ſupply the place of the civil power, and to pronounce the ſentence of condemnation. When brought to the ſtake, the reſolution of this ſufferer did not forſake him. He praiſed God, that he had been called to ſeal up the truth with his life; and he conjured the people, as they would eſcape eternal death, not to be overcome by the errors and the artifices of monks and prieſts, abbots and biſhops.

The barbarity of this execution affected the reformers with inexpreſſible horror. Subſcriptions for mutual defence were taken. The leaders of the Reformation, diſperſing their emiſſaries to every quarter, encouraged the vehemence of the multitude. The covenant to eſtabliſh a new form of religion extended far and wide. The ſharp point of the ſword, not the calm exertions of inquiry, was to decide the diſputes of theology.

When the leaders of the Reformation were appriſed of the ardent zeal of the people, and conſidered the great number of ſubſcriptions which had been collected in the different counties of the kingdom, they aſſembled

[otland.] [527 ...ition ...queen-regent.]

to deliberate concerning the steps to be pursued. It was resolved, accordingly, that a public and common supplication of the whole body of the Protestants should be presented to the queen regent; which, after complaining of the injuries they had suffered, should require her to bestow upon them her support and assistance, and urge her to proceed in the work of a reformation. To explain their full meaning, a schedule, containing particular demands, was at the same time to be presented to her scrutiny. To Sir James Sandilands of Calder they committed the important charge of their manifesto and articles of reformation; and in appointing him to this commission, they consulted the respect which was due both to the government and to themselves. His character was in the highest estimation. His services to his country were numerous; his integrity and honour were superior to all suspicion; and his age and experience gave him authority and reverence.

The petition or supplication of the Protestants was expressed in strong but respectful terms. They told the queen-regent, that though they had been provoked by great injuries, they had yet, during a long period, abstained from assembling themselves, and from making known to her their complaints. Banishment, confiscation of goods, and death in its most cruel shape, were evils with which the reformed had been afflicted; and they were still exposed to these dreadful calamities. Compelled by their sufferings, they presumed to ask a remedy against the tyranny of the prelates and the estate ecclesiastical. They had usurped an unlimited domination over the minds of men. Whatever they commanded, though without any sanction from the word of God, must be obeyed. Whatever they prohibited, though from their own authority only, it was necessary to avoid. All arguments and remonstrances were equally fruitless and vain. The fire, the faggot, and the sword, were the weapons with which the church enforced and vindicated her mandates. By these, of late years, many of their brethren had fallen; and upon this account they were troubled and wounded in their consciences. For conceiving themselves to be a part of that power which God had established in this kingdom, it was their duty to have defended them, or to have concurred with them in an open avowal of their common religion. They now take the opportunity to make this avowal. They break a silence which may be misinterpreted into a justification of the cruelties of their enemies. And disdaining all farther dissimulation in matters which concern the glory of God, their present happiness, and their future salvation, they demand, that the original purity of the Christian religion shall be restored, and that the government shall be so improved, as to afford to them a security in their persons, their opinions, and their property.

With this petition or supplication of the Protestants, Sir James Sandilands, presented their schedule of demands, or the preliminary articles of the Reformation. They were in the spirit of their supplication, and of the following tenor:

[528 ...icles of ...Refor-...ion.]

I. It shall be lawful to the reformed to peruse the Scriptures in the vulgar tongue; and to employ also their native language in prayer publicly and in private.

II. It shall be permitted to any person qualified by knowledge, to interpret and explain the difficult passages in the Scriptures.

[Bra...]

III. The election of ministers shall take place according to the rules of the primitive church; and those who elect shall inquire diligently into the lives and doctrines of the persons whom they admit to the clerical office.

IV. The holy sacrament of baptism shall be celebrated in the vulgar tongue, that its institution and nature may be the more generally understood.

V. The holy sacrament of the Lord's supper shall likewise be administered in the vulgar tongue; and in this communion, as well as in the ceremonial of baptism, a becoming respect shall be paid to the plain institution of Christ Jesus.

VI. The wicked and licentious lives of the bishops and estate ecclesiastical shall be reformed; and if they discharge not the duties of true and faithful pastors, they shall be compelled to desist from their ministry and functions.

[5... The ...stants ...tered the q... regen...]

The queen-regent now found it necessary to flatter the Protestants. She assured them by Sir James Sandilands, their orator or commissioner, that every thing they could legally desire should be granted to them; and that, in the mean time, they might, without molestation, employ the vulgar tongue in their prayers and religious exercises. But, upon the pretence that no encouragement might be given to tumults and riot, she requested that they would hold no public assemblies in Edinburgh or Leith. The Congregation, for this name was now assumed by the Protestants, were transported with these tender proofs of her regard; and while they sought to advance still higher in her esteem by the inoffensive quietness of their carriage, they were encouraged in the undertaking they had begun, and anxious to accomplish the work of the Reformation.

[5... They ...to dis... with Refor... clergy.]

Nor to the clergy, who at this time were holding a provincial council at Edinburgh, did the Congregation scruple to communicate the articles of the intended reformation. The clergy received their demands with a storm of rage, which died away in an innocent debility. Upon recovering from their passions, they offered to submit the controversy between them and the reformed to a public disputation. The Congregation did not refuse this mode of trial; and desired, as their only conditions, that the Scriptures might be considered as the standards of orthodoxy and truth, and that those of their brethren who were in exile and under persecution might be permitted to assist them. These requests, though reasonable in a high degree, were not complied with; and the church would allow no rule of right but the canon law and its own councils. Terms of reconciliation were then offered on the part of the estate ecclesiastical. It held out to the Protestants the liberty of praying and administering the sacraments in the vulgar tongue, if they would pay reverence to the mass, acknowledge purgatory, invoke the saints, and admit of petitions for the dead. To conditions so ineffectual and absurd the Congregation did not deign to return any answer.

The meeting of the parliament approached. The parties in contention were agitated with anxieties, apprehensions, and hopes. An expectation of a firm and open assistance from the queen-regent gave courage to the reformed; and, from the parliamentary influence of their friends in the greater and the lesser baronage, they expected the most important services. They drew up with eagerness the articles which they wished to be

passed into a law; and as the spirit and sense of their transactions are to be gathered in the completest manner from the papers which were framed by themselves, it is proper to attend to them with a punctilious exactness. Their petitions were few and explicit.

I. They could not, in consequence of principles which they had embraced from a conviction of their truth, participate in the Romish religion. It was therefore their desire, that all the acts of parliament, giving authority to the church to proceed against them as heretics, should be abrogated; or, at least, that their power should be suspended till the disputes which had arisen were determined and brought to a conclusion.

II. They did not mean that all men should be at liberty to profess what religion they pleased, without the controul of authority. They consented that all transgressors in matters of faith should be carried before the temporal judge. But it was their wish that the clergy should have only the power to accuse; and they thought it conformable to justice, that a copy of the criminal charge should be lodged with the party upon trial, and that a competent time should be allowed him to defend himself.

III. They insisted, that every defence consistent with law should be permitted to the party accused; and that objections to witnesses, founded in truth and reason, should operate to his favour.

IV. They desired that the party accused should have permission to interpret and explain his own opinions; and that his declaration should carry a greater evidence than the deposition of any witness: as no person ought to be punished for religion, who is not obstinate in a wicked or damnable tenet.

V. In fine, they urged, that no Protestant should be condemned for heresy, without being convicted, by the word of God, of the want of that faith which is necessary to salvation.

The Congregation presented these articles to the queen-regent, expecting that she would not only propose them to the three estates assembled in parliament, but employ all her influence to recommend them. But finding themselves disappointed, they began to suspect her sincerity; and they were sensible that their petitions, though they should be carried in parliament, could not pass into a law without her consent. They therefore abstained from presenting them; but as their complaints and desires were fully known in parliament, they ordered a solemn declaration to be read there in their behalf, and demanded that it should be inserted in the records of the nation. In this declaration, after expressing their regret for having been disappointed in their scheme of reformation, they protested, that no blame should be imputed to them for continuing in their religion, which they believed to be founded in the word of God; that no danger of life, and no political pains, should be incurred by them, for disregarding statutes which support idolatry, and for violating rites which are of human invention; and that, if insurrections and tumults should disturb the realm, from the diversity of religious opinions, and if abuses should be corrected by violence, all the guilt, disorder, and inconvenience thence arising, instead of being applied to them, should be ascribed to those solely who had refused a timely redress of wrongs, and who had despised petitions presented with the humility of faithful subjects, and for the purposes of establishing the commandments of God, and a most just and salutary reformation.

The three estates received this formidable protest with attention and respect; but the intention of inserting it in the national records was abandoned by the Congregation, upon a formal promise from the queen-regent, that all the matters in controversy should speedily be brought by her to a fortunate issue.

While the Protestants were thus making the most vigorous exertions in behalf of their spiritual liberties, the queen-regent, in order to establish herself the more effectually, used every effort to promote the marriage of her daughter with the dauphin of France. In 1557, commissioners were appointed to negotiate this marriage; but while these negotiations were going on, the court of France acted in the most perfidious manner. At the age of 15, after solemnly ratifying the independency of Scotland, and the succession of the crown in the house of Hamilton, Queen Mary was influenced by the king and her uncles the princes of Lorraine to sign privately three extraordinary deeds or instruments. By the first she conveyed the kingdom of Scotland to the king of France and his heirs, in the default of children of her own body. By the second she assigned him, if she should die without children, the possession of Scotland, till he should receive a million of pieces of gold, or be amply recompensed for the sums expended by him in the education of the queen of Scotland in France. By the third she confirmed both these grants in an express declaration, that they contained the pure and genuine sentiments of her mind; and that any papers which might be obtained, either before or after her marriage, by means of the Scottish parliament, should be invalid, and of no force nor efficacy. On the 24th of April, the nuptials were celebrated; and the dauphin, Francis, was allowed to assume the title of king of Scotland. The French court demanded for him the crown and other ensigns of royalty belonging to Scotland; but the commissioners had no power to comply with their request. It was then desired, that when they returned home, they should use all their influence to procure the crown-matrimonial of Scotland for the dauphin. This also was refused; the court of France was disgusted; and four of the commissioners died, it was supposed of poison, given them by the princes of Lorraine. This subject, however, was pressed, on the return of the surviving commissioners, by the king of France himself, the queen of Scotland, and the queen-regent. The Protestants also joined their interest, hoping by that means to gain over the queen and queen-regent to their party; so that an act of parliament was at length passed, by which the crown-matrimonial was given to the dauphin during the time of his marriage with Queen Mary; but without any prejudice to the liberties of the kingdom, to the heirs of her body, or to the order of succession. With so many restraints, it is difficult to see the advantages which could accrue from this gift so earnestly sought after; and it is very probable, that the usurpations of France in consequence of it, would have been productive of many disturbances; but these were prevented by the death of Francis in December 1560.

But before this event took place, Scotland was, by the intrigues of France, involved in confusion on another account. After the death of Mary queen of England,

land, and daughter to Henry VIII. the princes of Guise insisted on the claim of Mary queen of Scots to the crown of England, in preference to that of Elizabeth, whom they looked upon as illegitimate. This claim was supported by the king of France, who prevailed with the queen of Scots herself to assume the title of queen of England, and to stamp money under that character. The arms of England were quartered with those of France and Scotland: and employed as ornaments for the plate and furniture of Mary and the dauphin. Thus was laid the foundation of an irreconcileable quarrel between Elizabeth and Mary; and to this, in some measure, are we to ascribe the inveteracy with which the former persecuted the unhappy queen of Scotland, at every time she had it in her power.

But while they imprudently excited a quarrel with England, they yet more imprudently quarrelled also with the majority of the people of Scotland. As Elizabeth professed the Protestant religion, it was easily foreseen, that the *Congregation*, or body of the reformed in Scotland, would never consent to act against her in favour of a Popish power; and as they could not be gained, it was resolved to destroy them at once, by putting to death all their leaders. The queen-regent gave intimation of her design to re-establish Popery, by proclaiming a solemn observance of Easter, receiving the sacrament according to the Romish communion, herself, and commanding all her household to receive it in the same manner. She next expressed herself in a contemptuous manner against the reformed, affirmed that they had insulted the royal dignity, and declared her intention of restoring it to its ancient lustre. The preachers of the Congregation were next cited to appear at Stirling, to answer the charges which might be brought against them. Alexander earl of Glencairn, and Sir Hugh Campbell of Loudon, were deputed to admonish her not to persecute the preachers, unless they had been obnoxious by circulating erroneous doctrines, or disturbing the peace of government. The queen-regent in a passion told them, that the preachers should all be banished Scotland, though their doctrines were as sound as those of St Paul. The deputies urged her former kind behaviour and promises; but the queen-regent answered, that "the promises of princes ought not to be exacted with rigour, and that they were binding only when subservient to their conveniency and pleasure." To this they replied, that in such a case they could not look upon her as their sovereign, and must renounce their allegiance as subjects.

Soon after this transaction, the queen-regent received the news that the Reformation was established in Perth. Lord Ruthven the provost of the city was summoned to answer for this innovation; but his reply was, that he had no dominion over the minds and consciences of men. The provost of Dundee, being ordered to apprehend an eminent preacher, named *Paul Methven*, sent him intelligence of the order, that he might provide for his safety. The proclamation for observing Easter was everywhere despised and neglected, and people exclaimed against the mass as an idol. New citations, in the mean time, had been given to the preachers to appear at Stirling. They obeyed the summons; but attended by such multitudes, that the queen-regent, dreading their power, though they were without arms, entreated Mr Erskine of Dun, whom they had sent before as a deputy, to stop their march; assuring him that all proceedings against the preachers should be stopped. In consequence of this, the multitude dismissed; yet, when the day came on which the preachers should have appeared, the queen-regent, with unparalleled folly as well as treachery, caused them to be declared traitors, and proclaimed it criminal to afford them any subsistence.

Mr Erskine, exasperated by this shameful conduct, hastened to the Congregation, apologized for his conduct, and urged them to proceed to the last extremities. At this critical period also John Knox returned from Geneva, and joined the Congregation at Perth. The great provocations which the Protestants had already received, joined to the impetuous passions of the multitude, were now productive of the greatest disorders. Images were destroyed, monasteries pulled down, and their wealth either seized by the mob or given to the poor. The example of Perth was followed by Cupar in Fife; and similar insurrections being apprehended in other places, the queen-regent determined to punish the inhabitants of Perth in the most exemplary manner. With this view she collected an army: but being opposed with a formidable power by the Protestants, she thought proper to conclude an agreement. The Protestants, however, dreaded her insincerity; and therefore entered into a new covenant to stand by and defend one another. Their fears were not vain. The queen-regent violated the treaty almost as soon as made, and began to treat the Protestants with severity. The earl of Argyll, and the prior of St Andrew's, who about this time began to take the title of *Lord James Stuart*, now openly headed the Protestant party, and prepared to collect their whole strength. The queen-regent opposed them with what forces she had, and which indeed chiefly consisted of her French auxiliaries; but, being again afraid of coming to an engagement, she consented to a truce until commissioners should be sent to treat with the lords of an effectual peace. No commissioners, however, were sent on her part; and the nobles, provoked at such complicated and unceasing treachery, resolved to push matters to the utmost extremity. The first exploit of the reformed was the taking of the town of Perth, where the queen-regent had placed a French garrison. The multitude, elated with this achievement, destroyed the palace and abbey of Scone, in spite of all the endeavours of their leaders, even of John Knox himself, to save them. The queen-regent, apprehensive that the Congregation would commit farther ravages to the southward, resolved to throw a garrison into Stirling; but the earl of Argyll and Lord James Stuart were too quick for her, and arrived there the very day after the demolition of the abbey and palace of Scone. The people, incapable of restraint, and provoked beyond measure by the perfidious behaviour of the Catholic party, demolished all the monasteries in the neighbourhood, together with the fine abbey of Cambuskenneth, situated on the north bank of the Forth. From Stirling they went to Linlithgow, where they committed their usual ravages; after which, they advanced to Edinburgh. The queen-regent, alarmed at their approach, fled to Dunbar; and the Protestants took up their residence in Edinburgh.

Having thus got possession of the capital, the Con-

gregation assumed to themselves the ruling power of the kingdom, appointed preachers in all the churches, and seized the mint, with all the instruments of coining. The queen-regent, unable to dispute the matter in the field, published a manifesto, in which she set forth their seditious behaviour, commanding them to leave Edinburgh within six hours, and enjoining her subjects to avoid their society under the pain of treason. The Congregation having already lost somewhat of their popularity by their violent proceedings, were now incapable of coping with government. As they had not established themselves in any regular body, or provided a fund for their support, they felt their strength decay, and multitudes of them returned to their habitations. Those who remained found themselves obliged to vindicate their conduct; and, in an address to the regent, to disclaim all treasonable intentions. Negotiations again took place, which ended as usual; the queen-regent, who had taken this opportunity of collecting her forces, marched against the Congregation on the 23d of July 1559. The Protestants now found themselves incapable of making head against their enemies; and therefore entered into a negotiation, by which all differences were for the present accommodated. The terms of this treaty were, that the town of Edinburgh should be open to the queen-dowager and her attendants; that the palace of Holyroodhouse and the mint should be delivered up to her; that the Protestants should be subject to the laws, and abstain from molesting the Roman Catholics in the exercise of their religion. On the queen's part, it was agreed, that the Protestants should have the free exercise of their religion, and that no foreign troops should enter the city of Edinburgh.

Notwithstanding this treaty, however, the reformed had no confidence in the queen's sincerity. Having heard of the death of Henry II. of France, and the accession of Francis II. and Mary to that kingdom, they seem to have apprehended more danger than ever. They now entered into a third covenant; in which they engaged themselves to refuse attendance to the queen-dowager, in case of any message or letter; and that immediately on the receipt of any notice from her to any of their number, it should be communicated without reserve, and be made a common subject of scrutiny and deliberation. It was not long before they had occasion for all their constancy and strength. The queen-regent repented of the favourable terms she had granted the reformed; and being denied the favour which she requested of saying mass in the high-church of Edinburgh, she ordered them to be everywhere disturbed in the exercise of their religion.

In this imprudent measure, the queen-regent was confirmed by letters which now came from Francis and Mary, promising a powerful army to support her interests. The envoy who brought these despatches also carried letters to the lord James Stuart, now the principal leader of the Protestants, and natural brother to the queen. The letters were filled with reproaches and menaces, mixed with entreaties; and along with them the envoy delivered a verbal message, that the king his master was resolved rather to expend all the treasures of France than not to be revenged on the rebellious noblemen who had disturbed the peace of Scotland. The lord James Stuart was not to be frightened by these menaces. He returned a cool and deliberate answer, apologizing for the Protestants, and vindicating them from the charge of rebellion; but at the same time intimating his full resolution of continuing to head the reformed as he had already done.

551 French auxiliaries arrive, which alarms the nation.

The letters of Francis and Mary were soon followed by 1000 French soldiers, with money and military stores; and the commander was immediately despatched again to France, to solicit the assistance of as many more soldiers, with four ships of war, and 100 men-at-arms. But before he could set out, La Brosse, another French commander, arrived with 2000 infantry; and that the Congregation might be defeated not only by arms but in disputation, the same ship brought three doctors of the Sorbonne, to show the pernicious tendency of the new doctrines. Thus matters were pushed on beyond all hopes of reconciliation. The nation was universally alarmed on account of the introduction of French troops, to which they saw no end. The queen-regent attempted to quiet the minds of the public by a proclamation; but their fears increased the more. The Congregation assembled at Stirling, where they were joined by the earl of Arran, and soon after by his father the duke of Chatelherault. They next deliberated on the measures to be followed with the queen-regent: and the result of their consultations was, that an expostulatory letter should be addressed to her. This was accordingly done; but as the queen behaved with her usual duplicity, the nobles called the people to arms. Mutual manifestos were now published; and both parties prepared to decide the contest by the sword. The Congregation having seized Broughty castle, marched from thence to Edinburgh. The queen-regent retired to Leith, which she had fortified and filled with French troops. Thither the nobles sent their last message to her, charging her with a design to overthrow the civil liberties of the kingdom. They requested her to command her Frenchmen and mercenaries to depart from Leith, and to make that place open and patent, not only to the inhabitants who had been dispossessed of their houses, but to all the inhabitants of Scotland. They declared, that her denial of this request should be considered by them as a proof of her intention to reduce the kingdom to slavery; in which case, they were determined to employ their utmost power to preserve its independency. Two days after this message, the queen-regent sent to them the Lord Lyon, whom she enjoined to tell them, that she considered their demand not only as presumptuous, but as an encroachment on the royal authority; that it was an indignity to her to be dictated to by subjects; that Frenchmen were not to be treated as foreigners, being entitled to the same privileges with Scotsmen; and that she would neither disband her troops, nor command the town of Leith to be made open and patent. The Lord Lyon then, in the name of the queen-regent, commanded the lords of the Congregation to depart from Edinburgh, and disperse themselves, under the pain of high treason. The Protestants, irritated by this answer, after some deliberation degraded the queen-regent; and to this purpose the nobility, barons, and burgesses, all agreed to subscribing an edict, which was sent to the principal cities in Scotland, and published in them.

552 The nobles send their last message to the queen-regent.

553 Receive an unfavourable answer.

554 They degrade her from her office, and lay siege to Leith.

The next step taken by the Congregation was to summon

summon Leith to surrender; but meeting with defiance instead of submission, it was resolved to take the town by scalade. For this service ladders were framed in the church of St Giles's; a business which, interrupting the preachers in the exercise of public worship, made them prognosticate misfortune and miscarriage to the Congregation. In the displeasure of the preachers, the common people found a source of complaint; and the emissaries of the queen-dowager acting with indefatigable industry to divide her adversaries, and to spread chagrin and dissatisfaction among them, discontent, animosity, and terror, came to prevail to a great degree. The duke of Chatelherault discouraged many by his example. Defection from the Protestants added strength to the queen-dowager. The most secret deliberations of the confederated lords were revealed to her. The soldiery were clamorous for pay; and it was very difficult to procure money to satisfy their claims. Attempts to sooth and appease them, discovering their consequence, engendered mutinies. They put to death a domestic of the earl of Argyll, who endeavoured to compose them to order; they insulted several persons of rank who discovered a solicitude to pacify them; and they even ventured to declare, that, for a proper reward, they were ready to suppress the Reformation, and to re-establish the mass.

It was absolutely necessary to give satisfaction to the Protestant soldiers. The lords and gentlemen of the Congregation collected a considerable sum among them; but it was not equal to the present exigency. The avarice of many taught them to withhold what they could afford, and the poverty of others did not permit them to indulge their generosity. It was resolved, that each nobleman should surrender his silver plate to be struck into money. By the address, however, of the queen-dowager, the officers of the mint were bribed to conceal, or to convey to a distance, the stamps and instruments of coinage. A gloomy despair gave disquiet to the Congregation, and threatened their ruin. Queen Elizabeth, with whose ministers the confederated lords maintained a correspondence at this time, had frequently promised them her assistance; but they could not now wait the event of a deputation to the court of England. In an extremity so pressing, they therefore applied for a sum of money to Sir Ralph Sadler and Sir James Croft, the governors of Berwick; and Cockburn of Ormiston, who was intrusted with this commission, obtained from them an aid of 4000 crowns. Traitors, however, in the councils of the Congregation, having informed the queen-dowager of his errand and expedition, the earl of Bothwel, by her order, intercepted him upon his return, discomfited his retinue, and made a prize of the English subsidy.

To rouse the spirit of the party, an attack was projected upon Leith, and some pieces of artillery were planted against it. But before any charge could be made, the French soldiers sallied out to give battle to the troops of the Congregation, possessed themselves of their cannon, and drove them back to Edinburgh. A report that the victors had entered this city with the fugitives, filled it with disorder and dismay. The earl of Argyll and his Highlanders hastened to recover the honour of the day, and harassed the French in their retreat. This petty conflict, while it elated the queen-dowager, served to augment the despondence of the Protestants.

Vain of their prowess, the French made a new sally from Leith, with a view to intercept a supply of provisions and stores for the Congregation. The earl of Arran and the lord James Stuart advanced to attack them, and obliged them to retire. But pursuing them with too much heat, a fresh body of French troops made its appearance. It was prudent to retreat, but difficult. An obstinate resistance was made. It was the object of the French to cut off the soldiery of the Congregation from Edinburgh, and by these means to divide the strength of that station. The earl of Arran and the lord James Stuart had occasion for all their address and courage. Though they were able, however, to effect their escape, their loss was considerable, and the victory was manifestly on the side of their adversaries.

About this time William Maitland of Lethington, secretary to the queen-dowager, withdrew secretly from Leith, and joined himself to the confederated nobles. He had been disgusted with the jealousies of the French counsellors, and was exposed to danger from having embraced the doctrines of the reformed. His reception was cordial, and corresponded to the opinion entertained of his wisdom and experience. He was skilled in business, adorned with literature, and accustomed to reflection. But as yet it was not known, that his want of integrity was in proportion to the greatness of his talents.

The accession of this statesman to their party could not console the lords of the Congregation for the unpromising aspect of their affairs. The two discomfitures they had received sunk deeply into the minds of their followers. Those who affected prudence, retired privately from a cause which they accounted to be desperate; and the timorous fled with precipitation. The wailings and distrust of the brethren were melancholy and infectious; and by exciting the ridicule and scorn of the partisans of the queen-dowager, were augmented the more. A distress not to be comforted seemed to have invaded the Protestants; and the associated nobles consented to abandon the capital. A little after midnight, they retired from Edinburgh; and so great was the panic which prevailed, that they marched to Stirling without any stop or intermission.

John Knox, who had accompanied the Congregation to Stirling, anxious to recover their unanimity and courage, addressed them from the pulpit. He represented their misfortunes as the consequences of their sins; and entreating them to remember the goodness of their cause, assured them in the end of joy, honour, and victory. His popular eloquence corresponding to all their warmest wishes, diffused satisfaction and cheerfulness. They passed from despair to hope. A council was held, in which the confederated nobles determined to solicit, by a formal embassy, the aid of Queen Elizabeth. Maitland of Lethington, and Robert Melvil, were chosen to negotiate this important transaction; and they received the fullest instructions concerning the state and difficulties of the Congregation, the tyrannical designs of the queen-dowager, and the danger which threatened England from the union of Scotland with France.

The queen of England having maturely considered the

the cafe, determined to affift the reformers; whofe leaders now difperfed themfelves, and went to different parts of the kingdom, in order to employ their activity there for the common caufe. The queen-dowager, imagining that the lords were fled, conceived great hopes of being able to crufh the reformed at once. Her fanguine hopes, however, were foon checked, on receiving certain intelligence that Queen Elizabeth was refolved to give them affiftance. She now took the beft meafures poffible, as circumftances ftond; and determined to crufh her enemies before they could receive any affiftance from England. Her French troops took the road to Stirling, and wafted in their march all the grounds which belonged to the favourers of the Reformation. After renewing their depredations at Stirling, they paffed the bridge there; and proceeding along the fide of the river, exercifed their cruelties and oppreffions in a diftrict which had diftinguifhed itfelf by an ardent zeal againft Popery. While the terror of their arms was thus diffufing itfelf, they refolved to feize the town and caftle of St Andrew's, which they confidered as an important military ftation, and as a convenient place of reception for the auxiliaries they expected from France.

But the lord James Stuart employed himfelf to interrupt their progrefs and retard their attempts; and it was his object at the fame time, to keep the force of the Congregation entire, to hazard no action of importance, and to wait the approach of the Englifh army. A fmall advantage was obtained by the French at Petticur; and they poffeffed themfelves of Kinghorn. The lord James Stuart, with 500 horfe and 100 foot, entered Dyfart. With this inconfiderable ftrength he propofed to act againft an army of 4000 men. His admirable fkill in military affairs, and his heroic courage, were eminently difplayed. During 20 days he prevented the march of the French to St Andrew's, intercepting their provifions, haraffing them with fkirmifhes, and intimidating them by the addrefs and the boldnefs of his ftratagems.

Monfieur d'Oyfel, enraged and afhamed to be difconcerted and oppofed by a body of men fo difproportioned to his army, exerted himfelf with vigour. The lord James Stuart was obliged to retire. Dyfart and Wemyfs were given to the French troops to be pillaged; and when d'Oyfel was in full march to St Andrew's, he difcovered a powerful fleet bearing up the frith. It was concluded, that the fupplies expected from France were arrived. Guns were fired by his foldiers, and their joy was indulged in all its extravagance. But this fleet having taken the veffels which contained their provifions, and the ordnance with which they intended to improve the fortifications of the caftle at St Andrew's, a period was put to their rejoicings. Certain news was brought that the fleet they obferved was the navy of England, which had come to fupport the Congregation. A confternation, heightened by the giddinefs of their preceding tranfports, invaded them. Monfieur d'Oyfel perceived now the value and merit of the fervice which had been performed by the lord James Stuart; and thinking no more of St Andrew's and conqueft, fled to Stirling, in his way to Leith, from which he dreaded to be intercepted; but he reached that important ftation after a march of three days.

A formal treaty was now concluded between the lords of the Congregation and Queen Elizabeth; and in the mean time the queen-dowager was difappointed in her expectations from France. The violent adminiftration of the houfe of Guife had involved that nation in troubles and diftrefs. Its credit was greatly funk, and its treafury was nearly exhaufted. Perfecutions, and the fpirit of Calvinifm, produced commotions and confpiracies; and amidft domeftic and dangerous intrigues and ftruggles, Scotland failed to engage that particular diftinction which had been promifed to its affairs. It was not, however, neglected altogether. The count De Martigues had arrived at Leith with 1000 foot and a few horfe. The marquis D'Elbeuf had embarked for it with another body of foldiers; but, after lofing feveral fhips in a furious tempeft, was obliged to return to the haven from which he had failed.

In this fad reverfe of fortune many forfook the queen-dowager. It was now underftood that the Englifh army was upon its march to Scotland. The Scottifh lords who had affected a neutrality, meditated an union with the Proteftants. The earl of Huntley gave a folemn affurance that he would join them. Proclamations were iffued throughout the kingdom, calling upon the fubjects of Scotland to affemble in arms at Linlithgow, to re-eftablifh their ancient freedom, and to affift in the utter expulfion of the French foldiery.

The Englifh fleet, meanwhile, under Winter the vice-admiral, had taken and deftroyed feveral fhips, had landed fome troops upon Inchkeith, and difcomfited a body of French mercenaries. Upon the foundation of thefe acts of hoftility, the princefs of Lorraine defpatched the chevalier de Seure to Queen Elizabeth, to make reprefentations againft this breach of the peace, and to urge the recal of her fhips. This ambaffador affected likewife to negotiate concerning the evacuation of Scotland by the French troops, and to propofe methods by which the king of France might quarter the arms of England without doing a prejudice to Queen Elizabeth. But to prevent the execution of vigorous refolutions againft the queen-dowager, and to gain time, were the only objects he had in view. With fimilar intentions, John Monluc bifhop of Valence, a man of greater addrefs and ability, and equally devoted to the houfe of Guife, was alfo fent at this time to the court of England. Queen Elizabeth, however, and her minifters, were too wife to be amufed by artifice and dexterity. The lord Grey entered Scotland with an army of 1200 horfe and 6000 foot; and the lord Scroop, Sir James Croft, Sir Henry Percy, and Sir Francis Lake commanded under him. By an inclement policy, the queen-dowager had already wafted all the country around the capital. But the defolation fhe had made, while it was ruinous to the Scottifh peafants, affected not the army of England. The leaders of the Congregation did not want penetration and forefight, and had provided themfelves againft this difficulty. The duke of Chatelherault, the earls of Argyll, Glencairn, and Menteith, the lord James Stuart, and the lords Ruthven, Boyd, and Ochiltree, with a numerous and formidable force, joined the Englifh commander at Prefton.

Struck with the fad condition of her affairs, defpairing of a timely and proper fuccour from France, and reminded by ficknefs of her mortality, the queen-dowager

land. retired from Leith to the caſtle of Edinburgh, and put herſelf under the protection of the lord Erſkine. At
73 queen- the period when ſhe was appointed to the regency,
ger the lord Erſkine had received from the three eſtates the
s to charge of this important fortreſs, with the injunction to
burgh hold it till he ſhould know their farther orders; and giving way to the ſolicitations of neither faction, he had kept it with fidelity. By admitting the queen-dowager, he yielded to ſentiments of honour and humanity, and did not mean to depart from his duty. A few only of her domeſtics accompanied her, with the archbiſhop of St Andrew's, the biſhop of Dunkeld, and
74 the earl Mariſchal.

Pro- The confederated nobles now aſſembled at Dalkeith
ts in- to hold a council; and conforming to thoſe maxims
er to of prudence and equity which, upon the eve of hoſtili-
com- ties, had been formerly exerciſed by them, they invited
tion. the queen-dowager to an amicable concluſion of the preſent troubles. In a letter which they wrote to her, they called to her remembrance the frequent manifeſtos and meſſages in which they had preſſed her to diſmiſs the French ſoldiery, who had ſo long oppreſſed the lower ranks of the people, and who threatened to reduce the kingdom itſelf to ſervitude. The averſion, however, with which ſhe had conſtantly received their ſuit and prayers, was ſo great, that they had given way to a ſtrong neceſſity, and had entreated the aſſiſtance of the queen of England to expel theſe ſtrangers by the force of arms. But though they had obtained the powerful protection of this princeſs, they were yet animated with a becoming reſpect for the mother of their ſovereign; and, abhorring to ſtain the ground with Chriſtian blood, were diſpoſed once more to ſolicit the diſmiſſion of theſe mercenaries, with their officers and captains. And that no juſt objection might remain againſt the grant of this their laſt requeſt, they aſſured her, that a ſafe paſſage by land, to the ports of England, ſhould be allowed to the French; or that, if they judged it more agreeable, the navy of Queen Elizabeth ſhould tranſport them to their own country. If theſe propoſals ſhould be rejected, they appealed and proteſted to God and to mankind, that it ſhould be underſtood and believed, that no motive of malice, or hatred, or wickedneſs of any kind, had induced them to employ the fatal expedient of arms and battles; but that they had been compelled to this diſagreeable and diſtreſsful remedy, for the preſervation of their commonwealth, their religion, their perſons, their eſtates, and their poſterity. They begged her to weigh the equity of their petition, to conſider the inconveniences of war, and to think of the reſt and quiet which were neceſſary to relieve the afflictions of her daughter's kingdom; and they beſought her to embalm her own memory, by an immortal deed of wiſdom, humanity, and juſtice.

To give authority and weight to the letter of the aſſociated lords, the lord Grey directed Sir George Howard and Sir James Croft to wait upon the queen-
5 dowager, and to ſtipulate the peaceable departure of the
ll be- Engliſh troops, *upon the condition* that the French
with mercenaries were immediately diſmiſſed from her ſervice,
rity. and prohibited from reſiding in Scotland. Returning no direct anſwer to the applications made to her, ſhe deſired time to deliberate upon the reſolution which it became her to adopt. This equivocal behaviour correſponded with the ſpirit of intrigue which had uniformly Scotland.
diſtinguiſhed the queen-dowager; and it is probable, that her engagements with France did not permit her
to be open and explicit. 576

The combined armies marched towards Leith. A The Fr
body of the French, poſted upon a riſing ground call- defeate
ed *Hawk-hill*, diſputed their progreſs. During five the Pro
hours the conflict was maintained with obſtinate valour. teſtant allies,
At length the Scottiſh horſemen charged the French with a fury which they were unable to reſiſt. They fled to Leith with precipitation; and might have been cut off from it altogether, if the Engliſh cavalry had exerted themſelves. Three hundred of the French ſoldiers periſhed in this action, and a few combatants only fell on the ſide of the Congregation. 577

Leith was inveſted. The pavilions and tents of the who la
Engliſh and Scottiſh nobility were planted at Reſtal- ſiege to
rig, and around it. Trenches were caſt; and the ord- Leith.
nance from the town annoying the combined armies, a mount was raiſed, upon which eight cannons were erected. A continued fire from theſe, againſt St Anthony's tower in South Leith, being kept up and managed with ſkill, the walls of this fabric were ſhaken, and the French found it neceſſary to diſmount their artillery.—Negligent from ſecurity, and apprehenſive of no attack, the Engliſh and Scottiſh officers occupied themſelves in amuſements, and permitted a relaxation of military diſcipline. The French, informed of this ſupineneſs and 578
levity, made a ſally from Leith. While ſome of the A party
captains were diverting themſelves at Edinburgh, and them c
the ſoldiery were engaged at dice and cards, they en- off.
tered the trenches unobſerved, and, puſhing their advantage, put 600 men to the ſword. After this ſlaughter, the Proteſtants were more attentive to their affairs.—Mounts were built at proper diſtances, which, being fortified with ordnance, ſerved as places of retreat and defence in the event of ſudden incurſions; and thus they continued the blockade in a more effectual manner.

The army under the marquis D'Elbeuf, promiſed ſo often to the queen-regent, was in vain expected by her; but ſhe received, at this time, ſupplies in money and military ſtores; and Monluc biſhop of Valence, though defeated in dexterity by Elizabeth and her miniſters, had arrived in Scotland to try anew the arts of 579
delay and negotiation. Conferences were held by him Fruitleſ
with the queen-dowager, with the Engliſh commanders, negotia
and with the confederated nobles; but no contract or with En
agreement could be concluded. His credentials neither land.
extended to the demolition of Leith, nor to the recal of the French mercenaries: and though he obtained powers from his court to conſent to the former of theſe meaſures, they were yet burdened with conditions which were diſgraceful to the Congregation; who, in the preſent proſperous ſtate of their fortunes, were not diſpoſed to give up any of the objects for which they had ſtruggled ſo long, and to the attainment of which they now looked forward with a ſettled hope and expectation.

Though the grave and meaſured orations of Monluc could not overpower the plain and ſtubborn ſenſe of the Congregation, yet as he affected to give them admonitions and warnings, and even ventured to inſult them with menaces, they appear to have conceived a high indignation againſt him. Under this impulſe, and

that

that in ſo advanced a ſtage of their affairs, they might exhibit the determined firmneſs of their reſolutions, and bind to them by an indiſſoluble tie the earl of Huntley and the other perſons who had joined them in conſequence of the Engliſh alliance, they thought of the aſſurance and ſtability of a *new league and covenant*, more ſolemn, expreſſive, and reſolute, than any which they had yet entered into and ſubſcribed.

The nobles, barons, and inferior perſons, who were parties to this bond and aſſociation, bound themſelves in the preſence of Almighty God, as a ſociety, and as individuals, to advance and ſet forward the reformation of religion, and to procure, by every poſſible means, the true preaching of the goſpel, with the proper adminiſtration of the ſacraments, and the other ordinances in connexion with it. Deeply affected, at the ſame time, with the miſconduct of the French ſtateſmen, who had been promoted to high offices; with the oppreſſions of the French mercenaries, whom the queen-dowager kept up and maintained under the colour of authority; with the tyranny of their captains; and with the manifeſt danger of conqueſt to which the country was expoſed, by different fortifications upon the ſea-coaſt, and by other dangerous innovations; they promiſed and engaged, generally and individually, to join with the queen of England's army, and to concur in an honeſt, plain, and unreſerved reſolution to expel all foreigners from the realm, as oppreſſors of public liberty; that by recovering the ancient rights, privileges, and freedom of their nation, they might live for the future under the due obedience of their king and queen, be ruled by the laws and cuſtoms of the country, and by officers and ſtateſmen born and educated among them. It was likewiſe contracted and agreed by the ſubſcribers to this bond and covenant, that no private intelligence by writing or meſſage, or communication of any kind, ſhould be kept up with their adverſaries; and that all perſons who reſiſted the godly enterpriſe in which they were united, ſhould be regarded as their enemies, and reduced to ſubjection and obedience.

When the ſtrong and fervid ſentiment and expreſſion of this new aſſociatinn were communicated to the queen-dowager, ſhe reſigned herſelf to ſorrow. Her mind, inclined to deſpondence by the increaſe of her malady, felt the more intenſely the cruel diſtractions and diſquiets into which the kingdom had been driven by the ambition of France, her own doating affection for the princes of Lorraine, and the vain prognoſtications of flatterers and courtiers. In the agony of paſſion, ſhe beſought the malediction and curſe of God to alight upon all thoſe who had counſelled her to perſecute the preachers, and to refuſe the petitions of the moſt honourable portion of her ſubjects.

In the mean time the ſiege of Leith was proſecuted. But the ſtrength of the garriſon amounting to more than 4000 ſoldiers, the operations of the beſiegers were ſlow and languid. An accidental fire in the town, which deſtroyed many houſes and a great part of the public granary, afforded them an opportunity of playing their artillery with ſome advantage; and a few days after they made a general aſſault. But the ſcaling-ladders which were applied to the walls being too ſhort, and Sir James Croft, who had been gained to the queen-dowager, having acted a treacherous part, the attempt failed of ſucceſs, and 1000 men were deſtroyed. The combined armies, however, did not loſe their reſolution or their hopes. The Engliſh and Scots animated the conſtancy of one another; and in the ratification of the treaty of Berwick, which was now made, a new ſource of cordiality opened itſelf. Letters alſo had come from the duke of Norfolk, promiſing a powerful reinforcement, giving the expectation of his taking upon him the command of the troops in perſon, and ordering his pavilion to be erected in the camp. Leith began to feel the miſery of famine, and the French to give themſelves to deſpair. The beſiegers abounded in every thing; and the arrival of 2000 men, the expected reinforcement from England, gave them the moſt deciſive ſuperiority over their adverſaries. Frequent ſallies were made by the garriſon, and they were always unſucceſsful. Diſcouraged by defeats, depreſſed with the want of proviſions, and languiſhing under the negligence of France, they were ready to ſubmit themſelves to the mercy of the Congregation.

583 A reinforcement arrives from England.

584 Death of the queen regent.

Amidſt this diſtreſs the queen-dowager, waſted with a lingering diſtemper and with grief, expired in the caſtle of Edinburgh. A few days before her death, ſhe invited to her the duke of Chatelherault, the lord James Stuart, and the earls of Argyll, Glencairn, and Mariſchal, to bid them a laſt adieu. She expreſſed to them her ſorrow for the troubles of Scotland, and made it her earneſt ſuit, that they would conſult their conſtitutional liberties, by diſmiſſing the French and Engliſh from their country; and that they would preſerve a dutiful obedience to the queen their ſovereign. She profeſſed an unlimited forgiveneſs of all the injuries which had been done to her; and entreated their pardon for the offences ſhe had committed againſt them. In token of her kindneſs and charity, ſhe then embraced them by turns; and, while the tear ſtarted in her eye, preſented to them a cheerful and ſmiling aſpect. After this interview, the ſhort portion of life which remained to her was dedicated to religion; and that ſhe might allure the Congregation to be compaſſionate to her Popiſh ſubjects and her French adherents, ſhe flattered them, by calling John Willocks, one of the moſt popular of their preachers, to aſſiſt and comfort her by his exhortations and prayers. He made long diſcourſes to her about the abominations of the maſs; but ſhe appears to have died in the communion of the Romiſh church; and her body being tranſported to France, was depoſited in the monaſtery of St Peter, at Rheims, in Champagne, where her ſiſter Renée was an abbeſs.

585 The French troops submit.

The death of the queen-dowager, at a period ſo critical, broke altogether the ſpirit of the French troops. They were blocked up ſo completely, that it was almoſt impoſſible for any ſupplies to reach them either by ſea or land; and France had delayed ſo long to fulfil its magnificent promiſes, that it was no longer in a capacity to take any ſteps towards their accompliſhment. Its internal diſtreſs and diſquiets were multiplying. The nobility, impoveriſhed by wars, were courting the rewards of ſervice, and ſtruggling in hoſtility. The clergy were avaricious, ignorant, and vindictive. The populace, knowing no trade but arms, offered their ſwords to the factious. Francis II. the huſband of Mary, was without dignity or underſtanding. Catharine de Medicis his mother was full of artifice and falſehood. Inſurrections were dreaded in every province.

cotland. vince. The houſe of Guiſe was encompaſſed with difficulties, and trembling with apprehenſions, ſo that they could not think of perſiſting in their views of diſtant conqueſts. It was neceſſary that they ſhould abandon for a time all the proud projects they had formed for the extenſion of the French monarchy. It was chiefly in the exemption from foreign wars that they could hope to ſupport their own greatneſs, and apply a remedy to the domeſtic diſturbances of France.

586 ncis and ry enter o a ne- iation h Eliza- ;

It appeared to Francis and Mary, that they could not treat in a direct method with the Congregation, whom they affected to conſider as rebellious ſubjects, without derogating from their royal dignity. In negotiating a peace, they therefore addreſſed themſelves to Queen Elizabeth. It was by her offices and interference that they projected a reconciliation with the confederated lords, and that they meant to extinguiſh the animoſities which, with ſo much violence, had agitated the Scottiſh nation. They granted their commiſſion to John Monluc biſhop of Valence, Nicholas Pelleve biſhop of Amiens, Jacques de la Broſſe, Henry Clentin ſieur d'Oyſel, and Charles de la Rocheſaoeault ſieur de Randan; authorizing them in a body, or by two of their number, to enter into accords and agreements with the queen of England. The Engliſh commiſſioners were Sir William Cecil principal ſecretary of ſtate, Nicolas Wottno dean of Canterbury and York, Sir Ralph Sadler, Sir Henry Percy, and Sir Peter Crew; and the powers of treaty were to be exerciſed by them all in conjunction, or by four, three, or two of them.

587 uſe an mnity he Pro- ants;

The plenipotentiaries of France, though empowered only to treat with England, were yet, by a ſeparate commiſſion, intruſted to aſſure the Congregation, that, notwithſtanding the heinous guilt incurred by them, Francis and Mary were inclined to receive them into favour, upon their repentance and return to obedience; and to abſtain for ever from all inquiry into their conduct. They had full authority, at the ſame time, by this new deed, to hear, in conjunction with the commiſſioners of Elizabeth, the complaints of the Congregation, and to grant, with their conſent, the relief which appeared to them to be the moſt proper and ſalutary.

The nobility and people of Scotland, chooſing for their repreſentatives the lord James Stuart, the lord Ruthven, and Maitland of Lethington, expreſſed their willingneſs to concur in reaſonable meaſures for the re-eſtabliſhment of the public union and tranquillity. By the mode of a formal petition, they enumerated their

588 d at laſt ant their ation.

grievances, laid claim to a redreſs of them, and beſought an uniform protection to their conſtitution and laws. To this petition the interceſſion of Queen Elizabeth effected the friendly attentinn of Francis and Mary; and upon a foundation concerted with ſo much propriety, Monluc and Randan, Cecil and Wotton, the acting plenipotentiaries of England and France, drew up and authenticated the celebrated deed of relief and conceſſion which does ſo much honour to the ſpirit, perſeverance, and magnanimity of the Scottiſh nation.

589 ture of ir treaty th the oteſtants.

By this accord and agreement, Francis and Mary ſtipulated and conſented, that no French ſoldiers and no foreign troops ſhould ever be introduced into Scotland without the counſel and advice of the three eſtates. They concurred in the opinion, that the French mercenaries ſhould be ſent back into France, and that the fortifications of Leith ſhould be demoliſhed. They agreed that commiſſioners ſhould be appointed to viſit Dunbar, and to point out the works there which ought to be deſtroyed; and they bound and engaged themſelves to build no new fortreſs or place of ſtrength within the kingdom, and to repair no old one, without a parliamentary authority and ſanction. They conſented to extinguiſh all debts which had been contracted for the maintenance of the French and Scotch ſoldiery in their ſervice. They appointed the eſtates of the realm to hold a parliament for the diſcuſſion of affairs of ſtate; and they obliged themſelves to conſider the acts of this aſſembly as valid and effectual in every reſpect. They confirmed the ancient law of the country, which prohibited the princes of Scotland from making peace and war without the advice of the three eſtates. It was accorded and agreed by them, that the three eſtates, in concurrence with the queen, ſhould elect a council for the adminiſtration of affairs during her majeſty's abſence. They became bound to employ the natives of Scotland in the management of juſtice both civil and criminal, in the offices of chancellor, keeper of the ſeals, treaſurer, comptroller, and in other ſtations of a ſimilar nature; and to abſtain from the promotion of all foreigners to places of truſt and honour, and from inveſting any clergyman in the charge of affairs of the revenue. They determined to eſtabliſh an act of oblivion, and to forget and bury for ever the memory of all the late tranſactions of war and offence. It was concluded by them, that a general peace and reconciliation ſhould take place among all parties. They expreſſed their determination, that no pretence ſhould be aſſumed by them, from the late contentions, to deprive any of their ſubjects of their eſtates or offices. And they referred the reparation which might be proper to compenſate the injuries that had been ſuſtained by biſhops and eccleſiaſtics, to the judgment of the three eſtates in parliament.

Upon the ſubject of the Reformation, the plenipotentiaries of England and France did not chooſe to deliberate and decide, although articles with regard to it had been preſented to them by the nobles and the people. They referred this delicate topic to the enſuing meeting of the parliament; and the leaders of the Congregation engaged, that deputies from the three eſtates ſhould repair to the king and queen, to know their intention concerning matters of ſuch high importance.

After having granted theſe conceſſions to the nobility and the people of Scotland, upon the part of their reſpective courts, Monluc and Randan, Cecil and Wotton, concluded another deed of treaty and agreement. By this convention it was determined, that the Engliſh and French troops ſhould depart out of Scotland; that all warlike preparations ſhould ceaſe; that the fort of Eymouth ſhould be razed to the ground, in terms of the treaty of Cambray; that Francis and Mary ſhould abſtain from bearing the title and arms of England or Ireland; that it ſhould be conſidered, whether a farther compenſation ſhould be made to Elizabeth for the injuries committed againſt her; and that the king and queen of Scots ſhould be fully and ſincerely reconciled to the nobility and the people of their kingdom. The intereſts of England and France were the particular objects of this agreement. But though the conceſſions to the Proteſtants were not inſerted in it at full length, an expreſſive

5 Artic lating the F troops

expressive reference was made to them; and they received a confirmation in terms which could not be misunderstood, or controverted. This deed recorded the clemency of Francis and Mary to their subjects of Scotland, the extreme willingness of the nobility and the people to return to their duty and allegiance, the representation they had offered of their grievances, and the request of Queen Elizabeth that redress should be afforded to them; and it appealed to the consequent concessions which had been stipulated to their advantage.

By these important negotiations, the Protestants, while they humbled France, flattered Queen Elizabeth; and while they acquired a power to act in the establishment of the Reformation, restored its civil constitution to Scotland. The exclusion of foreigners from offices of state, the limitation of the Scottish princes with regard to peace and war, the advancement of the three estates to their ancient consequence, and the act of oblivion of all offences, were acquisitions most extensively great and useful; and, while they gave the fullest security to the reformed, gratified their most sanguine expectations.

1 ... proclaimed.

The peace, so fortunately concluded, was immediately proclaimed. The French mercenaries embarked for their own country, and the English army took the road to Berwick. Amidst events so joyful, the preachers exhorted the confederated nobles to command the solemnity of a thanksgiving. It was ordered accordingly; and after its celebration, the commissioners of the boroughs, with several of the nobility, and the tenants *in capite*, were appointed to choose and depute ministers to preach the gospel in the principal towns throughout the kingdom. John Knox was called to discharge the pastoral functions at Edinburgh, Christopher Goodman at St Andrew's, Adam Heriot at Aberdeen, John Row at Perth, Paul Methven at Jedburgh, William Christison at Dundee, David Ferguson at Dunfermline, and David Lindsay at Leith. That the business of the church, at the same time, might be managed with propriety, superintendants were elected to preside over the ecclesiastical affairs of particular provinces and districts. Mr John Spotswood was named the superintendant for the division of Lothian, Mr John Willocks for that of Glasgow, Mr John Winram for that of Fife, Mr John Erskine of Dun for that of Angus and Mearns, and Mr John Carsewell for that of Argyll and the Isles. This inconsiderable number of ministers and superintendants gave a beginning to the reformed church of Scotland.

93 ...parliament meets

Amidst the triumph and exultation of the Protestants, the meeting of the parliament approached. All persons who had a title from law, or from ancient custom, to attend the great council of the nation, were called to assemble there. While there was a full convention of the greater barons and the prelates, the inferior tenants *in capite*, or the lesser barons, upon an occasion so great, instead of appearing by representation, came in crowds to give personally their assistance and votes; and all the commissioners for the boroughs, without exception, presented themselves.

It was objected to this parliament when it was assembled, that it could not be valid, since Francis and Mary were not present, and had not empowered any person to represent them. But by the terms of the late concessions to the nobility and the people, they had in effect dispensed with this formality; and the objection, after having been agitated with heat for some days, was rejected by a majority of voices. The lords of the articles were then chosen; and as the Protestant party was superior to the Popish faction, they were careful in electing the members of this committee, to favour all those who were disposed to forward the work of the Reformation. The first object which the lords of the articles held out to the parliament was the supplication of the nobility, gentry, and all the other persons who professed the new doctrines. It required, that the Romish church should be condemned and abolished. It reprobated the tenet of transubstantiation, the merit of works, papistical indulgences, purgatory, pilgrimages, and prayers to departed saints; and considering them as pestilent errors, and as fatal to salvation, it demanded, that all those who should teach and maintain them should be exposed to correction and punishment. It demanded, that a remedy should be applied against the profanation of the holy sacraments by the Roman Catholics; and that the ancient discipline of the church should be restored. In fine, it insisted, that the supremacy and authority of the pope should be abolished; and that the patrimony of the church should be employed in supporting the reformed ministry, in the provision of schools, and in the maintenance of the poor.

59 Supplication of Protest...

This supplication of the Protestants was received in parliament with marks of the greatest deference and respect. The Popish doctrines it censured, and the strong language it employed, excited no dispute or altercation. The nobility, however, and the lay-members, did not think it expedient that the patrimony of the church, in all its extent, should be allotted to the reformed ministry, and the support of schools and the poor. Avoiding, therefore, any explicit scrutiny into this point, the parliament gave it in charge to the ministers and the leading men of the Reformation, to draw up, under distinct heads, the substance and sense of those doctrines which ought to be established over the kingdom. Within four days this important business was accomplished. The writing or instrument to which the reformed committed their opinions was termed, "The Confession of Faith, professed and believed by the Protestants within the realm of Scotland (q)." It was read first to the lords of the articles. It was then read to the parliament; and the prelates of the Romish church were commanded, in the name of God, to make publicly their objections to the doctrines it proposed. They preserved a profound silence. A new diet was appointed for concluding the transaction. The articles of the Confession were again read over in their order, and the votes of the parliament were called. Of the temporal nobility, three only refused to bestow upon it their authority. The earl of Athol, and the lords Somerville and Bothwell, protested,

5... A Confession o... drawn

otland.

ed, that "they would believe as their fathers had done before them." The bishops and the estate ecclesiastical, from a consciousness of the weakness of Popery, seemed to have lost all power of speech. No dissent, no vote, was given by them. "It is long (said the earl Marischal), since I entertained a jealousy of the Romish faith, and an affection to the reformed doctrines. But this day has afforded me the completest conviction of the falsehood of the one, and the truth of the other. The bishops, who do not conceive themselves to be deficient in learning, and whose zeal for the maintenance of the hierarchy cannot be doubted, have abandoned their religion, and their interest in it, as objects which admit of no defence or justification." All the other constituent members of this great council were zealous for the establishment of the Reformation, and affirmed the propriety of its doctrines. Thus the high court of parliament, with great deliberation and solemnity, examined, voted, and ratified the confession of the reformed faith.

596 olition ne mass.

A few days after the establishment of the Confession of Faith, the parliament passed an act against the mass and the exercise of the Romish worship. And it scrupled not to ordain, that all persons saying or hearing mass should, for the first offence, be exposed to the confiscation of their estates, and to a corporal chastisement, at the discretion of the magistrate; that for the second offence, they should be banished out of the kingdom; and that for the third offence they should incur and suffer the pains of death. This fierceness, it is to be acknowledged, did not suit the generosity of victory; and while an excuse is sought for it in the perfidiousness of the Romish priesthood, it escapes not the observation of the most superficial historians, that these severities were exactly those of which the Protestants had complained so loudly, and with so much justice. By another ordination, the parliament, after having declared, that the pope, or bishop of Rome, had inflicted a deep wound and a humiliating injury upon the sovereignty and government of Scotland, by his frequent interferences and claims of power, commanded and decreed, that, for the future, his jurisdiction and authority should be dead and extinct; and that all persons maintaining the smallest connexion with him, or with his sect, should be liable to the loss of honour and offices, proscription, and banishment.

597 secuting t of the testants.

These memorable and decisive statutes produced the overthrow of the Romish religion. To obtain to these proceedings, and to its other ordinances, the approbation of Francis and Mary was an object of the greatest anxiety, and of infinite moment to the three estates. Sir James Sandilands lord St John was therefore appointed to go to France, and to express to the king and queen the affection and allegiance of their subjects, to explain what had been done in consequence of the late concessions and treaty, and to solicit their royal ratification of the transactions of the parliament. The spirited behaviour of the Congregation had, however, exceeded all the expectations of the princes of Lorraine; and the business of the embassy, and the ambassador himself, though a man of character and probity, were treated not only with ridicule, but with insult and contumely. He returned accordingly without any answer to his commission. Instead of submitting the heads

598 ncis and ry refuse confirm acts of s parliament.

and topics of a reformation to Francis and Mary, by a petition or a narrative, the parliament had voted them into laws; and from this informality the validity of its proceedings has been suspected. But it is observable of the Protestants, that they had not concealed their views with regard to religion and the abolition of Popery; that in the grant of redress and concession, and in the deed of treaty, no actual prohibition was made to bar the establishment of the Reformation; that a general authority was given to the parliament to decide in affairs of state; and that Francis and Mary were solemnly bound to authenticate its transactions. Though a formality was invaded, the spirit of the treaties was yet respected and maintained. The nation, of consequence, imputed the conduct of Francis and Mary to political reasons suggested by the princes of Lorraine, and to the artifices of the Popish clergy; and as Elizabeth did not refuse, upon her part, the ratification of the agreements, and solicited and pressed the French court in vain to adopt the same measure, a strength and force were thence communicated to this conclusion.

Sco

When the three estates despatched Sir James Sandilands to France, they instructed the earls of Morton and Glencairn, with Maitland of Lethington, to repair to the court of England. By these ambassadors they presented to Elizabeth their sincere and respectful thanks, for the attention shown by her to Scotland, in her late most important services. And while they solicited the continuance of her favour and protection, entreated, in an earnest manner, that her majesty, for the establishment of a perpetual peace and amity, would be pleased to take in marriage the earl of Arran, the next heir after his father to the Scottish monarchy. The queen made new and fervent protestations of her regard and attachment; and gave the promise of her warmest aid when it should be necessary, in their just defence, upon any future occasion. She spoke in obliging terms of the earl of Arran; but as she found in herself no present disposition to marriage, she desired that he might consult his happiness in another alliance. She expressed a favourable opinion of the Scottish nobility; and as a demonstration of her affection and esteem, she took the liberty to remind them of the practices which had been employed to overturn their independency, and begged them to consider the unanimity and concord of their order as a necessary guard against the ambition and the artifice of the enemies of their nation.

The success of the Congregation, though great and illustrious, was not yet completely decisive. The refusal of Francis and Mary to ratify their proceedings opened a source of bitterness and inquietude. The Popish party, though humbled, was not annihilated. Under the royal protection it would soon be formidable. Political considerations might arise, not only to cool the amity of England, but even to provoke its resentment. And France, though it could now transport no army against Scotland, might soon be able to adopt that expedient. Cruel distractions and severe calamities were still to be dreaded. In the narrowness of their own resources they could find no solid and permanent security against the rage and weight of domestic faction, and the strenuous exertions of an extensive kingdom. All these fair achievements might

be

and. be blasted and overthrown. Popery might again build up her towers, and a sanguinary domination destroy alike their religious and civil liberties.

99 of is II.

While the anguish of melancholy apprehensions repressed the triumph of the Congregation, the event which could operate most to their interests was announced to them. This event was the death of Francis II. The tie which knit Scotland to France was thus broken. A new scene of politics displays itself. Catharine de Medicis, the queen-mother, ruled Charles IX. and was the personal enemy of the queen of Scots. The power and the credit which Mary had lent to her uncles, and the frequent and humiliating disappointments which the queen-mother had suffered from her influence over Francis, were now repaid with a studied indifference and neglect. In the full perfection of her charms, with two crowns upon her head, and looking towards a third, she felt herself to be without grandeur and without consequence. Leaving a court where she had experienced all the enjoyments of which humanity is susceptible, she retired to Rheims, to indulge her sorrow.

00 fiasti- overn- of and mo- d.

In the humiliation of their queen, and in the change produced in the councils of France, the Protestants of Scotland found every possible encouragement to proceed with vigour in the full establishment of the reformed doctrines. After the dissolving of the parliament, they turned their thoughts and attention to the plan of policy which might suit best the tenets and religion for which they had contended. The three estates, amidst their other transactions, had granted a commission to Mr John Winram, Mr John Spottiswood, John Willocks, Mr John Douglas, Mr John Row, and John Knox, to frame and model a scheme or platform of ecclesiastical government. They were not long in complying with an order so agreeable to them, and composed what is termed the *First Book of Discipline*; in which they explained the uniformity and method which ought to be preserved concerning doctrine, the administration of the sacraments, the election and provision of ministers, and the policy of the church.

101 reve- of the nt ch re- to the med thers.

A convention of the estates gave its sanction to the Presbyterian scheme of government. But while the Book of Discipline sketched out a policy beautiful for its simplicity, yet it required that the patrimony and the rich possessions of the ancient church should be allotted to the new establishment. The reformers, however, so successful in the doctrines and the policy they had proposed, were here very unfortunate. This convention of the estates did not pay a more respectful regard to this proposal than the celebrated parliament had done, which demolished the mass and the jurisdiction of the see of Rome. They affected to consider it as no better than a dream. The expression "a devout imagination" was applied to it in mockery; and it was not till after long and painful struggles, that the new establishment was able to procure to itself a becoming and necessary provision and support. The Romish clergy were strenuous to continue in their possessions, and to profit by them; and the nobles and the laity having seized upon great proportions of the property of the church, were no less anxious to retain the acquisitions they had made.

The aversion entertained from bestowing riches upon the Presbyterian establishment, encouraged the ardour which prevailed for advancing all the other views and interests of the reformed. And this end was also promoted in no inconsiderable degree by the insidious policy of Catharine de Medicis. She was willing to increase and to foster all the difficulties and dangers in the situation of the queen of Scots and her subjects. Upon this account she had engaged Charles IX. to dispatch Monsieur Noailles to the Scotch parliament, to urge it in strong terms to renew the ancient league between the two kingdoms, to dissolve the alliance with England, and to re-establish over Scotland the Popish doctrines and the Popish clergy. A new meeting of the estates was assembled, which considered these strange requisitions, and treated them with the indignation they merited. Monsieur Noailles was instructed to inform his sovereign, that France having acted with cruelty and perfidiousness towards the Scots, by attacking their independency and liberties under the cover and pretence of amity and marriage, did not deserve to know them any longer as an ally; that principles of justice, a love of probity, and a high sense of gratitude, did not permit the Scottish parliament to break the confederacy with England, which had generously protected their country against the tyrannical views of the French court, and the treacherous machinations of the house of Guise; and that they were never to acknowledge the Popish clergy to be a distinct order of men, or the legal possessors of the patrimony of the church; since, having abolished the power of the pope, and renounced his doctrines, they could bestow no favour or countenance upon his vassals and servants.

To this council of the estates a new supplication was presented by the Protestants. They departed from the high claim which they had made for the riches and patrimony of the Popish church; and it was only requested by them, that a reasonable or decent provision should be allotted to the true preachers of the gospel. This application, however, no less than their former exorbitant demand, was treated with neglect and indifference. But amidst the anxiety manifested by the nobles and the tenants of the crown to hold the Presbyterian clergy in subjection and in poverty, they discovered the warmest zeal for the extension and continuance of the reformed opinions. For in this supplication of the Protestants, an ardent desire being intimated and urged, that all the monuments of idolatry which remained should be utterly destroyed, the fullest and most unbounded approbation was given to it. An act accordingly was passed, which commanded that every abbey-church, every cloister, and every memorial whatsoever of Popery, should be finally overthrown and demolished: and the care of this cruel, but popular employment, was committed to those persons who were most remarkable for their keenness and ardour in the work of the Reformation. Its execution in the western counties was given in charge to the earls of Arran, Argyll, and Glencairn; the lord James Stuart attended to it in the more northern districts; and in the inland divisions of the country, it was intrusted to the barons in whom the Congregation had the greatest confidence. A dreadful devastation ensued. The populace, armed with authority, spread their ravages over the kingdom. It was deemed an execrable lenity to spare any fabric or place where idolatry had been exercised.

Scotla C Final struct monas ries an every of the pish re gion i Scotla

cised. The churches and religious houses were everywhere defaced, or pulled to the ground; and their furniture, utensils, and decorations, became the prizes and the property of the invader. Even the sepulchres of the dead were ransacked and violated. The libraries of the ecclesiastics, and the registers kept by them of their own transactions and of civil affairs, were gathered into heaps, and committed to the flames. Religious antipathy, the sanction of law, the exhortation of the clergy, the hope of spoil, and, above all, the ardour to put the last hand to the Reformation, concurred to drive the rage of the people to its wildest fury; and in the midst of havock and calamity, the new establishment surveyed its importance and its power.

The death of Francis II. having left his queen, Mary, in a very disagreeable situation while she remained in France, it now became necessary for her to think on returning to her own country. To this she was solicited both by the Protestants and Papists; the former, that they might gain her over to their party; and the latter, hoping that, as Mary was of their own persuasion, Popery might once more be established in Scotland. For this deputation, the Protestants chose Lord James Stuart, natural brother to the queen; and the Papists, John Lesly, official and vicar-general of the diocese of Aberdeen. The latter got the start of the Protestant ambassador, and thus had the opportunity of first delivering his message. He advised her strongly to beware of the lord James Stuart, whom he represented as a man of unbounded ambition, who had espoused the Protestant cause for no other reason than that he might advance himself to the highest employments in the state; nay, that he had already fixed his mind on the crown itself. For these reasons he advised that the lord James Stuart should be confined in France till the government of Scotland could be completely established. But if the queen was averse to this measure, he advised her to land in some of the northern districts of Scotland, where her friends were most numerous; in which case an army of 20,000 men would accompany her to Edinburgh, to restore the Popish religion, and to overawe her enemies. The next day the lord James Stuart waited upon her, and gave an advice very different from that of Lesly. The surest method of preventing insurrections, he said, was the establishment of the Protestant religion; that a standing army and foreign troops would certainly lose the affections of her subjects; for which reason he advised her to visit Scotland without guards and without soldiers, and he became solemnly bound to secure their obedience to her. To this advice Mary, though she distrusted its author, listened with attention; and Lord James, imagining that she was prejudiced in his favour, took care to improve the favourable opportunity; by which means he obtained a promise of the earldom of Marr.

Before Mary set out from France, she received an embassy from Queen Elizabeth, pressing her to ratify the treaty of Edinburgh, in which she had taken care to get a clause inserted, that Francis and Mary should *for ever* abstain from assuming the title and arms of England and Ireland. But this was declined by the queen of Scotland, who, in her conference with the English ambassador, gave an eminent proof of her political abilities †. Her refusal greatly augmented the jealousies which already prevailed between her and Elizabeth; insomuch that the latter refused her a safe passage through her dominions into Scotland. This was considered by Mary as a high indignity; she returned a very spirited answer, informing her rival, that she could return to her own dominions without any assistance from her, or indeed whether she would or not. In the month of August 1561, Mary set sail from Calais for Scotland. She left France with much regret; and at night ordered her couch to be brought upon deck, desiring the pilot to awaken her in the morning if the coast of France should be in view. The night proved calm, so that the queen had an opportunity once more of indulging herself with a sight of that beloved country. A favourable wind now sprung up, and a thick fog coming on, she escaped a squadron of men of war which Elizabeth had sent out to intercept her; and on the 20th of the month she landed safely at Leith.

But though the Scots received their queen with the greatest demonstrations of joy, it was not long before an irreconcileable quarrel began to take place. The Protestant religion was now established all over the kingdom; and its professors had so far deviated from their own principles, or what ought to have been their principles, that they would grant no toleration to the opposite party, not even to the sovereign herself. In consequence of this, when the queen attempted to celebrate mass in her own chapel of Holyroodhouse, a violent mob assembled, and it was with the utmost difficulty that the lord James Stuart and some other persons of high distinction could appease the tumult. Mary attempted to allay these ferments by a proclamation, in which she promised to take the advice of the states in religious matters; and, in the mean time, declared it to be death for any person to attempt an innovation or alteration of the religion which she found generally established upon her arrival in Scotland. Against this proclamation the earl of Arran protested, and formally told the herald, the queen's proclamation should not protect her attendants and servants if they presumed to commit idolatry and to say mass. John Knox declared from the pulpit, that one mass was more terrible to him than if 10,000 armed enemies had landed in any part of the kingdom to re-establish Popery. The preachers everywhere declaimed against idolatry and the mass; keeping up, by their mistaken zeal, a spirit of discontent and sedition throughout the whole kingdom. John Knox was called before the queen to answer for the freedom of his speeches; but his unbounded boldness, when there, gave Mary much disquiet, as not knowing in what manner to deal with him. The freedoms, however, which were taken with the queen, could not induce her to depart from that plan of government which she had laid down in France. To the Protestants she resolved to pay the greatest attention; from among them she chose her privy council, and heaped favours upon the lord James Stuart, who for his activity in promoting the Reformation was the most popular man in the kingdom; while to her courtiers of the Roman Catholic persuasion she behaved with a distant formality.

In the mean time, the difference between the two rival queens became every day greater. The queen of Scotland pressed Elizabeth to declare her the nearest heir

heir to the crown of England; and Elizabeth pressed Mary to confirm the treaty of Edinburgh. With this the latter could not comply, as it would in fact have been renouncing for ever the title to that crown for which she was so earnestly contending. Endless negotiations were the consequence, and the hatred of Elizabeth to Mary continually increased. This year the queen of Scotland amused herself by making a circuit through part of her dominions. From Edinburgh she proceeded to Stirling; from thence to Perth, Dundee and St Andrew's. Though received everywhere with the greatest acclamations and marks of affection, she could not but remark the rooted aversion which had universally taken place against Popery; and upon her return to Edinburgh, her attention was called to an exertion of this zeal, which may be considered as highly characteristic of the times. The magistrates of this city after their election, enacted rules, according to custom, for the government of their borough. By one of these acts, which they published by proclamation, they commanded all monks, friars, and priests, together with all adulterers and fornicators, to depart from the town and its limits within 24 hours, under the pains of correction and punishment. Mary, justly interpreting this exertion of power to be an usurpation of the royal authority, and a violation of order, displaced the magistrates, commanded the citizens to elect others in their room, and granted by proclamation a plenary indulgence to all her subjects not convicted of any crime, to repair to and remain in her capital at their pleasure.

Besides these disturbances on account of religion, the kingdom was now in confusion on another account. The long continuance of civil wars had left a proneness to tumults and insurrections everywhere; and thefts, rapine, and licentiousness of every kind, threatened to subvert the foundations of civil society. Mary made considerable preparations for the suppression of these disorders, and appointed the lord James Stuart her chief justiciar and lieutenant. He was to hold two criminal courts, the one at Jedburgh, and the other at Dumfries. To assist his operations against the banditti, who were armed, and often associated into bodies, a military force was necessary; but as there were at present neither standing army nor regular troops in the kingdom, the county of Edinburgh, and ten others were commanded to have their strength in readiness to assist him. The feodal tenants, and the allodial or free proprietors of these districts, in complete armour, and with provisions for 20 days, were appointed to be subservient to the purposes of his commission, and to obey his orders in establishing the public tranquillity. In this expedition he was attended with his usual success. He destroyed many of the strong holds of the banditti; hanged 20 of the most notorious offenders, and ordered 50 more to be carried to Edinburgh, there to suffer the penalties of law on account of their rebellious behaviour. He entered into terms with the lord Grey and Sir John Foster, the wardens of the English borders, for the mutual benefit of the two nations; and he commanded the chiefs of the disorderly clans to submit to the queen, and to obey her orders with regard to the securing of the peace, and preventing insurrections and depredations for the future.

In the mean time the queen was in a very disagreeable situation, being suspected and distrusted by both parties. From the concessions she had made to the Protestants, the Papists supposed that she had a design of renouncing their religion altogether; while, on the other hand, the Protestants could scarcely allow themselves to believe that they owed any allegiance to an idolater. Disquiets of another kind also now took place. The duke of Chatelherault, having left the Catholics to join the opposite party, was neglected by his sovereign. Being afraid of some danger to himself, he fortified the castle of Dumbarton, which he resolved to defend; and in case of necessity to put himself under the protection of the queen of England.—The earl of Arran was a man of very slender abilities, but of boundless ambition. The queen's beauty had made an impression on his heart, and his ambition made him fancy himself the fittest person in the kingdom for her husband. But his fanaticism, and the violence with which he had opposed the mass, disgusted her. He bore her dislike with an uneasiness that preyed upon his intellects and disordered them. It was even supposed that he had concerted a scheme to possess himself of her person by armed retainers: and the lords of her court were commanded to be in readiness to defeat any project of this sort. The earl of Bothwel was distinguished chiefly by his prodigalities and the licentiousness of his manners. The earl of Marischal had every thing that was honourable in his intentions, but was overwary and slow. The earl of Morton possessed penetration and ability, but was attached to no party or measures from any principles of rectitude: His own advantage and interest were the motives which governed him. The earl of Huntley the lord chancellor, was unquiet, variable, and vindictive: His passions, now fermenting with violence, were soon to break forth in the most dangerous practices. The earls of Glencairn and Menteith were deeply tinctured with fanaticism; and their inordinate zeal for the new opinions, not less than their poverty, recommended them to Queen Elizabeth. Her ambassador Randolph, advised her to secure their service, by addressing herself to their necessities. Among courtiers of this description, it was difficult for Mary to make a selection of ministers in whom to confide. The consequence and popularity of the lord James Stuart, and of Maitland of Lethington, had early pointed them out to this distinction; and hitherto they had acted to her satisfaction. They were each of eminent capacity: but the former was suspected of aiming at the sovereignty; the latter was prone to refinement and duplicity; and both were more connected with Elizabeth than became them as the ministers and subjects of another sovereign.

Beside the policy of employing and trusting statesmen who were Protestants, and the precaution of maintaining a firm peace with England, Mary had it also at heart to enrich the crown with the revenues of the ancient church. A convention of estates was assembled to deliberate upon this measure. The bishops were alarmed with their perilous situation. It was made known to them, that the charge of the queen's household required an augmentation; and that as the rents of the church had flowed chiefly from the crown, it was expedient that a proper proportion of them should now be resumed to uphold its splendour. After long consultations, the prelates and estate ecclesiastical, consider-

ing that they existed merely by the favour of the queen, consented to resign to her the third part of their benefices, to be managed at her pleasure; with the reservation that they should be secured during their lives against all farther payments, and relieved from the burden of contributing to the maintenance of the reformed clergy. With this offer the queen and the convention of estates were satisfied. Rentals, accordingly, of all their benefices throughout the kingdom, were ordered to be produced by the ancient ecclesiastics; the reformed ministers, superintendants, elders, and deacons, were enjoined to make out registers of the grants or provisions necessary to support their establishment; and a supereminent power of judging in these matters was committed to the queen and the privy-council.

While the prelates and estate ecclesiastical submitted to this offer from the necessity of their affairs, it was by no means acceptable to the reformed clergy, who at this time were holding an assembly. It was their earnest wish to effect the entire destruction of the ancient establishment, to succeed to a large proportion of their emoluments, and to be altogether independent of the crown. But while the Protestant preachers were naturally and unanimously of these sentiments, the nobles and gentlemen who had promoted the Reformation were disposed to think very differently. To give too much of the wealth of the church to the reformed clergy, was to invest them with a dangerous power. To give too great a proportion of it to the crown, was a step still more dangerous. At the same time it was equitable, that the ancient clergy should be maintained during their lives; and it consisted with the private interest of the noblemen and gentlemen, who had figured during the Reformation, not to consent to any scheme that would deprive them of the spoils of which they had already possessed themselves out of the ruins of the church, or which they might still be enabled to acquire.

613 Success of the demands of Protestants.

Thus public as well as private considerations contributed to separate and divide the lay Protestants and the preachers. The general assembly, therefore, of the church, was not by any means successful in the views which had called them together at this time, and which they submitted to the convention of estates. Doubts were entertained whether the church had any title to assemble itself. The petition preferred for the complete abolition of idolatry, or for the utter prohibition of the mass, was rejected, notwithstanding all the zeal manifested by the brethren. The request that Mary should give authority to the book of discipline, was not only refused, but even treated with ridicule. The only point pressed by the church, which attracted any notice, was its requisition of a provision or a maintenance; but the measure invented for this end was in opposition to all its warmest desires.

This measure, however, so unpromising to the preachers in expectation, was found to be still more unsatisfactory upon trial. The wealth of the Romish church had been immense, but great invasions had been made upon it. The fears of the ecclesiastics, upon the overthrow of Popery, induced them to engage in fraudulent transactions with their kinsmen and relations; in consequence of which many possessions were conveyed from the church into private hands. For valuable considerations, leases of church-lands, to endure for many years, or in perpetuity, were granted to strangers and adventurers. Sales also of ecclesiastical property, to a great extent, had been made by the ancient incumbents; and a validity was supposed to be given to these transactions by confirmations from the pope, who was zealous to assist his votaries. Even the crown itself had contributed to make improper dispositions of the ecclesiastical revenues. Laymen had been presented to bishoprics and church-livings, with the power of disposing of the territory in connexion with them. In this diffusion of the property of the church, many fair acquisitions, and much extensive domain, came to be invested in the nobles and the gentry.

From these causes the grant of the third of their benefices, made by the ancient ecclesiastics to the queen, with the burden of maintaining the reformed clergy, was not near so considerable as might have been expected. But the direction of the scheme being lodged in the queen and the privy-council, the advantage to the crown was still greater than that bestowed upon the preachers. Yet the carrying the project into execution was not without its inconveniences. There were still many opportunities for artifice and corruption; and the full third of the ecclesiastical benefices even after all the previous abstractions of them which had been made, could not be levied by any diligence. For the ecclesiastics often produced false rentals of their benefices; and the collectors for the crown were not always faithful to the trust reposed in them. The complete produce of the thirds did not amount to a great sum; and it was to operate to the expences of the queen, as well as to the support of the preachers. A scanty proportion went to the latter; and yet the persons who were chosen to fix and ascertain their particular stipends or provisions were the fast friends of the Reformation. For this business was committed in charge to the earls of Argyll and Morton, the lord James Stuart, and Maitland of Lethington, with James Macgill the clerk-register, and Sir John Ballenden the justice-clerk. One hundred Scots merks were deemed sufficient for a common minister. To the clergymen of greater interest or consideration, or who exercised their functions in more extensive parishes, 300 merks were allotted; and, excepting to superintendants, this sum was seldom exceeded. To the earl of Argyll, to the lord James Stuart, to Lord Erskine, who had large ecclesiastical revenues, their thirds were usually remitted by the queen; and upon the establishment of this fund or revenue, she also granted many pensions to persons about her court and of her household.

6.. Provision made for the Protestant preachers.

The complaints of the preachers were made with little decency, and did not contribute to better their condition. The coldness of the Protestant laity, and the humanity shown to the ancient clergy, were deep wounds both to their pride and to their interests. To a mean spirit of flattery to the reigning power, they imputed the defection of their friends; and against the queen they were animated with the bitterest animosity. The poverty in which they were suffered to remain inflamed all their passions. They industriously sought to indulge their rancour and turbulence; and inveterate habits of insult fortified them into a contempt of authority.

The... part... fatis...

To the queen, whose temper was warm, the rudeness of the preachers was a painful and endless inquietude, which, while it fostered her religious prejudices, had the good effect to confirm her constancy to her friends, and

land. and to keep alive her gratitude for their activity. The lord James Stuart, who was entitled to her respect and esteem from his abilities, and his proximity to her in blood had merited rewards and honours by his public services and the vigour of his counsels. After his successful discharge of her commission as chief justiciar and lord lieutenant, she could not think of allowing him to
616 descend from these offices, without bestowing upon him a solid and permanent mark of her favour. She advanced him into the rank of her nobility, by conferring upon him the earldom of Marr. At the same time she contributed to augment his consequence, by facilitating his marriage with Agnes the daughter of the earl of Marischal; and the ceremonial of this alliance was celebrated with a magnificence and ostentation so extravagant in that age, as to excite the fears of the preachers lest some avenging judgment or calamity should afflict the land. They exclaimed with virulence against his riotous feasting and banquets; and the masquerades which were exhibited upon this occasion, attracting in a still greater degree their attention, as being a species of entertainment hitherto unknown in Scotland, and which was favourable to the profaneness of gallantry, they pointed against them the keenest strokes of their censure and indignation.

The abilities of the earl of Marr, the ascendency he maintained in the councils of his sovereign, and the distinctions which he had acquired, did not fail to expose him to uncommon envy. The most desperate of his enemies, and the most formidable, was the earl of Huntley. In their rivalship for power, many causes of disgust had arisen. The one was at the head of the Protestants, the other was the leader of the Papists. Upon the death of Francis II. Huntley and the Popish faction had sent a deputation to Mary, inviting her to return to Scotland, and offering to support her with an army of 20,000 men. His advances were treated with attention and civility, but his offer was rejected. The invitation of the Protestants, presented by the earl of Marr, was more acceptable to her. Huntley had advised her to detain his rival in confinement in France till the Roman Catholic religion should be re-established in Scotland. This advice she not only disregarded, but
618 caressed his enemy with particular civilities. Upon her arrival in her own country, Huntley renewed his advances, offering to her to set up the mass in all the northern counties. He even conversed in a pressing manner upon this subject with her uncles and the French courtiers who attended her. Still no real attention was paid to him. He came to her palace, and was received only with respect. He was lord high chancellor without influence, and a privy counsellor without trust. The earl of Marr had the confidence of his sovereign, and was drawing to him the authority of government. These were cruel mortifications to a man of high rank, inordinate ambition, immense wealth, and who commanded numerous and warlike retainers. But he was yet to see a stroke still more severely excruciating, and far more destructive of his consequence. The opulent estate of Marr, which Mary had erected into an earldom and conferred upon his rival, had been lodged in his family for some time. He considered it as his property, and that it was never to be torn from his house. This blow was at once to insult most sensibly his pride, and to cut most fatally the sinews of his greatness.

After employing aginst the earl of Marr those arts of detraction and calumny which are so common in courts, he drew up and subscribed a formal memorial, in which he accused him of aiming at the sovereignty of Scotland. This paper he presented to the queen; but the arguments with which he supported his charge being weak and inconclusive, she was the more confirmed in her attachment to her minister. Huntley then addressing himself to the earl of Bothwel, a man disposed to desperate courses, engaged him to attempt to involve the earl of Marr and the house of Hamilton in open and violent contention. Bothwel represented to Marr the enmity which had long subsisted between him and the house of Hamilton. It was an obstacle to his greatness; and while its destruction might raise him to the highest pinnacle of power, it would be most acceptable to the queen, who beside the hatred which princes naturally entertain to their successors, was animated by particular causes of offence against the duke of Chatelherault and the earl of Arran. He concluded his exhortation with making an unlimited offer of his most strenuous services in the execution of this flagitious enterprise. The earl of Marr, however, abhorring the baseness of the project, suspicious of the sincerity of the proposer, or satisfied that his eminence did not require the aid of such arts, rejected all his advances. Bothwel, disappointed upon one side, turned himself to the other. He practised with the house of Hamilton to assassinate the earl of Marr, whom they considered as their greatest enemy. The business, he said, might be performed with ease and expedition. The queen was in use to hunt the deer in the park of Falkland; and there the earl of Marr, unsuspecting any danger, and slenderly attended, might be overpowered and put to death. The person of the queen, at the same time, might be seized; and by detaining her in custody, a sanction and security might be given to their crime. The integrity of the earl of Arran revolting against this conspiracy, defeated its purposes. Dreading the perpetration of so cruel an action, and yet sensible of the resolute determination of his friends, he wrote privately to the earl of Marr, informing him of his danger. But the return of Marr to his letter, thanking him for his intelligence, being intercepted by the conspirators, Arran was confined by them under a guard in Kinneil-house. He effected notwithstanding his escape, and made a full discovery of the plot to the queen. Yet in a matter so dark he could produce no witnesses and no written vouchers to confirm his accusations. He therefore, according to the fashion of the times, offered to prove his information, by engaging Bothwel in single combat. And though in his examinations before the privy council, his love to the queen, his attachment to the earl of Marr, the atrocity of the scheme he revealed, and, above all, his duty and concern for his father the duke of Chatelherault, threw him into a perturbation of mind which expressed itself violently in his speech, his countenance, and his actions; yet his declarations, in general, were so consistent and firm, that it was thought advisable to take the command of the castle of Dunbarton from the duke of Chatelherault, to confine the other conspirators to different prisons, and to wait the farther discoveries which might be made by accident and time.

The

otland.

The earl of Huntley, inflamed by these disappointments, invented other devices. He excited a tumult while the queen and the earl of Marr were at St Andrew's with only a few attendants; imagining that the latter would sally forth to quell the insurgents, and that a convenient opportunity would thus be afforded for putting him to the sword without detection. The caution, however, of the earl of Marr, defeating this purpose, he ordered some of his retainers to attack him in the evening when he should leave the queen; but these assassins being surprised in their station, Huntley affected to excuse their being in arms in a suspicious place and at a late hour, by frivolous apologies, which, though admitted, could not be approved.

About this period, too, letters were received by Mary from the pope and the cardinal of Lorrain, in consequence of the intrigues of the earl of Huntley and the Roman Catholic faction. They pressed her to consider, that while this nobleman was the most powerful of her subjects, he was by far the most zealous in the interests of the church of Rome. They entreated her to flatter him with the hope of her marriage with Sir John Gordon his second son; held out to her magnificent promises of money and military supplies, if she would set herself seriously to recover to power and splendour the ancient religion of her country; and recommended it to her to take measures to destroy the more strenuous Protestants about her court, of whom a roll was transmitted to her, which included the name of her confidant and minister the earl of Marr. These letters could not have reached her at a juncture more unfavourable for their success. The earl of Marr, to whom she communicated them, was encouraged to proceed with the greatest vigour in undermining the designs and the importance of his enemies.

622 / ohn / lon / nds / l Ogil- / nd is / ehend-

New incidents exasperated the animosities of the enemies of the earl of Marr and his own. Sir John Gordon and the lord Ogilvie having a private dispute, happened to meet each other in the high street of Edinburgh. They immediately drew their swords; and the lord Ogilvie receiving a very dangerous wound, Sir John Gordon was committed to prison by the magistrates. The queen, at this time in Stirling, was informed by them of the riot; and while they expressed a fear lest the friends of the prisoner should rise up in arms to give him his liberty, they mentioned a suspicion which prevailed, that the partizans of the lord Ogilvie were to assemble themselves to vindicate his quarrel. The queen, in her reply, after commending their diligence, instructed them to continue to have a watch over their prisoner; made known her desire that the law should take its course; and counselled them to have no apprehensions of the kindred of the parties at variance, but to rely upon the earl of Marr for providing a sufficient force for their protection. Sir John Gordon, however, found the means to break from his confinement; and flying into Aberdeenshire, filled the retainers of his family with his complaints, and added to the disquiets of his father the earl of Huntley.

623 / scapes / pri-

The queen, upon returning to Edinburgh, held a consultation upon affairs of state with her privy-council; and soon after set out upon a progress to the northern parts of her kingdom. At Aberdeen she was met by the lady Huntley, a woman of deep dissimulation and of refined address; who endeavoured to conciliate her affections, was prodigal of flattery, expressed her zeal for the Popish religion, and let fall insinuations of the great power of her husband. She then interceded with the queen for forgiveness to her son: and begged with a keen importunity, that he might be permitted to have the honour to kiss her hand. But Mary having told her, that the favour she had solicited could not possibly be granted till her son should return to the prison from which he had escaped, and submit to the justice of his country, the lady Huntley engaged that he should enter again into custody, and only entreated, that, instead of being confined at Edinburgh, he should be conducted to the castle of Stirling. This request was complied with; and in the prosecution of the business, a court of justiciary being called, Sir John Gordon made his appearance, and acknowledged himself to be the queen's prisoner. The lord Glamis was appointed to conduct him to the castle of Stirling. But upon the road to this fortress, he deceived the vigilance of his guards, hastened back, and gathering 1000 horsemen among his retainers, intrusted his security to the sword.

Scotl / 62 / and at- / tempts / raise a / bellion

In the mean time, the queen continued her progress. The earl of Huntley joined himself to her train. His anxiety to induce her to allow him to attend her to his house of Strathbogy was uncommon; his entreaties were even pressed beyond the bounds of propriety. The intelligence arrived of the escape and rebellion of Sir John Gordon. The behaviour of the father and the son awakened in her the most alarming suspicions. Assembling her privy-council, who, according to the fashion of those times, constituted her court, and attended her person in her progresses though her dominions; she, with their advice, commanded her heralds to charge Sir John Gordon and his adherents to return to their allegiance, and to surrender up to her their houses of strength and castles, under the pains of high treason and forfeiture. Disdaining now to go to the house of the earl of Huntley, where, as it afterwards appeared, that nobleman had made secret preparations to hold her in captivity, she advanced to Inverness by a different route. In the castle of Inverness she proposed to take up her residence; but Alexander Gordon the deputy governor, a dependent of the family of Huntley, refused to admit her. She was terrified with the prospect of a certain and imminent danger. Her attendants were few in number, the town was without walls, and the inhabitants were suspected. In this extremity, some ships in the river were kept in readiness as a last refuge; and she issued a proclamation, commanding all her loyal subjects in those parts immediately to repair to her for her protection. The Frasers and Monroes came in crowds to make her the offer of their swords. The Clan Chattan, though called to arms by the earl of Huntley, forsook his standard for that of their sovereign, when they discovered that his intentions were hostile to her. She employed this strength in laying siege to the castle, which surrendered itself upon the first assault. The lives of the common soldiers were spared, but the deputy-governor was instantly executed. The queen, full of apprehensions, returned to Aberdeen.

To intimidate the earl of Huntley, to punish the troubles which his family had created to the queen, and to convince him that his utter ruin was at hand, a measure

a meafure infinitely humiliating was now concerted and put in practice. The earl of Marr refigned the rich eftate of that name to the lord Erfkine, who laid claim to it as his right; and received in recompenfe, after its erection into an earldom, the territory of Murray, which made an extenfive portion of the poffeffions of the earl of Huntley.

The lady Huntley haftened to Aberdeen to throw herfelf at the feet of her fovereign, to make the offer of the moft humble fubmiffions on the part of her hufband, and to avert by every poffible means the downfal of his greatnefs. But all accefs to the queen was refufed to her; and the earl of Huntley was fummoned to appear in perfon before the privy-council, to anfwer for his conduct, and to make a full refignation of all his caftles and fortreffes. He did not prefent himfelf, and was declared to be in open rebellion. A new proclamation was circulated by the queen to collect together a fufficient ftrength to fubdue the infurgents. The command of her troops was given to the earl of Murray, who put them inftantly into motion. Huntley advancing towards Aberdeen to give them battle, was informed of their approach. He halted at Corrichie, folacing himfelf with the hope of a decifive victory. The army of the queen was the moft numerous; but there were feveral companies in it in whom little confidence could be placed. Thefe the earl of Murray pofted in the front of the battle, and commanded them to begin the attack. They recoiled upon him in diforder, according to his expectation; but a refolute band in whom he trufted, holding out their fpears, obliged them to take a different courfe. Their confufion and flight made Huntley conceive that the day was his own. He therefore ordered his foldiers to throw afide their lances, and to rufh upon the enemy fword in hand. His command was obeyed, but with no precaution or difcipline. When his men came to the place where the earl of Murray had ftationed himfelf, the points of the extended fpears of his firm battalion put a termination to their progrefs. The panic communicated by this unexpected refiftance was improved by the vigour with which he preffed the affailants. In their turn they took to flight. The companies of the queen's army which had given way in the beginning of the conflict were now difpofed to atone for their mifconduct; and taking a fhare in the battle, committed a fignal flaughter upon the retainers of the earl of Huntley. This nobleman himfelf expired in the throng of the purfuit. His fons Sir John Gordon and Adam Gordon were made prifoners, with the principal gentlemen who had affifted him.

Mary, upon receiving the tidings of this fuccefs, difcovered neither joy nor forrow. The paffions, however, of the earl of Murray and his party were not yet completely gratified. Sir John Gordon was brought immediately to trial, confeffed his guilt, and was condemned to fuffer as a traitor. The fentence accordingly was executed, amidft a multitude of fpectators, whofe feelings were deeply affected, while they confidered his immature death, the manlinefs of his fpirit, and the vigour of his form. Adam Gordon, upon account of his tender age, was pardoned; and fines were levied from the other captives of condition according to their wealth. The lord Gordon, after the battle of Corrichie, fled to his father-in-law the duke of Chatelherault, and put himfelf under his protection; but was delivered up by that nobleman, all whofe endeavours in his favour were ineffectual. He was convicted of treafon, and condemned; but the queen was fatisfied with confining him in prifon. The dead body of the earl of Huntley was carried to Edinburgh, and kept without burial, till a charge of high treafon was preferred againft him before the three eftates. An oftentatious difplay was made of his criminal enterprifes, and a verdict of parliament pronounced his guilt. His eftates, hereditary and moveable, were forfeited; his dignity, name, and memory, were pronounced to be extinct; his enfigns armorial were torn from the book of arms; and his pofterity were rendered unable to enjoy any offices, honour, or rank, within the realm.

626
An interview propofed between Mary and Elizabeth but in...

While thefe fcenes were tranfacting, Mary, who was fincerely folicitous to eftablifh a fecure amity between the two kingdoms, opened a negotiation to effectuate an interview with Elizabeth. Secretary Maitland, whom fhe employed in this bufinefs, met with a moft gracious reception at the court of London. The city of York was appointed as the place where the two queens fhould exprefs their mutual love and affection, and bind themfelves to each other in an indiffoluble union; the day of their meeting was fixed; the fafhion and articles of their interview were adjufted; and a fafe conduct into England was granted to the queen of Scots by Elizabeth. But in this advanced ftate of the treaty it was unexpectedly interrupted. The difturbances in France, the perfecution of the Proteftants there, and the dangerous confequence which threatened the reformed countries, feemed to require Elizabeth to be particularly upon her guard, and to watch with eagernefs againft the machinations of the adverfaries of her religion. Upon thefe pretences fhe declined for a feafon the projected interview; fending to Mary with this apology Sir Henry Sidney, a minifter of ability, whom fhe inftructed to dive into the fecret views of the Scottifh queen. This was a fevere difappointment to Mary; but it is reafonable to believe, that Elizabeth acted in the negotiation without fincerity, and upon principles of policy. It was not her intereft to admit into her kingdom a queen who had pretenfions to her crown, and who might ftrengthen them; who might raife the expectations of her Roman Catholic fubjects, and advance herfelf in their efteem; and who far furpaffed her in beauty, and in the bewitching allurement of converfation and behaviour.

62[7]
Chatelard falls in love with the queen.

Amidft affairs of great moment, a matter of fmaller confequence, but which is interefting in its circumftances, deferves to be recorded. Chatelard, a gentleman of family in Dauphiny, and a relation of the chevalier de Bayard, had been introduced to Queen Mary by the fieur Damville, the heir of the houfe of Montmorency. Polifhed manners, vivacity, attention to pleafe, the talent of making verfes, and an agreeable figure, were recommendations to this man. In the court they drew attention to him. He made himfelf neceffary in all parties of pleafure at the palace. His affiduities drew to him the notice of the queen; and, at different times, fhe did him the honour to dance with him. His complaifance became gradually more familiar. He entertained her with his wit and good humour; he made verfes upon her beauty and accomplifhments; and her politenefs and condefcenfion infinuated

into

tland.

into him other sentiments than gratitude and reverence. He could not behold her charms without feeling their power: and instead of stifling in its birth the most dangerous of all the passions, he encouraged its growth. In an unhappy moment, he entered her apartment; and, concealing himself under her bed, waited the approach of night. While the queen was undressing, her maids, discovered his situation, and gave her the alarm. Chatelard was dismissed with disgrace; but soon after received her pardon. The frenzy, however, of his love compelling him to repeat his crime, it was no longer proper to show any compassion to him. The delicate situation of Mary, the noise of these adventures, which had gone abroad, and the rude suspicions of her subjects, required that he should be tried for his offences and punished. This imprudent man was accordingly condemned to lose his head; and the sentence was put in execution.

628 ...t to ...n.

The disagreeable circumstances in which Mary found herself involved by reason of her quarrel with Elizabeth, the excessive bigotry and overbearing spirit of her Protestant subjects, together with the adventure of Chatelard, and the calomnies propagated in consequence of it, determined her to think of a second marriage. Her beauty and expectations of the crown of England, joined to the kingdom which she already possessed, brought her many suitors. She was addressed by the king of Sweden, the king of Navarre, the prince of Condé, the duke of Ferrara, Don Carlos of Spain, the archduke Charles of Austria, and the duke of Anjou. Her own inclination was to give the preference, among these illustrious lovers, to the prince of Spain; but her dermination, from the first moment, was to make her wishes bend to other considerations and to render her decision upon this important point as agreeable as possible to Queen Elizabeth, to the English nation, and to the Protestants of both kingdoms. Her succession to the crown of England was the object nearest her heart; and Elizabeth, who wished to prevent her from marrying altogether, contrived to impress upon her mind an opinion that any foreign alliance would greatly obstruct that much desired event. She therefore pitched upon two of her own subjects, whom she successively recommended as fit matches for the queen of Scots; and she promised, that upon her acceptance of either of them, her right of inheritance should be inquired into and declared. Lord Robert Dudley, afterwards earl of Leicester, was the first person proposed; and except a manly face and fine figure he had not one quality that could recommend him to the Scottish princess. Whilst Mary received this suitor with some degree of composure, she did not altogether repress her scorn. "She had heard good accounts (she owned) of the gentleman; but as Queen Elizabeth had said, that in proposing a husband to her, she would consult her honour, she asked what honour there could be in marrying a subject?" The English queen then brought under the eye of Mary another suitor, lest her thoughts should return to a foreign alliance. This was Lord Darnley, of the house of Stuart itself, whose birth was almost equal to her own, and whom the Scottish princess was induced to accept as a husband by motives which we have detailed elsewhere. (See MARY.) Elizabeth however was not more sincere in this proposal than in the former; for after permitting Darnley and his father the earl of Lenox to visit

629 ...y in... ...s to a ...d ...iage, ...is ad... ...ed by ...other ...itors.

630 ...makes ...e of ...d Darn...

Scotland merely with a view of diverting the attention of the queen from the continent, she threw every obstacle in the way of the marriage which art and violence could contrive. When she found Mary so much entangled, that she could hardly draw back, or make any other choice than that of Darnley, Elizabeth attempted to prevent her from going farther on; and now intimated her disapprobation of that marriage, which she herself had not only originally planned, but, in these latter stages, had forwarded by every means in her power. The whole council of Elizabeth declared against the marriage. Even from her own subjects Mary met with considerable opposition. An inveterate enmity had taken place between the duke of Chatelherault and the earl of Lenox, in consequence of which the former deserted the court, and very few of the Hamiltons repaired to it. The lord James Stuart, now earl of Murray, sought to promote the match with Lord Dudley. In consequence of this he was treated openly with disrespect by the earl of Lenox; he lost the favour of his sovereign, and Darnley threatened him with his vengeance when he should be married to the queen. John Knox in the mean time behaved in the most furious manner, forgetting not only the meek and peaceable behaviour of a Christian, but the allegiance of a subject. This preacher even interfered with the marriage of his sovereign. He warned the nobility, that if they allowed a Papist or an infidel to obtain her person and the government of Scotland, they would be guilty, to the full extent of their power, of banishing Jesus Christ from the kingdom, of bringing down upon it the vengeance of God, of being a curse to themselves, and of depriving their queen of all comfort and consolation. As Darnley was a Papist, he was of consequence execrated by the whole body of Protestants, laity as well as clergy; while, on the other hand, he was supported by the earls of Athol and Caithness, the lords Ruthven and Hume, and the whole Popish faction.

6... Extra...gant ...viour John

It was exceedingly unfortunate for the queen, that neither Lord Darnley himself, nor his father the earl of Lenox, had any talents for business; and as they naturally had the direction of the queen's affairs, it is no wonder that they were very ill managed. But a source of opposition, more violent than any imperfections of their own, rose up to them in the attachment which they discovered to a person upon whom the queen had of late bestowed her favour with an imprudent prodigality. David Rizzio from a mean origin raised himself to a distinguished eminence. He was born at Turin, where his farther earned a subsistence as a musician. Varieties of situation and adventure, poverty, and misfortunes, had taught him experience. In the train of the count de Morette, the ambassador from the duke of Savoy, he had arrived in Scotland. The queen, desirous to complete her band of music, admitted him into her service. In this humble station he had the dexterity to attract her attention; and her French secretary falling into disgrace, from negligence and incapacity, he was promoted to discharge the duties of his office. A necessary and frequent admission to her company afforded him now the fullest opportunity to recommend himself to her; and while she approved his manners, she was sensible of his fidelity and his talents. His mind, however, was not sufficiently vigorous to bear with success and prosperity. Ambition grew upon him with preferment. He interfered

6... Accou... David ...zio.

interfered in affairs of moment, intruded himfelf into the conventions of the nobles at the palace, and was a candidate for greatnefs. The queen confulted with him upon the moft difficult and important bufinefs, and intrufted him with real power. The fupplenefs, fervility, and unbounded complaifance which had characterized his former condition, were exchanged for infolence, oftentation, and pride. He exceeded the moft potent barons in the ftatelinefs of his demeanour, the fumptuoufnefs of his apparel, and the fplendour of his retinue. The nobles, while they defpifed the lownefs of his birth, and detefted him as a foreigner, and a favourite, were mortified with his grandeur, and infulted with his arrogance. Their anger and abhorrence were driven into fury; and while this undeferving minion, to uphold his power, courted Darnley, and with officious affiduities advanced his fuit with the queen, he haftened not only his own ruin, but laid the foundations of cruel outrages and of public calamity.

3 ...rl of ...y ...ne ...s fa-

To the earl of Murray the exaltation of Rizzio, fo offenfive in general to the nation, was humiliating in a more particular degree. His interference for the earl of Leicefter, the partiality he entertained for Elizabeth, his connexions with Secretary Cecil, and the favour he had fhown to Knox, had all contributed to create in Mary a fufpicion of his integrity. The practices of Darnley and Rizzio were thence the more effectual; and the fulleft weight of their influence was employed to undermine his power. His paffions and difgufts were violent; and in his mind he meditated revenge. Mary, aware of her critical fituation, was folcitous to add to her ftrength. Bothwel, who had been imprifoned for confpiring againft the life of the earl of Murray, and who had efcaped from confinement, was called from France; the earl of Sutherland, an exile in Flanders, was invited home to receive his pardon; and George Gordon, the fon of the earl of Huntley, was admitted to favour, and was foon to be reinftated in the wealth and honours of his family.

As foon as Bothwel arrived, the earl of Murray infifted that he fhould be brought to a trial for having plotted againft his life, and for having broke from the place of his confinement. This was agreed tu; aud on the day of trial Murray made his appearance with 800 of his adherents. Bothwel did not choufe to contend with fuch a formidable enemy; he therefore fled to France, and a proteftation was made, importing that his fear of violence had been the caufe of his flight. The queen commanded the judge not to pronounce fentence. Murray complained loudly of her partiality, and engaged deeper and deeper in cabals with Queen Elizabeth. Darnley, in the mean time, preffed his fuit with eagernefs. The queen ufed her utmoft endeavours to caufe Murray fubfcribe a paper expreffing a confent to her marriage; but all was to no purpofe. However, many of the nobility did fubfcribe this paper; and fhe ventured to fummon a convention of the eftates at Stirling, to whom fhe opened the bufinefs of the marriage; and who approved of her choice, provided the Proteftant religion fhould continue to be the eftablifhment.

In the mean time ambaffadors arrived from England, with a meffage importing Elizabeth's entire difapprobation and difallowance of the queen's marriage with Lord Darnley. But to thefe ambaffadors Mary only replied, that matters were gone too far to be recalled; and that Elizabeth had no folid caufe of difpleafure, fince, by her advice, fhe had fixed her affections not upon a foreigner, but upon an Englifhman; and fince the perfon fhe favoured was defcended of a diftinguifhed lineage, and could boaft of having in his veins the royal blood of both kingdoms. Immediately after this audience fhe created Lord Darnley a lord and a knight. The oath of knighthood was adminiftered to him. He was made a baron and a banneret, and called *Lord Armanagh*. He was belted earl of Rofs. He then promoted 14 gentlemen to the honour of knighthood, and did homage to the queen, without any refervation of duty to the crown of England, where his family had for a long time refided. His advancement to the duke of Albany was delayed for a little time; and this was fo much refented by him, that, when informed of it by the lord Ruthven, he threatened to ftab that nobleman with his dagger.

In the mean time the day appointed for the affembly of parliament, which was finally to determine the fubject of the marriage, was now approaching. The earl of Murray, encouraged by the apparent firmnefs of Elizabeth, goaded on by ambition, and alarmed with the approbation beftowed by the convention of the eftates on the queen's choice of Lord Darnley, perceived that the moment was at hand when a decifive blow fhould be ftruck. To infpirit the refentment of his friends, and to juftify in fome meafure the violence of his projects, he affected to be under apprehenfions of being affaffinated by the lord Darnley. His fears were founded abroad; and he avoided to go to Perth, where he affirmed that the plot againft him was to be carried into execution. He courted the enemies of Darnley with unceafing affiduity; and he united to him in a confederacy the duke of Chatelherault, and the earls of Argyll, Rothes, and Glencairn. It was not the fole object of their affociation to oppofe the marriage. They engaged in more criminal enterprifes. They meditated the death of the earl of Lenox and the lord Darnley; and while the queen was upon the road to Calander place to vifit the lord Livingftone, they propofed to intercept her and to hold her in captivity. In this ftate of her humiliation, Murray was tu advance himfelf into the government of the kingdom, under the character of its regent. But Mary having received intelligence of their confpiracy, the earl of Athol and the lord Ruthven raifed fuddenly 300 men to protect her in her journey. Defeated in this fcheme, the earl of Murray and his affociates did not relinquifh their cabals. They thought of new achievements; and the nation was filled with alarms, fufpicions, and terror. 63 An aff- tion ag- the qu- and D- ley.

63 Distur- ces rai- by the -teftant

Amidft the arts employed by the Scottifh malecontents to inflame the animofities of the nation, they forgot not to infift upon the dangers which threatened the Proteftant religion from the advancement of Lord Darnley, and from the rupture that muft enfue with England. Letters were everywhere difperfed among the faithful, reminding them of what the eternal God had wrought for them in the abolition of idolatry, and admonifhing them to oppofe the reftoration of the mafs. A fupplication was prefented to the queen, complaining of idolaters, and infifting upon their punifhment. In the prefent juncture of affairs it was received with unufual refpect; and Mary inftructed the Popifh ecclefiaftics to abftain

abstain from giving offence of any kind to the Protestants. A priest, however, having celebrated the mass, was taken by the brethren, and exposed to the insults and fury of the populace at the market-place of Edinburgh, in the garments of his profession, and with the chalice in his hand; and the queen having given a check to this tumultuous proceeding, the Protestants, rising in their wrath, were the more confirmed in the belief that she meant to overthrow their religion. The most learned and able of the clergy held frequent consultations together; and while the nation was disturbed with dangerous ferments, the General Assembly was called to deliberate upon the affairs of the church. Their hope of success being proportioned to the difficulties in the situation of the queen, they were the less scrupulous in forming their resolutions; and the commissioners, whom they deputed to her, were ordered to demand a parliamentary ratification of their desires.

636
...r de...ds.

They insisted, that the mass, with every remain whatsoever of Popery, should be universally suppressed throughout the kingdom; that in this reformation, the queen's person and houshold should be included; and that all Papists and idolaters should be punished upon conviction according to the laws. They contended, that persons of every description and degree should resort to the churches upon Sunday, to join in prayers, and to attend to exhortations and sermons; that an independent provision should be assigned for the support of the present clergy, and for their successors; that all vacant benefices should be conferred upon persons found to be qualified for the ministry, upon the trial and examination of the superintendants; that no bishopric, abbey, priory, deanery, or other living, having many churches, should be bestowed upon a single person; but that, the plurality of the foundation being dissolved, each church should be provided with a minister; that the glebes and manses should be allotted for the residence of the ministers, and for the reparation of churches; that no charge in schools or universities, and no care of education, either public or private, should be intrusted to any person who was not sound and able in doctrine, and who was not approved by the superintendants; that all lands which of old had been devoted to hospitality, should again be made subservient to it; that the lands and rents which formerly belonged to the monks of every order, with the annuities, alterages, obits, and the other emoluments which had appertained to priests, should be employed in the maintenance of the poor and the upholding of schools; that all horrible crimes, such as idolatry, blasphemy, breaking of the Sabbath, witchcraft, sorcery, enchantment, adultery, manifest whoredom, the keeping of brothels, murder, and oppression, should be punished with severity; that judges should be appointed in every district, with powers to pronounce sentences and to execute them; and, in fine, that for the ease of the labouring husbandmen, some order should be devised concerning a reasonable payment of the tythes.

637
...deration ...e ...n.

To these requisitions, the queen made an answer full of moderation and humanity. She was ready to agree with the three estates in establishing the reformed religion over the subjects of Scotland; and she was steadily resolved not to throw into hazard the life, the peace, or the fortune, of any person whatsoever upon account of his opinions. As to herself and her houshold, she was persuaded that her people would not urge her to adopt tenets in contradiction to her own conscience, and thereby involve her in remorse and uneasiness. She had been nourished and brought up in the Romish faith; she conceived it to be founded on the word of God; and she was desirous to continue in it. But, setting aside her belief and religious duty, she ventured to assure them, that she was convinced from political reasons, that it was her interest to maintain herself firm in the Roman Catholic persuasion. By departing from it, she would forfeit the amity of the king of France, and that of other princes who were now strongly attached to her; and their disaffection could not be repaired or compensated by any new alliance. To her subjects she left the fullest liberty of conscience; and they could not surely refuse to their sovereign the same right and indulgence. With regard to the patronage of benefices, it was a prerogative and property which it would ill become her to violate. Her necessities, and the charge of her royal dignity, required her to retain in her hands the patrimony of the crown. After the purposes, however, of her station, and the exigences of government, were satisfied, she could not object to a special assignment of revenue for the maintenance of the ministry; and, on the subject of the other articles which had been submitted to her, she was willing to be directed by the three estates of the kingdom, and to concur in the resolutions which should appear to them the most reasonable and expedient.

6...
The ... stants ... displea... with ... answ...

The clergy, in a new assembly or convention, expressed a high displeasure with this return to their address. They took the liberty to inform the queen, that the doctrines of the Reformation which she refused to adopt, were the religion which had been revealed by Jesus Christ, and taught by the apostles. Popery was of all persuasions the least alluring, and had the fewest recommendations. In antiquity, consent of people, authority of princes, and number of proselytes, it was plainly inferior to Judaism. It did not even rest upon a foundation so solid as the doctrines of the Alcoran. They required her, therefore, in the name of the eternal God, to embrace the means of attaining the truth, which were offered to her in the preaching of the word, or by the appointment of public disputations between them and their adversaries. The errors of the mass were placed before her in all their deformity. The sayer of it, the action itself, and the opinions expressed in it, were all pronounced to be equally abominable. To hear the mass, or to gaze upon it, was to commit the complicated crimes of sacrilege, blasphemy, and idolatry. Her delicacy in not renouncing her opinions from the apprehension of offending the king of France and her other allies, they ridiculed as impertinent in the highest degree. They told her, that the true religion of Christ was the only means by which any confederacy could endure; and that it was far more precious than the alliance of any potentate whatsoever, as it would bring to her the friendship of the King of kings. As to patronages, being a portion of her patrimony, they intended not to defraud her of her rights: but it was their judgment, that the superintendants ought to make a trial of the qualifications of candidates for the ministry; and it was the duty of the patron to present a person to the benefice, it was the business of the church to manage his institution or collation. For without this restraint,

restraint, there would be no security for the fitness of the incumbent; and if no trials or examinations of ministers took place, the church would be filled with misrule and ignorance. Nor was it right or just that her majesty should retain to herself any part of the revenue of benefices; as it ought to be all employed to the uses of the clergy, for the purposes of education, and for the support of the poor. And as to her opinion, that a suitable assignment should be made for them, they could not but thank her with reverence: but they begged to solicit and importune her to condescend upon the particulars of a proper scheme for this end, and to carry it into execution; and that, taking into a due consideration the other articles of their demands, she would study to comply with them, and to do justice to the religious establishment of her people.

From the fears of the people about their religion, disturbances and insurrections were unavoidable; and before Mary had given her answer to the petitions or address of the clergy, the Protestants, to a formidable number, had marched to St Leonard's Craig; and, dividing themselves into companies, had chosen captains to command them. But the leaders of this tumult being apprehended and committed to close custody, it subsided by degrees; and the queen, upon the intercession of the magistrates of Edinburgh, instead of bringing them to trial, gave them a free pardon. To quiet, at the same time, the apprehensions which had gone abroad, and to controvert the insidious reports which had been industriously spread of her inclination to overturn the reformed doctrines, she repeatedly issued proclamations, assuring her subjects, that it was her fixed determination not to molest or disturb any person whatsoever upon account of his religion or conscience; and that she had never presumed even to think of any innovation that might endanger the tranquillity or do a prejudice to the happiness of the commonwealth.

While Mary was conducting her affairs with discernment and ability, the earl of Murray and his confederates continued their consultations and their intrigues. After their disappointment in the conspiracy against the queen and the Lord Darnley, they perceived that their only hope of success or security depended upon Elizabeth; and as Randolph had promised them her protection and assistance, they scrupled not to address a letter to her, explaining their views and situation. The pretences of their hostility to their sovereign upon which they affected to insist, were her settled design to overturn the Protestant religion, and her rooted desire to break all correspondence and amity with England. To prevent the accomplishment of these purposes, they said, was the object of their confederacy; and with her support and aid they did not doubt of being able to advance effectually the emolument and advantage of the two kingdoms. In the present state of their affairs, they applied not, however, for any supply of her troops. An aid from her treasury was now only necessary to them; and they engaged to bestow her bounty in the manner the most agreeable to her inclinations and her interests. The pleasure with which Elizabeth received their application was equal to the aversion she had conceived against the queen of Scots. She not only granted to them the relief they requested, but assured them by Randolph of her esteem and favour while they should continue to uphold the reformed religion and the connexion of the two nations. Flattered by her assurances and generosity, they were strenuous to gain partizans, and to disunite the friends of their sovereign; and while they were secretly preparing for rebellion, and for trying their strength in the field, they disseminated among the people the tenets, That a Papist could not legally be their king: that the queen was not at liberty of herself to make the choice of a husband; and that, in a matter so weighty, she ought to be entirely directed by the determination of the three estates assembled in parliament.

641
Treachery
of Elizabeth.

Elizabeth, at the same time, carrying her dissimulation to the most criminal extremity, commanded Randolph to ask an audience of Mary; and to counsel her to nourish no suspicions of the earl of Murray and his friends; to open her eyes to their sincerity and honour; and to call to mind, that as their services had hitherto preserved her kingdom in repose, her jealousies of them might kindle it into combustion, make the blood of her nobles to flow, and cast into hazard her person and her crown. Full of astonishment at a message so rude and so improper, the queen of Scots desired him to inform his mistress, that she required not her instructions to distinguish between patriotism and treachery; that she was fully sensible when her will or purpose was resisted or obeyed; and that she possessed a power which was more than sufficient to repress and to punish the enormities and the crimes of her subjects. The English resident went now to the earl of Lenox and the lord Darnley, and charged them to return to England. The former expressed an apprehension of the severity of his queen, and sought an assurance of her favour before he could venture to visit her dominions. The latter, exerting greater fortitude, told him, that he acknowledged no duty or obedience but to the queen of Scots. The resident treating this answer as disrespectful to Elizabeth, turned his back upon the Lord Darnley, and retired without making any reverence, or bidding him an adieu.

The behaviour of Elizabeth, so fierce and so perfidious, was well calculated to confirm all the intentions of Mary; and this, doubtless, was one of the motives with which she was actuated. But while the queen of Scots was eager to accomplish her marriage, she was not inattentive to the rising troubles of her country. The parliament which she had appointed could not now be held: it was therefore prorogued to a more distant day; and the violence of the times did not then permit it to assemble. By letters she invited to her, with all their retainers, the most powerful and the most eminent of her subjects. Bothwel was recalled anew from France; and by general proclamations she summoned to her standard the united force of her kingdom. The castle of Edinburgh was likewise provided amply with stores and ammunition, that, in the event of misfortunes, it might afford her a retreat and defence. The alacrity with which her subjects flocked to her from every quarter, informed her of her power and popularity; and while it struck Murray and his adherents with the danger to which they were exposed, it declared to them the opinion entertained by the nation of the iniquity and the selfishness of their proceedings.

642
Marriage
of Mary
with Lord
Darnley.

On the 29th of July 1565, the ceremony of marriage between the queen and Lord Darnley was performed. The latter had been previously created duke of

Albany.

Albany. The day before the marriage, a proclamation was published, commanding him to be styled *king of the realm*, and that all letters after their marriage should be directed in the names of her husband and herself. The day after it, a new proclamation was issued confirming this act: he was pronounced king by the sound of trumpets, and associated with the queen in her government. This measure seems to have been the effect of the extreme love the queen had for her husband, which did not permit her to see that it was an infringement of the constitution of the kingdom; though perhaps she might also be urged to it by the pressing eagerness of Lord Darnley himself, and the partial counsels of David Rizzio. The earl of Murray made loud complaints, remonstrated, that a king was imposed upon the nation without the consent of the three estates, and called upon the nation to arm against the beginnings of tyranny. The malcontents accordingly were immediately in arms; but their success was not answerable to their wishes. The bulk of the nation were satisfied with the good intentions of their sovereign, and she herself took the earliest opportunity of crushing the rebellion in its infancy. The earl of Murray was declared a traitor; and similar steps were taken with others of the chiefs of the rebels. She then took the field against them at the head of a considerable army; and having driven them from place to place, obliged them at last to take refuge in England. Queen Elizabeth received them with that duplicity for which her conduct was so remarkable. Though she herself had countenanced, and even excited them to revolt, she refused to give an audience to their deputies. Nay, she even caused them to emit a public declaration, that neither she, nor any person in her name, had ever excited them to their rebellious practices. Yet, while the public behaviour of Elizabeth was so acrimonious, she afforded them a secure retreat in her kingdom, treated the earl of Murray in private with respect and kindness, and commanded the earl of Bedford to supply him with money. Mary, however, resolved to proceed against the rebels with an exemplary rigour. The submissions of the duke of Chatelherault alone, who had been less criminal than the rest, were attended to. But even the favour which he obtained was precarious and uncertain; for he was commanded to use the pretence of sickness, and to pass for some time into foreign countries. A parliament was called: and a summons of treason being executed against the earls of Argyll, Glencairn, and Rothes, with others of the principal rebels, they were commanded to appear before the three estates; in default of which their lives and estates were declared to be forfeited.

643 ...s proc...ed ... of ...and.

644 ...rebel- nobles ...n into ...and.

In the mean time Throgmorton the English ambassador solicited the pardon of the rebels; which Mary was at first inclined to grant. However, by the persuasion of the court of France, she was not only induced to proceed against them with rigour, but acceded to the treaty of Bayonne, by which the destruction of the Protestants was determined. This measure filled the whole court with terror and dismay. The rebels were acquainted with the danger of their situation; and being now driven desperate, they were ready to engage in the most atrocious designs. Unhappily, the situation of affairs in Scotland rendered the accomplishment of their purposes but too easy. Violent disgusts had taken place between the queen and her husband. Her fondness had been excessive; but she soon perceived that the qualities of his mind were not proportioned to his personal accomplishments. He was proud, disdainful, and suspicious. No persuasions could correct his wilfulness; and he was at the same time giddy and obstinate, insolent and mean. The queen in consequence began to show an indifference towards him; which he took care to augment, by showing the like indifference towards her, and engaging in low intrigues and amours, indulging himself in dissipation and riot, &c. However, the desire of dominion was her ruling passion: and the queen, finding his total incapacity for exercising his power to any good purpose, had excluded him from it altogether. He was therefore at present a proper object for the machinations of the rebels, and readily entered into an agreement with them to depose the queen; vainly thinking by that means that he should secure the crown to himself. However, as the parliament was soon to assemble, in which the rebels had every reason to believe that they would be condemned for high treason, it was necessary that the kingdom should be thrown into disorder before that time came, otherwise their fate was inevitable. Practising on the imbecility of Darnley, they persuaded him that a criminal correspondence subsisted between the queen and David Rizzio (R). For this reason the queen resolved upon his destruction; and the conspirators hoped thereby not only to get an indemnity to themselves, but to effect a total revolution at court, and the entire humiliation of Bothwel, Huntley, and Athol, who were the associates of Rizzio. However, in order to save themselves,

64... Mary ...cedes t... treaty ... Bayon...

64... The ... consp... the d... tion o... vid R... with t... hellion nobles...

(R) That there subsisted a criminal intercourse between Mary and Rizzio is a scandal which is now given up by her enemies. It seems to rest on the authority of Buchanan and Knox: and their evidence in this case is clearly of no weight, not only from their being the strenuous partizans of her adversaries, but from the multitude of falsehoods which they anxiously detail to calumniate her. The love she felt for Darnley was extreme, and their acquaintance commenced a month or two after the appointment of Rizzio to be her secretary for French affairs. She became pregnant soon after her marriage; and it was during her pregnancy that Rizzio was assassinated. These are striking presumptions in her favour. And what seems to put her innocence out of all question, is the silence of the spies and residents of Elizabeth with regard to this amour; for, if there had been any thing real in it, they could not have made their court to their queen more effectually than by declaring to her its peculiarities; and their want of delicacy, so observable in other circumstances, would have induced them upon this occasion to give the greatest foulness and deformity to their information.

It appears that Rizzio was ill-favoured, and of a disagreeable form. Buchanan says of him, "Non faciem cultus honestabat, sed facies cultum destruebat." Hist. Scot. lib. xvii. This expression is very strong; but it would have little weight if other authors had not concurred in giving a similar description of Rizzio. In a book entitled

selves, they engaged the king to subscribe a bond, affirming that the project of assassinating Rizzio was altogether of his own devising; acknowledging that he had solicited them to take a part in it, from the apprehensions that resistance might be made to him; and agreeing, upon the word and honour of a prince, to protect and secure them against every hazard and injury to which they might be exposed from the achievement of his enterprise. Having procured this security, and having allured the earl of Lenox the king's father to approve their measures, they adjusted the method of the projected murder; and despatched a messenger to the English frontier, advertising the earl of Murray and the rebels of their intentions, and inviting them to return to the court.

Upon the 9th day of March, about 7 o'clock in the evening, armed men, to the number of 500, surrounded the palace of Holyroodhouse. The earl of Morton and the Lord Lindsay entered the court of the palace, with 160 persons. The queen was in her chamber at supper, having in her presence her natural sister the countess of Argyll, her natural brother Robert commendator of Holyroodhouse, Betou of Creich master of the household, Arthur Erskine, and David Rizzio. The king entering the apartment, seated himself by her side. He was followed by the Lord Ruthven, who being wasted with sickness, and cased in armour, exhibited an appearance that was hideous and terrible. Four ruffians attended him. In a hollow voice he commanded Rizzio to leave a place which did not become him. The queen, in astonishment and consternation, applied to the king to unfold to her this mysterious enterprise. He affected ignorance. She ordered Ruthven from her presence, under the pain of treason; declaring to him at the same time, that if Rizzio had committed any crime, she would produce him before the parliament, and punish him according to the laws. Ruthven drawing his dagger, advanced towards Rizzio. The queen rose to make an exertion of her authority. The unfortunate stranger laid hold of her garments, crying out for justice and mercy. Other conspirators rushing into the chamber, overturned the table, and increased the dismay and confusion. Loaded pistols were presented to the bosom of the queen. The king held her in his arms. George Douglas, snatching the dagger of his sovereign, plunged it into the body of Rizzio. The wounded and screaming victim was dragged into the antichamber; and so eager were the assassins to complete their work, that he was torn and mangled with 56 wounds.

While the queen was pressing the king to gratify her inquiries into the meaning of a deed so execrable, Ruthven returned into their presence. She gave a full vent to indignation and reproach. Ruthven, with an intolerable coldness and deliberation, informed her, that Rizzio had been put to death by the counsel of her husband, whom he had dishonoured; and that by the persuasion of this minion she had refused the crown-matrimonial to the king, had engaged to re-establish the ancient religion, had resolved to punish the earl of Murray and his friends, and had intrusted her confidence to Bothwel and Huntley, who were traitors. The king, taking the part of Ruthven, remonstrated against her proceedings, and complained that from the time of her familiarity with Rizzio, she had neither regarded, nor entertained, nor trusted him. His suspicions and ingratitude shocked and tortured her. His connexion with the conspirators gave her an ominous anxiety. Apprehensions of outrages still more atrocious invaded her. In these agitated and miserable moments she did not lose herself in the helplessness of sorrow. The loftiness of her spirit communicated relief to her; and wiping away her tears, she exclaimed, that it was not now a season for lamentation, but for revenge.

The earls of Huntley, Bothwel, and Athol, the lords Fleming and Levingston, and Sir James Balfour, who were obnoxious to the conspirators, and at this time in the palace, found all resistance to be vain. Some of them eluding the vigilance of Morton, made their escape; and others were allowed to retire. The provost and magistrates of Edinburgh getting intelligence of the tumult, ordered the alarm bell to be rung. The citizens, apprehensive and anxious, approached in crowds to inquire into the welfare of their sovereign; but she was not permitted to address herself to them. The conspirators told her, that if she presumed to make any harangue, they would "cut her in pieces, and cast her over the walls." The king called to the people that she was well, and commanded them to disperse. The queen was shut up in her chamber, uncertain of her fate, and without the consolation or attendance of her women.

In the morning a proclamation was issued by the king, without the knowledge of his queen, prohibiting the meeting of the parliament, and ordering the members to retire from the city. The rebellious lords now returned

---

entitled, "Le Livre de la Morte de la Reyne d'Ecosse," and printed in the year 1587, he is said to be "disgracié de corps." Caussin, ap. Jebb, p. 37. This work, too, while it records the unkindness of nature to his person, has observed, that he was in his old age when he made a figure in the court of Mary. "Elle traittoit ordinairement avec David Riccio son secretaire, homme agé et prudent, qui possedoit son oreille." Ibid. And other authors give their testimonies to the same purpose.

It is probable that the panegyrists of Mary exaggerate somewhat the imperfections as well as the good qualities of Rizzio. But there seems in general to be no reason to doubt his fidelity and talents, any more than his ugliness and senility. He had therefore a better title to be her secretary than her lover. It is an absurdity to think that a queen so young and beautiful would yield herself to deformity and old age. A common prostitute must be brought to endure this misfortune. The capacity of the man was a recommendation to him; and as he owed every thing to her bounty, and was a stranger, she had the greatest reason to rely upon his faithfulness. The perfidiousness and duplicity of her courtiers drew closer the tie of her connexion; and as Rizzio was studious to make himself agreeable, and was skilful in games of hazard, he was always ready to be a party with her in those innocent amusements which fill up the listless intervals of life. Keith. Append. p. 124.

...land.

650 ...dea- ...s in ...to gain ...arl of ...ray; returned from England, and arrived at Edinburgh within 24 hours after the assassination of Rizzio. The queen, knowing of how much consequence it was for her to gain the earl of Murray, invited him to wait upon her. Notwithstanding the extreme provocation which she had met with, Mary so far commanded her passions, that she gave him a favourable reception. After informing him of the rudeness and severity of the treatment she had met with, the queen observed, that if he had remained in friendship with her at home, he would have protected her against such excesses of hardship and insult. Murray with an hypocritical compassion, shed abundance of tears; while the queen seemed to entertain no doubt of his sincerity, but gave him room to hope for a full pardon of all his offences. In the mean time however, the conspirators held frequent consultations together, in which it was debated, whether they should hold the queen in perpetual captivity or put her to death; or whether they should content themselves with committing her to close custody in Stirling castle till they should obtain a parliamentary sanction to their proceedings, establish the Protestant religion by the total overthrow of the mass, and invest the king with the crown-matrimonial and the government of the kingdom.

651 ...e- ...n the ...to ...our the ...of ...n- ...rs, Mary now began to perceive the full extent of her wretchedness; and therefore, as her last resource, applied to the king, whom she treated with all those blandishments usually employed by the fair sex when they want to gain the ascendancy over the other. The king, who, with all his faults, had a natural facility of temper, was easily gained over. The conspirators were alarmed at his coldness, and endeavoured to fill his mind with fears concerning the duplicity of his wife; but, finding they could not gain their point, they at last began to treat of an accommodation. The king brought them a message, importing, that Mary was disposed to bury in oblivion all memory of their transgressions; and he offered to conduct them into her presence. The earls of Murray and Morton, with the lord Ruthven, attended him into her presence; and, falling on their knees before the queen, made their apologies and submissions. She commanded them to rise; and having desired them to recollect her abhorrence of cruelty and rapaciousness, she assured them with a gracious air, that instead of designing to forfeit their lives, and possess herself of their estates, she was inclined to receive them into favour, and to give a full pardon, not only to the nobles who had come from England, but to those who had assassinated David Rizzio. They were accordingly ordered to prepare the bonds for their security and forgiveness, which the queen promised to take the earliest opportunity of subscribing; but in the mean time the king observed,

652 ...apes ...them. that the conspirators ought to remove the guards which they had placed around the queen, that all suspicion of restraint might be taken away. The measure could not with any propriety be opposed, and the guards were therefore dismissed; upon which the queen, that very night left her palace at midnight, and took the road to Dunbar, accompanied by the king and a few attendants.

The news of the queen's escape threw the conspirators into the utmost consternation; as she immediately issued proclamations for her subjects to attend her in arms, and was powerfully supported. They sent thither the lord Semple, requesting, with the utmost humility, her subscription to their deeds of pardon and security; but to this message she returned an unfavourable answer, and advanced towards Edinburgh with an army of 8000 men. The conspirators now fled with the utmost precipitation. Even John Knox retired to Kyle till the storm should blow over. On the queen's arrival at Edinburgh, a privy council was instantly called, in which the conspirators were charged to appear as guilty of murder and treason; their places of strength were ordered to be rendered up to the officers of the crown; and their estates and possessions were made liable to confiscation and forfeiture. 653 The re...lious n...arded... traitor...

But while the queen was thus eager to punish the conspirators, she was sensible that so many of the nobility, by uniting in a common cause, might raise a powerful party in opposition to her; for which reason she endeavoured to detach the earl of Murray from the rest, by making him offers of pardon. Sir James Melvil accordingly pledged himself to produce his pardon and that of his adherents, if he would separate from Morton and the conspirators. He accordingly became cold and distant to them, and exclaimed against the murder as a most execrable action; but notwithstanding his affected anger, when the conspirators fled to England, he furnished them with letters of recommendation to the earl of Bedford. After the flight of the conspirators, the king thought it necessary for him to deny his having any share in the action. He therefore embraced an opportunity of declaring to the privy council his total ignorance of the conspiracy agaist Rizzio; and not satisfied with this, he, by public proclamations at the market place of his capital, and over the whole kingdom, protested to the people at large that he had never bestowed upon it, in any degree, the sanction of his command, consent, assistance, or approbation. 654 Shame... prevari...tion of... king.

In the mean time the queen granted a full and ample pardon to the earls of Murray, Argyll, Glencairn, and Rothes, and their adherents; but towards the conspirators she remained inexorable. This lenity, to Murray especially, proved a source of the greatest inquietude to the queen; for this nobleman, blind to every motive of action distinct from his own ambition, began to contrive new plots, which though disappointed for a time, soon operated to the destruction of the queen, and almost to the ruin of the nation. 655 Murray and som... others ... the reb... are par...ed.

In 1566, the queen was delivered of a prince, who received the name of *James*. This happy event, however did not extinguish the quarrel betwixt her and the king. His desire to intrude himself into her authority, and to fix a stain upon her honour, his share in the murder of Rizzio, and his extreme meanness in publicly denying it afterwards, could not fail to impress her with the strongest sentiments of detestation and contempt. Unable, however, totally to divest herself of regard for him, her behaviour, though cold and distant, was yet decent and respectful. Castlenau, at this time ambassador extraordinary from France, conceived that a reconciliation might be effected, and employed himself some time in this friendly office. Nor were his endeavours altogether ineffectual. The king and queen spent two nights together; and proceeded in company with each other, to Meggatland in Tweeddale, in order to enjoy the diversion of the chase, attended by the earls of Huntley, Bothwel, Murray, and other nobles. From thence 656 Birth o... James V... 657 A parti... reconci...tion be...tween t... king an... queen.

thence they passed to Edinburgh, and then took the road to Stirling. Had the king been endowed with any prudence, he would have made the best use of this opportunity to have regained the affections of his queen; but, instead of this, finding that he was not immediately intrusted with power, his peevishness suggested to him a design of going abroad. To Monsieur du Croc, the French resident, who had attended Mary at Stirling, he ventured to communicate his chimerical project. This statesman represented to him its wildness and inefficacy; and could hardly believe that he was serious. To his father the earl of Lenox, who paid him a visit at this place immediately upon Mary's departure from it, he likewise communicated his intention; and all the entreaties, arguments, and remonstrances of this nobleman to make him drop his design, were without success. He provided a vessel, and kept it in readiness to carry him from his dominions. The earl of Lenox, after returning to Glasgow, where he usually resided, gave way to his paternal anxieties, and solicited the queen by letter to interfere with her authority and persuasions; and upon the evening of the day in which she received this despatch, the king alighted at Holyroodhouse. But the names of the nobles who were with the queen being announced to him, he objected to three of them, and insisted that they should be ordered to depart, before he would enter within the gates of the palace. The queen, alarmed with a demeanour so rude and so unwarrantable, condescended to leave her company and her palace to meet him; and it was with great difficulty that she was able to entice him into her own apartment. There he remained with her during the night. She communicated to him his father's letter, and employed every art and blandishment to engage him to explain his perverse design. But he gave her no return or satisfaction. He was unmoved with her kindness; and his silence, dejection, and peevishness, augmented her distress. In the morning, she called her privy council to assemble in the palace, and invited to her Monsieur du Croc the French envoy. By the bishop of Ross she explained the intention of the king, and made known the despatch of the earl of Lenox. The privy council were urgent to know the reasons of a voyage that appeared to them so inexplicable; and earnestly pressed the king to unbosom himself. If his resolution proceeded from discontent, and if there were persons in the kingdom who had given him causes of offence, they assured him, that they were ready, upon his information, to take the necessary steps to make him easy and happy. No quality or rank should exempt those from inquiry and punishment who had committed misdemeanors against him. This, they said, consisted with his honour, with the honour of the queen, and with their own. If, however, he had received no sufficient provocation to justify his behaviour, and if he had no title to complain of actual injuries, they admonished him to remember, that his flight from a queen so beautiful, and from a kingdom so ancient and noble, would expose him to the greatest ridicule and disgrace. They pointed out the happiness of his fortune, and counselled him not to part lightly with all its flattering advantages. The queen herself, taking his hand into her's, and pressing it with affection, besought him to say by what act or deed she had unfortunately induced him to conceive so fatal a purpose. Her memory did not reproach her with any crime or indiscretion which affected his honour or her integrity; yet if, without any design upon her part, she had incurred his displeasure, she was disposed to atone for it; and she begged him to speak with entire freedom, and not in any degree to spare her. Monsieur de Croc then addressed him, and employed his interest and persuasions to make him reveal his inquietudes. But all this respectful attention and ceremonious duty were ineffectual. Obstinately froward, he refused to confess that he intended any voyage, and made no mention of any reasons of discontent. He yet acknowledged with readiness, that he could not with justice accuse the queen of any injury or offence. Oppressed with uneasiness and perturbation, he prepared to retire; and, turning to her, said "Adieu, Madam! you shall not see me for a long time." He then bowed to the French envoy, and to the lords of the privy council.

He hastened back to Stirling, leaving the queen and her council in surprise and astonishment. They resolved to watch his motions with anxiety, and could not conjecture what step he would take. Mary, to prevent the effect of rumours to her disadvantage, despatched a courier to advertise the king of France and the queen-mother of his conduct. It was not possible that a prince so meanly endowed with ability could make any impression upon her allies. Nor did it appear to be in his power to excite any domestic insurrection or disturbance. He was universally odious; and, at this time, the queen was in the highest estimation with the great body of her subjects. After passing some days at Stirling, he addressed a letter to the queen, in which, after hinting at his design of going abroad, he insinuated his reasons of complaint. He was not trusted by her with authority, and she was no longer studious to advance him to honour. He was without attendants; and the nobility had deserted him. Her answer was sensible and temperate. She called to his remembrance the distinctions she had conferred upon him, the uses to which he had put the credit and reputation accruing from them, and the heinous offences he had encouraged in her subjects. Though the plotters against Rizzio had represented him as the leader of their enterprise, she had yet abstained from any accusation of him, and had even behaved as if she believed not his participation in the guilt of that project. As to the defects of his retinue, she had uniformly offered him the attendance of her own servants. As to the nobility, they were the supports of the throne, and independent of it. Their countenance was not to be commanded, but won. He had discovered too much stateliness to them; and they were the proper judges of the deportment that became them. If he wished for consequence, it was his duty to pay them court and attention; and whenever he should procure and conciliate their regard and commendation, she would be happy to give him all the importance that belonged to him.

In the mean time, the earls of Murray and Bothwel were industriously striving to widen the breach between the king and queen, and at the same time to foment the division between the king and his nobles. The earl of Morton excited disturbances on the borders; and as no settled peace had taken place there since Mary's marriage, there was the greatest reason to believe that he would succeed in his attempts. Proclamations

clamations were therefore issued by the queen to call her subjects to arms; and she proceeded to Jedburgh, to hold justice courts, and to punish traitors and disorderly persons. In the course of this journey she was taken dangerously ill; insomuch that, believing her death to be at hand, she called for the bishop of Ross, telling him to bear witness, that she had persevered in that religion in which she had been nourished and brought up; taking the promise of her nobles, that after her death they would open her last will and testament, and pay the respect to it that consisted with the laws; recommending to them the rights of her infant son, and the charge of educating him in such a manner as might enable him to rule the kingdom of his ancestors with honour; and entreating them to abstain from all cruelty and persecution of her Roman Catholic subjects. Notwithstanding her apprehensions, however, and the extreme violence of her distemper, the queen at last recovered perfect health. As soon as she was able to travel, she visited Kelso, Wark castle, Hume, Langton, and Wedderburn. The licentious borderers, on the first news of her recovery, laid down their arms. Being desirous to take a view of Berwick, the queen advanced to it with an attendance of 1000 horse. Sir John Forster, the deputy warden of the English marches, came forth with a numerous retinue, and conducted her to the most proper station for surveying it, and paid her all the honours in his power, by a full discharge of the artillery, and other demonstrations of joy. Continuing her journey, she passed to Eymouth, Dunbar, and Tantallon; proceeding thence to Craigmillar castle, where she proposed to remain till the time of the baptism of the prince, which was soon to be celebrated at Stirling.

660 ...kindness ...he king. During the severe sickness of the queen, her husband kept himself at a distance: but when she was so far recovered as to be out of danger, he made his appearance; and being received with some coldness and formality, he retired suddenly to Stirling. This cruel neglect was a most sensible mortification to her; and while she suffered from his ingratitude and haughtiness, she was not without suspicions that he was attempting to disturb the tranquillity of her government. She was seized with a settled melancholy; and, in her anguish, often wished for death to put a period to her existence. Her nobles, who were caballing against her, remarked her condition, and took advantage of it. Bothwel, who had already recommended himself by his services, redoubled his efforts to heighten the favour which these services had induced her to conceive for him. At this time, it is probable, he sought to gain the affection of the queen, with a view to marry her himself, providing a divorce from her husband could be obtained, which was now become the subject of consultation by Murray and his associates. After much deliberation, the queen herself was acquainted with this project; and it was told her, that provided she would pardon the earl of Morton and his associates, the means should be found of effectuating the divorce. This was urged as a matter of state by the earls of Murray, Lethington, Argyll, and Huntley; and the queen was invited to consider it as an affair which might be managed without any interference on her part. The queen replied, that she would listen to them, upon condition that the divorce could be obtained according to the laws, and that it should not be any way prejudicial to her son: but if they meant to operate their purpose by a disregard to these points, they must not think any more of it; for rather than consent to their views, she would endure all the torments, and abide by all the perils, to which her situation exposed her.

(Margin: 659 ... falls ..., but ...overs. — 661 Divorce propos...)

Lethington upon this, in the name of the rest, engaged to make her quit of her husband, without prejudice to her son; words which could not be understood otherwise than as pointing at murder. Lord Murray (added he), who is here present, scrupulous as he is, will connive; and behold our proceedings without opening his lips. The queen immediately made answer, "I desire that you will do nothing from which any stain may be fixed upon my honour or conscience: and I therefore require the matter to rest as it is, till God of his goodness send relief: What you think to be of service to me may turn out to my displeasure and harm."

It appears, however, that from this moment a plot was formed by Murray, Bothwel, and Lethington, against the life of Darnley, and by some of them probably against the queen herself; and that Morton, who with the other conspirators against Rizzio had received a pardon, was closely associated with them in their nefarious designs. That profligate peer was, in his way to Scotland, met at Whittingham by Bothwel and the secretary. They proposed to him the murder of the king, and required his assistance, alleging that the queen herself consented to the deed; to which Morton by his own account replied, that he was disposed to concur, provided he was sure of acting under any authority from her; but Bothwel and Lethington having returned to Edinburgh, on purpose to obtain such an authority, sent him back a message, That the queen would not permit any conversation upon that matter.

In the mean time, preparations were made for the baptism of the young prince; to assist at which the queen left Craigmillar and went to Stirling. The ceremony was performed on the 17th of December 1566. After the baptismal rites were performed, the name and titles of the prince were three times proclaimed by the heralds to the sound of trumpets. He was called and designed, Charles James, James Charles, prince and steward of Scotland, duke of Rothesay, earl of Carrick, lord of the Isles, and baron of Renfrew. Amidst the scenes of joy displayed on this occasion, the king showed his folly more than he had done before. As Elizabeth did not mean to acknowledge him in his sovereign capacity, it was neither consistent with the dignity of the queen, nor his own, that he should be present at the baptism. He did not indeed present himself either at the ceremony or the entertainments and masquerades with which it was accompanied. At this juncture, however, though he had often kept at a greater distance before, he took up his residence at Stirling, as if he had meant to offend the queen, and to expose their quarrels to the world. Du Croc, who was inclined to be favourable to him, was so struck with the impropriety of his behaviour, that he affected to have instructions from France to avoid all intercourse with him: and when the king proposed to pay him a visit, he took the liberty to inform him, that there were two passages in his chamber; and that if his majesty

(Margin: 6... Absu... havi... the l...)

majesty should enter by the one, he should be constrainged to go out by the other.

While he resided at Stirling, the king chiefly confined himself to his chamber. His strange behaviour to the queen did not give the public any favourable idea of him; and as the earl of Murray and his faction took care to augment the general odium, no court was paid to him by foreign ambassadors. His situation, therefore, was exceedingly uncomfortable; but though he must have been conscious of his imprudence and folly, he did not alter his conduct. In a sullen humour he left Stirling, and proceeded to Glasgow. Here he fell sick, with such symptoms as seemed to indicate poison. He was tormented with violent pains, and his body was all covered over with pustules of a bluish colour; so that his death was daily expected. Mary did not repay his coldness to her by negligence. She set out immediately for Glasgow, and waited on him with all the assiduity of an affectionate wife, until he recovered: after which she returned with him to Edinburgh; and as the low situation of the palace of Holyroodhouse was thought to render it unhealthy, the king was lodged in a house which had been appointed for the superior of the church, called *St Mary's in the Fields*. This house stood upon a high ground, and in a salubrious air; and here she staid with him some days.—Here the conspirators thought proper to finish their plot in the most execrable manner. On the 10th of February 1567, about two o'clock in the morning, the house where the king resided was blown up by gunpowder. The explosion alarming the inhabitants, excited a general curiosity, and brought multitudes to the place from whence it proceeded. The king was found dead and naked in an adjoining field, with a servant who used to sleep in the same apartment with him. On neither was there any mark of fire or other external injury.

The queen was in the palace of Holyroodhouse taking the diversion of a masked ball, which was given to honour the marriage of a favourite domestic, when the news of the king's death was brought to her. She showed the utmost grief, and appeared exasperated to the last degree against the perpetrators of a deed at once so shocking and barbarous. The most express and peremptory orders were given to inquire after the perpetrators by every possible method. A proclamation was issued by the privy council, assuring the people, that the queen and nobility would leave nothing undone to discover the murderers of the king. It offered the sum of 2000l. and an annuity for life, to any person who should give information of the devisers, counsellors, and perpetrators of the murder; and it held out this reward, and the promise of a full pardon, to the conspirator who should make a free confession of his own guilt, and that of the confederates. On the fourth day after this proclamation was published, a placard was affixed to the gate of the city-prison, affirming, that the earl of Bothwel, James Balfour, David Chalmers, and black John Spence, were the murderers. No name, however, was subscribed to this intelligence, nor was any demand made for the proffered reward; so that it was difficult to know whether this advertisement had been dictated by a spirit of calumny or the love of justice.

In the mean time, the earl of Murray conducted himself with his usual circumspection and avarice. Upon a pretence that his wife was dangerously sick at his castle in Fife, he, the day before the murder, obtained the queen's permission to pay a visit to her. By this means he proposed to prevent all suspicion whatever of his guilt. He was so full, however, of the intended project, that while he was proceeding on his journey, he observed to the person who accompanied him, "This night, before morning, the lord Darnley shall lose his life." When the blow was struck, he returned to Edinburgh to carry on his practices. Among foreign nations, the domestic disputes of the queen and her husband being fully known, it was with the greater ease that reports could be propagated to her disadvantage. To France letters were despatched expressing, in fervent terms, her participation in the murder. In England, the ministers and courtiers of Elizabeth could not flatter that princess more agreeably, than by industriously detracting from the honour and the virtue of the Scottish queen. Within her own dominions a similar spirit of outrage exerted itself, and not without success. As her reconciliation with her husband could not be unknown to her own subjects, it was interpreted to be dissimulation and treachery. The Protestant clergy, who were her most determined enemies, possessed a leading direction among the populace; and they were the friends and the partizans of the earl of Murray. Open declamations from the pulpit were made against Bothwel, and strong insinuations and biting surmises were thrown out against the queen. Papers were dispersed, making her a party with Bothwel in the murder. Every art was employed to provoke the frenzy of the people. Voices, interrupting the silence of the night, proclaimed the infamy of Bothwel; and portraits of the regicides were circulated over the kingdom.

666 Strong presumptions of the guilt of the earl of Murray.

667 He accuses the queen.

668 The queen determines to find and punish the murderers.

The queen's determination, however, to scrutinize into the matter was unabated: and to the earl of Lennox, the king's father, she paid an attention which he could only have expected from her upon an emergency of this kind. Having pressed her by letter to the most diligent inquiry after the regicides, she returned an answer so completely to his wishes, that he was fully convinced of the sincerity and rigour with which she intended to proceed against them: and he urged her to assemble the three estates, that their advice might direct the order and manner of their trial. She wrote to him, that an assembly of the states was already proclaimed; and that it was her earnest and determined will and purpose, that no step should be neglected that could conduce to the advancement and execution of justice. Yielding to his anxieties, he addressed her anew, entreating that the trial might not be delayed; observing, that it was not a matter of parliamentary inquiry; advising, that it would be more proper to proceed to it with the greatest expedition; and urging her to commit to prison all the persons who had been named and described in the papers and placards which had been set up in the public places of the city. The queen informed him, that although she had thought it expedient to call a meeting of the parliament at this juncture, it was not her meaning that the proceedings against the regicides should be delayed till it was actually assembled. As to the placards and papers to which he alluded, they were so numerous and contradictory, that

that she could not well determine upon which to act: but if he would condescend to mention the names which, in his opinion, were most suspicious, she would instantly command that those steps should be taken which the laws directed and authorized. He in return named the earl of Bothwel, James Balfour, David Chalmers, black John Spence, Francis Sebastian, John de Bordeaux, and Joseph the brother of David Rizzio; and assured her majesty, that his suspicions of these persons were weighty and strong. In reply to his information, Mary gave him her solemn promise, that the persons he had pointed out should abide and undergo their trial in conformity to the laws, and that they should be punished according to the measure of their guilt: and she invited him to leave immediately his retirement, and to meet her at her court, that he might witness the proceedings against them, and the zeal with which she was animated to perform the part that became her.

While the queen carried on this correspondence with the earl of Lennox, she resided partly at the palace of the lord Seton, at the distance of a few miles from her capital, and partly at Holyroodhouse. By the time that she sent her invitation to him, she was residing in her capital. She delayed not to confer with her counsellors, and to lay before them the letters of the earl of Lenox. Bothwel was earnest in his protestations of innocence; and he even expressed his wish for a trial, that he might establish his integrity. No facts pointed to his guilt; there had appeared no accuser but the earl of Lenox; and no witnesses had been found who could establish his criminality. Her privy council seemed to her to be firmly persuaded that he was suffering under the malice of defamation. Murray, Morton, and Lethington, whatever might be their private machinations, were publicly his most strenuous defenders; and they explained the behaviour of the earl of Lenox to be the effect of hatred and jealousy against a nobleman who had outrun him so far in the career of ambition. But though all the arts of Murray and Bothwel, Morton and Lethington, were exerted to their utmost extent to mislead the queen, they were not able to withhold her from adopting the strain of conduct which was the most proper and the most honourable to her. It was her own ardent desire that the regicides should be punished: she had given her solemn promise to the earl of Lenox, that the persons whom he suspected should be prosecuted; and amidst all the appearances in favour of Bothwel, and all the influence employed to serve him, it is to be regarded as a striking proof of her honour, vigour, and ability, that she could accomplish this measure. An order, accordingly, of the privy council was made, which directed, that the earl of Bothwel, and all the persons named by Lenox, should be brought to trial for the murder of the king, and that the laws of the land should be carried into full execution. The 12th of April was appointed for the trial. A general invitation was given to all persons whatsoever to prefer their accusations. The earl of Lenox was formally cited to do himself justice, by appearing in the high court of justiciary, and by coming forward to make known the guilt of the culprits.

In the mean time, it was proper to repress that spirit of outrage that had manifested itself against the queen. No discoveries, however, were made, except against James Murray, brother to Sir William Murray of Tullibardin, who at different times had published placards injurious to her. He was charged to appear before the privy-council: but refusing to obey its citation, it was made a capital offence for any commander of a vessel to convey him out of the kingdom; and the resolution was taken to punish him with an exemplary severity. Effecting, however, his escape, he avoided the punishment due to his repeated and detestable acts of calumny and treason.

The day for the trial of Bothwel approached. The conspirators, notwithstanding their power, were not without apprehensions. Their preparations, however, for their safety had been anxious; and, among other practices, they neglected not to attempt to throw a panic into the earl of Lenox. They were favoured by his consciousness of his unpopularity, and his want of strength, by his timidity and his spirit of jealousy. Suspicions of the queen's guilt were insinuated into him; and the dangers to which he might be exposed by insisting on the trial were set before him in the strongest colours. He was sensible of her aversion to him; and his weakness and the sovereign authority were contrasted. His friends concurred with his enemies to intimidate him, from the spirit of flattery, or from a real belief that his situation was critical. By the time he had reached Stirling, in his way to Edinburgh, his fears predominated. He made a full stop. He was no longer in haste to proceed against the regicides. He addressed a letter to the queen, in which he said he had fallen into such sickness, that he could not travel; and he affirmed, that he had not time to prepare for the trial and to assemble his friends. He complained, too, that Bothwel and his accomplices had not been committed to custody; he insisted, that this step should be taken; and he requested, that a day at a greater distance might be appointed for the trial. After the lengths to which matters had gone, this conduct was most improper; and it is only to be accounted for from terror or capriciousness. His indisposition was affected; he had been invited by Mary to wait upon her at Edinburgh at an early period, to concert his measures; and the delay he asked was in strong contradiction to his former entreaties. After the invitation sent to him, he might have relied with safety upon the protection of the queen, without any gathering of his friends; from the time of her private intimation to him, and of the legal citations of her officers, there had passed a period more than sufficient for the purpose of calling them together; and indeed to suppose that there was any necessity for their assistance, was an insult to government, and a matter of high indecency. There was more justice in the complaint, that the earl of Bothwel and his accomplices had not been taken into custody; and yet even in this peculiarity, he was himself to blame in a great degree. For he had not observed the precaution of that previous display of evidence, known in the Scottish law under the term of a precognition, which is common in all the grosser offences, and which the weighty circumstances of the present case rendered so necessary as a foundation for the confinement and conviction of the criminals.

An

An application for the delay of a trial so important, upon the night immediately preceding the day stated
73 for it, and reciting reasons of no conclusive force, could not with propriety be attended to. The privy-council refused the demand of the earl of Lenox. The court of justiciary was assembled. The earl of Argyll acted in his character of lord high justiciar; and was aided by four assessors, Robert Pitcairn, commendator of Dunfermline, and the lord Lindsay, with Mr James Macgill and Mr Henry Balnaves, two lords of the session. The indictment was read, and the earls of Bothwell and Lenox were called upon; the one as the defender, the other as the accuser. Bothwel, who had come to the court with an attendance of his vassals, and a band of mercenary soldiers, did not fail to present himself: but Lenox appeared only by his servant Robert Cunnyngham; who, after apologizing for his absence from the shortness of the time, and the want of the presence of his friends, desired that a new day should be appointed for the trial; and protested that if the jury should now enter upon the business, they would incur the guilt of wilful error, and their verdict be of no force or authority.

This remonstrance and protestation appeared not to the court of sufficient importance to interrupt the trial. They paid a greater respect to the letters of the earl of Lenox to the queen insisting upon an immediate prosecution, and to the order of the privy-council consequent upon them. The jury who consisted of men of rank and condition, after considering and reasoning upon the indictment for a considerable time, were unani-
74 mous in acquitting Bothwel of all share and knowledge of the king's murder. The machinations however of Morton, which we have mentioned in the life of Mary, were so apparent, that the earl of Caithness, the chancellor of the assize, made a declaration in their name and his own, that no wilful error ought to be imputed to them for their verdict; no proof, vouchers, or evidence, to confirm or support the criminal charge having been submitted to them. At the same time, he offered a protestation for himself, that there was a mistake in the indictment, the 9th day of February instead of the 10th being expressed in it as the date of the murder. It is not to be doubted, but that this flaw in the indictment was a matter of design, and with a view to the advantage of Bothwel, if the earl of Lenox had made his appearance against him. And it has been remarked as most indecent and suspicious, that soldiers in arms should have accompanied him to the court of justice; that during the trial, the earl of Morton stood by his side to give him countenance and to assist him; and that the four assessors to the chief justiciar were warm and strenuous friends to the earl of Murray.

Immediately after his trial, Bothwel set up in a conspicuous place a writing, subscribed by him, challenging to single combat, any person of equal rank with himself, who should dare to affirm that he was guilty of the king's murder. To this challenge an answer was published, in which the defiance was accepted upon the condition that security should be given for a fair and equal conflict; but no name being subscribed to this paper it was not understood to correspond with the law of arms; and of consequence no step was taken for the fighting of the duel. Two days after the parliament met, and there the party of Bothwel appeared equally formidable. The verdict in his favour was allowed to be true and just. He was continued in his high offices; and obtained a parliamentary ratification of the place of keeper of Dunbar castle, with the estates in connexion with it; and other favours were conferred upon Murray, with the rest of the nobles suspected as accomplices in the murder.

A very short time after the final acquitment of Bothwel, he began to give a greater loose to his ambition, and conceived hopes of gaining the queen in marriage. It has been already remarked, that he had insidiously endeavoured to gain her affection during the lifetime of her husband: but though he might have succeeded in this, the recent death of the king in such a shocking manner, and the strong suspicions which must necessarily still rest upon him, notwithstanding the trial he had undergone, necessarily prevented him from making his addresses openly to her. He therefore endeavoured to gain the nobility over to his side; which having done one by one, by means of great promises, he invited them to an entertainment, where they agreed to ratify a deed pointing him out to the queen as a person worthy of her hand, and expressing their resolute determination to support him in his pretensions. This extraordinary bond was accordingly executed; and Murray's name was first in the list of subscribers, in order to decoy others to sign after him; but that he might appear innocent of what he knew was to follow, he had before any use was made of the bond, asked and obtained the queen's permission to go to France. In his way thither he visited the court of Elizabeth, where he did not fail to confirm all the reports which had arisen to the disadvantage of Mary; and he now circulated the intelligence that she was soon to be married to Bothwel. Her partizans in England were exceedingly alarmed; and even Queen Elizabeth herself addressed a letter to her, in which she cautioned her not to afford such a mischevious handle to the malice of her enemies.

Mary, upon the dissolution of the parliament, had gone to Stirling to visit the young prince. Bothwel armed with the bond of the nobles, assembled 1000 horse under the pretext of protecting the borders, of which he was the warden; and meeting her upon her return to her capital, dismissed her attendants, and carried her to his castle at Dunbar. The arts which he used there to effect the accomplishment of his wishes we have mentioned under another article, (See Mary). But having been married only six months before to Lady Jane Gordon, sister to the earl of Huntley, it was necessary to procure a divorce before he could marry the queen. This was easily obtained. The parties were cousins within the prohibited degrees, and had not obtained a dispensation from Rome. Their marriage, therefore, in the opinion of the queen and her Roman Catholic subjects, was illicit, and a profane mockery of the sacrament of the church. The husband had also been unfaithful; so that two actions of divorce were instituted. The lady commenced a suit against him in the court of the commissaries, charging him as guilty of adultery with one of her maids. The earl himself brought a suit against his wife before the court of the archbishop of St Andrew's upon the plea of consanguinity.

guinity. By both courts their marriage was decided to be void; and thus two sentences of divorce were pronounced.

Bothwel now conducted the queen from Dunbar to her capital. But instead of attending her to her palace of Holyrood-house, his jealousy and apprehensions induced him to lodge her in the castle of Edinburgh, where he could hold her in security against any attempt of his enemies. To give satisfaction, however, to her people, and to convince them that she was no longer a prisoner, a public declaration upon her part appeared to be a measure of expediency. She presented herself, therefore, in the court of session; the lords chancellor and president, the judges, and other persons of distinction, being present. After observing that some stop had been put to the administration of justice upon account of her being detained at Dunbar against her will by the Lord Bothwel, she declared, that though she had been highly offended with the outrage offered to her, she was yet inclined to forget it. His courteousness, the sense she entertained of his past services to the state, and the hope with which she was impressed of his zeal and activity for the future, compelled her to give him and his accomplices in her imprisonment a full and complete pardon. She at the same time desired them to take notice, that she was now at her freedom and liberty; and that she proposed, in consideration of his merits, to take an early opportunity of promoting him to new and distinguished honours.

680 ...s of mar- ...pro- ...ced.

It was understood that the queen was immediately to advance him to be her husband. The order was given for the proclamation of the banns; and Mr John Craig, one of the ministers of Edinburgh, was desired to perform this business. But though the order was subscribed by the queen, he refused absolutely his compliance without the authority of the church. The brethren, after long reasonings, granted him permission to discharge this duty. His scruples, notwithstanding, and delicacy, were not yet removed. He protested, that, in obeying their desire, he should be allowed to speak his own sentiments concerning the marriage, and that his publishing the banns should infer no obligation in him to officiate in the solemnity. In his congregation, accordingly, before a crowded audience, and in the presence of several noblemen and privy-counsellors, he declared that the marriage of the queen and the earl of Bothwel was unlawful, and that he was prepared to give his reasons for this opinion to the parties themselves. He added, that if leave to do this was denied him, he would either abstain altogether from proclaiming the banns, or take the liberty, after proclaiming them, to inform his people of the causes of his disapprobation of the marriage. He was carried before the lords of the privy-council; and the earl of Bothwel called upon him to explain his behaviour. He answered, that the church had prohibited the marriage of persons separated for adultery; and that the divorce between him and his wife must have been owing to collusion; since the sentence had been given with precipitation, and since his new contract was so sudden; and he objected to him the abduction and ravishment of the queen, and the suspicion of his guilt in the king's murder. This bold language drew no reply from Bothwel that was satisfactory to Mr Craig, or that could intimidate him. He proclaimed in his church the banns of the marriage; but he told the congregation, that he discharged the suggestions of his conscience in pronouncing it to be a detestable and scandalous engagement. He expressed the sorrow he felt for the conduct of the nobility, who seemed to approve it from their flattery or silence: and addressing himself to the faithful, he besought them to pray to the Almighty that he would turn a resolution intended against law, reason, and religion, into a comfort and benefit to the church and the kingdom. These freedoms were too great to pass unnoticed. Mr Craig was ordered anew to attend the privy-council; and he was reprimanded with severity for exceeding the bounds of his commission. He had the courage to defend himself. His commission, he said, was founded in the word of God, positive law, and natural reason; and upon the foundation of these topics he was about to prove that the marriage must be universally foul and odious, when the earl of Bothwel commanded him to be silent. The privy-council, struck with the vigour of the man, and apprehensive of the public discontents, did not dare to inflict any punishment upon him; and this victory over Bothwel, while it heightened all the suspicions against him, served to encourage the enemies of the queen, and to undermine the respect of her subjects.

681 ...inde Mr John ...g.

Mary, before she rendered her hand to Bothwel, created him duke of Orkney. The ceremony was performed in a private manner, after the rules of the Popish church; but, to gratify the people, it was likewise solemnized publicly according to the Protestant rites by Adam Bothwel bishop of Orkney, an ecclesiastic who had renounced the Episcopal order for the Reformation. It was celebrated with little pomp and festivity. Many of the nobles had retired to their seats in the country; and those who attended were thoughtful and sad. Du Croc, the French ambassador, sensible that the match would be displeasing to his court, refused to give his countenance to the solemnity. There were no acclamations of the common people. Mary herself was not unconscious of the imprudence of the choice she had made, and looked back with surprise and sorrow to the train of circumstances which had conducted her to this fatal event. Forsaken by her nobles, and imprisoned at Dunbar, she was in so perilous a situation that no remedy could save her honour but death. Her marriage was the immediate and necessary consequence of that situation (s). It was the point

6... The ...riag ...brate

(s) "The queen (says Melvil) could not but marry him; seeing he had ravished her and lain with her against her will." Memoirs, p. 159. In the following passage, from a writer of great authority, in our history, this topic is touched with no less exactness, but with greater delicacy. After Mary had remained a fortnight under the power of a daring profligate adventurer, says Lord Hailes, few foreign princes would have solicited her hand.

point for which her enemies had laboured with a wicked and relentless policy.

Mary was unfortunate in her second marriage, but much more so in her third. Bothwell had neither talents for business nor affection for his wife. Ambitious and jealous to the last degree, he sought only to establish himself in power, while his fears and jealousies made him take the most improper means. The marriage had already thrown the nation into a ferment; and the least improper exercise of power, or indeed an appearance of it, even on the part of the queen, would be sufficient to ruin them both for ever. Perhaps the only thing which at this juncture could have pacified the people, would have been the total abolition of

83 Popery, which they had often required. But this was not thought of. Instead of taking any step to please the people, Bothwel endeavoured to force the earl of Marr to deliver up the young prince to his custody.—This was sufficient to make the flame, which had hitherto been smothered, break out with all its violence. It was universally believed that Bothwel, who had been the murderer of the father, designed to take away the life of the son also, and the queen was thought to participate in all his crimes. The earl of Murray now

84 took advantage of the queen's unfortunate situation to aggrandize himself and effect her ruin. After having visited the English court, he proceeded to France, where he assiduously disseminated all the reports against the queen which were injurious to her reputation; and where, without being exposed to suspicion, he was able to maintain a close correspondence with his friends Morton and Lethington, and to inspirit their machinations. His associates, true to his ambition and their own, had promoted all the schemes of Bothwel upon the queen with a power and influence which had ensured their success. In confederacy with the earl of Murray himself, they had conspired with him to murder the king. Assisted with the weight of the earl of Murray, they had managed his trial, and operated the verdict which acquitted him. By the same arts, and with the same views, they had joined with him to procure the bond of the nobles recommending him to the queen as a husband, asserting his integrity and innocence, recounting his noble qualities, expressing an unalterable resolution to support the marriage against every opposer and adversary, and recording a wish that a defection from its objects and purposes should be branded with everlasting ignominy, and held out as a most faithless and perjured treachery. When the end, however, was accomplished for which they had been so zealous, and when the marriage of the queen was actually celebrated, they laid aside the pretence of friendship, and were in haste to entitle themselves to the ignominy which they had invited to fall upon them. The murder of the king, the guilt of Bothwell, his acquittal, his divorce, and his marriage, became the topics of their complaints and declamation. Upon the foundation of this hated marriage, they even ventured privately to infer the privity of the queen to all his iniquity and transactions; and this step seemed doubtless, to the mass of her own subjects and to more distant observers, a strong confirmation of all the former suspicions to her shame which had been circulated with so much artifice. Their imputations and devices excited against her, both at home and abroad, the most indignant and humiliating odium. Amidst the ruins of her fame, they thought to bury for ever her tranquillity and peace; and in the convulsions they had meditated, they already were anticipating the downfal of Bothwel, and snatching at the crown that tottered on her head.

68 A con[s]piracy f[ormed] against Bothw[el].

But while this cabal were prosecuting their private ends, several noblemen, not less remarkable for their virtue than their rank, were eager to vindicate the national integrity and honour. The earl of Athol, upon the king's murder, had retired from the court, and was waiting for a proper season to take revenge upon the regicides. The earl of Marr, uneasy under the charge of the young prince, was solicitous to make himself strong, that he might guard him from injury. Motives so patriotic and honourable drew applause and partizans. It was sufficient to mention them. By private conference and debate, an association was insensibly formed to punish the murderers of the king, and to protect the person of the prince. Morton and Lethington encouraged and promoted a combination from which they might derive so much advantage. A convention accordingly was appointed at Stirling, for the purpose of consulting upon the measures which it was most expedient to pursue. They agreed to take an early opportunity to appear in the field; and when they separated, it was to collect their retainers, and to inspirit their passions.

Of this confederacy, the leading men were the earls of Argyll, Athol, Morton, Marr, and Glencairn; the lords Hume, Semple, and Lindsay; the barons Kirkaldy of Grange, Murray of Tullibardin, and Maitland of Lethington. The earl of Bothwel was sensible, that if he was to sit upon a throne, he must wade to it through blood. By his advice, two proclamations were issued in the name of the queen, under the pretence of suppressing insurrections and depredations upon the borders. By the former, she called together in arms, upon an early day, the earls, barons, and freeholders of the districts of Forfar and Perth, Strathern and Menteith, Clackmannan, Kinross, and Fife. By the latter she charged the greater and lesser baronage, with all the inferior proprietors of the shires of Linlithgow and Edinburgh, and the constabulary of Haddington and Berwick, to prepare immediately for war, and to keep themselves in readiness to march upon her order. These military preparations admonished the association to be firm and active, and added to the public inquietudes and discontents. The rumours against the queen were most violent and loud. It was said, that she meant

6[9] The q[ueen] prepa[res] for w[ar].

---

hand. Some of her subjects might still have sought that honour; but her compliance would have been humiliating beyond measure. It would have left her at the mercy of a capricious husband; it would have exposed her to the disgrace of being reproached, in some sullen hour, for the adventure at Dunbar. Mary was so situated, at this critical period, that she was reduced to this horrid alternative; either to remain in a friendless and hazardous celibacy, or to yield her hand to Bothwel." Remarks on the History of Scotland, p. 204.

to overturn the constitution and the laws; that she had been careless of the health of her son, and was altogether indifferent about his preservation; that she had separated herself from the councils and assistance of her nobles; and that she wished to make her whim or discretion the only rule of her government. Agitated with the hazardous state of her affairs, she published a new proclamation, in which she employed herself to refute these accusations; and in which she took the opportunity to express, in a very forcible manner, not only her attachment to her people and the laws, but the fond affection that she bore to the prince, whom she considered as the chief joy of her life, and without whom all her days would be comfortless.

The declarations of the queen were treated with scorn. The nobles, abounding in vassals, and having the hearts of the people, were soon in a situation to take the field. They were advancing to the capital. The royal army was not yet assembled; and the queen and Bothwel suspected that the castle of Edinburgh would shut its gates upon them. The fidelity of Sir James Balfour the deputy-governor had been staggered by the practices of the earl of Marr and Sir James Melvil. Mary left her palace of Holyroodhouse, and was conducted to Borthwick castle. The associated lords, informed of her flight, took the road to this fortress with 2000 horse. The lord Hume, by a rapid march, presented himself before it with the division under his command: but being unable to guard all its avenues, the queen and Bothwel effected their escape to Dunbar; where the strength of the fortifications gave them a full security against a surprise.

Upon this second disappointment, the nobles resolved to enter Edinburgh, and to augment their strength by new partizans. The earl of Huntley and the lord Boyd were here on the side of the queen, with the archbishop of St Andrew's, the bishop of Ross, and the abbot of Kilwinning. They endeavoured to animate the inhabitants to defend their town and the cause of their sovereign. But the tide of popularity was favourable to the confederated lords. The magistrates ordered the gates of the city to be shut; but no farther resistance was intended. The lords, forcing St Mary's port, found an easy admittance, and took possession of the capital. The earl of Huntley and the queen's friends fled to the castle, to Sir James Balfour, who had been the confidant of Bothwel, and who agreed to protect them, although he was now concluding a treaty with the insurgents.

The associated lords now formed themselves into a council, and circulated a proclamation. By this paper they declared, that the queen being detained in captivity, was neither able to govern her realm, nor to command a proper trial to be taken of the king's murder. In an emergency so pressing, they had not despaired of their country; but were determined to deliver the queen from bondage, to protect the person of the prince, to revenge the murder of the king, and to vindicate the nation from the infamy it had hitherto suffered through the impunity of the regicides. They therefore commanded in general all the subjects of Scotland whatsoever, and the burgesses and inhabitants of Edinburgh in particular, to take a part with them, and to join in the advancement of purposes so beneficial and salutary. The day after they had published this proclamation, they issued another in terms that were stronger and more resolute. They definitively expressed their persuasion of Bothwel's guilt in the rape and seduction of the queen, and in his perpetration of the king's murder, in order to accomplish his marriage. They inculcated it as their firm opinion, that Bothwel was now instigated with a design to murder the young prince, and that he was collecting troops with this view. Addressing themselves, therefore, to all the subjects of the realm, whether they resided in counties or in boroughs, they invited them to come forward to their standard; and desired them to remember, that all persons who should presume to disobey them should be treated as enemies and traitors.

Bothwel, in the mean time, was not inactive; and the proclamations of the queen had brought many of her vassals to her assistance. Four thousand combatants ranged themselves on her side. This force might augment as she approached to her capital; and Bothwel was impatient to put his fortunes to the issue of a battle. He left the strong castle of Dunbar, where the nobles were not prepared to assail him, and where he might have remained in safety till they dispersed themselves. For their proclamations were not so successful as they had expected; their provisions and stores were scanty; and the zeal of the common people, unsupported by prosperity, would soon have abated. Imprudent precipitation served them in a most effectual manner. When the queen had reached Gladsmuir, she ordered a manifesto to be read to her army, and to be circulated among her subjects. By this paper, she replied to the proclamations of the confederated nobles, and charged them with treachery and rebellion. She treated their reasons of hostility as mere pretences, and as inventions which could not bear to be examined. As to the king's murder, she protested, that she herself was fully determined to revenge it, if she could be so fortunate as to discover its perpetrators. With regard to the bondage from which they were so desirous to relieve her, she observed, that it was a falsehood so notorious, that the simplest of her subjects could confute it; for her marriage had been celebrated in a public manner, and the nobles could hardly have forgotten that they had subscribed a bond recommending Bothwel to be her husband. With regard to the industrious defamations of this nobleman, it was urged, that he had discovered the utmost solicitude to establish his innocence. He had invited a scrutiny into his guilt; the justice of his country had absolved him; the three estates assembled in parliament were satisfied with the proceedings of his judges and jury; and he had offered to maintain his quarrel against any person whatsoever who was equal to him in rank and of an honest reputation. The nobles, she said, to give a fair appearance to their treason, pretended, that Bothwel had schemed the destruction of the prince, and that they were in arms to protect him. The prince, however, was actually in their own custody; the use they made of him was that of a skreen to their perfidiousness; and the real purposes with which they were animated, were the overthrow of her greatness, the ruin of her posterity, and the usurpation of the royal authority. She therefore entreated the aid of her faithful subjects; and as the prize of their valorous service, she held out to them the estates and possessions of the rebels.

The

The associated nobles, pleased at the approach of the queen, put themselves in motion. In the city of Edinburgh they had gathered an addition to their forces; and it happened that the Scottish officer who commanded the companies, which, in this period, the king of Denmark was permitted to enlist in Scotland, had been gained to assist them. He had just completed his levies; and he turned them against the queen. The nobles, after advancing to Musselburgh, refreshed their troops. Intelligence was brought that the queen was upon her march. The two armies were nearly equal in numbers; but the preference in point of valour and discipline, belonged decisively to the soldiers of the nobles. The queen posted herself on the top of Carberry hill. The lords taking a circuit to humour the ground, seemed to be retreating to Dalkeith; but wheeling about, they approached to give her battle. They were ranged in two divisions. The one was commanded by the earl of Morton and the lord Hume. The other was directed by the earls of Athol, Marr, and Glencairn, with the lords Lindsay, Ruthven, Sempil, and Sanquhar. Bothwel was the leader of the royal forces; and there served under him the lords Seton, Yester, and Borthwick.

691 It was not without apprehensions that Mary surveyed the formidable appearance of her enemies. Du Croc, the French ambassador, hastened to interpose his good offices and to attempt an accommodation. He assured the nobles of the peaceful inclinations of the queen; and that the generosity of her nature disposed her not only to forgive their present insurrection, but to forget all their former transgressions. The earl of Morton informed him, that they had not armed themselves against the queen, but against the murderer of the late king; and that if she would surrender him up to them, or command him to leave her, they would consent to return to their duty. The earl of Glencairn desired him to observe, that the extremity to which they had proceeded might have instructed him that they meant not to ask pardon for any offence they had committed, but that they were resolved to take cognizance of injuries which had provoked their displeasure. This aspiring language confounded Du Croc, who had been accustomed to the worshipful submissions that are paid to a despot. He conceived that all negotiation was fruitless, and withdrew from the field in the expectation that the sword would immediately give its law and determine every difference.

Mary was full of perturbation and distress. The state into which she had been brought by Bothwel did not fail to engage her serious reflection. It was with infinite regret that she considered the consequences of her situation at Dunbar. Nor had his behaviour since her marriage contributed to allay her inquietudes. The violence of his passions, his suspicions, and his guilt, had induced him to surround her with his creatures, and to treat her with insult and indignity. She had been almost constantly in tears. His demeanour, which was generally rude and indecent, was often savage and brutal. At different times his provocations were so insulting that she had even attempted to arm her hand against her life, and was desirous of relieving her wretchedness by spilling her blood. Upon this account, she was now encompassed with dangers. Her crown was in hazard. Under unhappy agitations, she rode through the ranks of her army, and found her soldiers dispirited. Whatever respect they might entertain for her, they had none for her husband. His own retainers and dependents only were willing to fight for him. He endeavoured to awaken the royal army to valour, by throwing down the gauntlet of defiance against any of his adversaries who should dare to encounter him. His challenge was instantly accepted by Kirkaldy of Grange, and by Murray of Tullibardin. He objected that they were not peers. The lord Lindsay discovered the greatest impatience to engage him, and his offer was admitted; but the queen interposing her prerogative, prohibited the combat. All the pride and hopes of Bothwel sunk within him. His soldiers in small parties were secretly abandoning their standards. It was equally perilous for the queen to fight or to fly. The most prudent expedient for her was to capitulate. She desired to confer with Kirkaldy of Grange, who remonstrated to her, against the guilt and wickedness of Bothwel, and counselled her to abandon him. She expressed her willingness to dismiss him upon the condition that the lords would acknowledge their allegiance and continue in it. Kirkaldy passed to the nobles, and received their authority to assure her that they would honour, serve, and obey her as their princess and sovereign. He communicated this intelligence to her. She advised Bothwel to provide for his safety by flight; and Kirkaldy admonished him not to neglect this opportunity of effecting his escape. Overwhelmed with shame, disappointment, terror, remorse, and despair, this miserable victim of ambition and guilt turned his eyes to her for the last time. To Kirkaldy of Grange she stretched out her hand: he kissed it; and taking the bridle of her horse, conducted her towards the nobles. They were approaching her with becoming reverence. She said to them, "I am come my lords, to express my respect, and to conclude our agreement; I am ready to be instructed by the wisdom of your counsels; and I am confident that you will treat me as your sovereign." The earl of Morton, in the name of the confederacy, ratified their promises, and addressed her in these words: "Madam, you are here among us in your proper place; and we will pay you as much honour, service, and obedience, as ever in any former period was offered by the nobility to the princes your predecessors."

This gleam of sunshine was soon overcast. She remained not many hours in the camp, till the common soldiers instigated by her enemies, presumed to insult her with the most unseemly reproaches. They exclaimed indignantly against her as the murderer of her husband. They reviled her as a lewd adulteress in the most open manner, and in a language the most coarse and the most opprobrious. The nobility forgot their promises, and seemed to have neither honour nor humanity. She had changed one intolerable scene for a distress that was deeper and more hopeless. They surrounded her with guards, and conducted her to her capital. She was carried along its streets, and shown to her people in captivity and sadness. She cried out to them to commiserate and protect her. They withheld their pity, and afforded her no protection. Even new insults were offered to her. The lowest of the populace, whom the declamations of the clergy had driven into rage and madness, vied with the soldiery in the licentious

centious outrage of invective and execration. She besought Maitland to solicit the lords to repress the insupportable atrocity of her treatment. She conjured him to let them know, that she would submit herself implicitly to the determination of the parliament. Her entreaties and her sufferings made no impression upon the nobles. They continued the savage cruelty of their demeanour. She implored, as the last request she would prefer to them, that they would lead her to her palace. This consolation, too, was refused to her. They wished to accustom her subjects to behold her in disgrace, and to teach them to triumph over her misfortunes. In the most mortifying and affecting hour she had ever experienced, oppressed with fatigue, and disfigured with dust and sorrow, they shut her up in the house of the lord provost: leaving her to revolve in her anxious and agitated mind the indignities she had already endured, and to suffer in anticipation the calamities they might yet inflict upon her.

The malice of Morton and his adherents was still far from being gratified. In the morning when the queen looked from the window of the apartment to which she had been confined, she perceived a white banner displayed in such a manner as to fix her attention. There was delineated upon it the body of the late king stretched at the foot of a tree, and the prince upon his knees before it, with a label from his mouth, containing this prayer, "Judge and revenge my cause, O Lord!" This abominable banner revived all the bitterness of her afflictions. The curiosity of the people drew them to a scene so new and so affecting. She exclaimed against the treachery of her nobles; and she begged the spectators to relieve her from their tyranny. The eventful story of the preceding day had thrown her capital into a ferment. The citizens of a better condition crowded to behold the degraded majesty of their sovereign. Her state of humiliation, so opposite to the grandeur from which she had fallen, moved them with compassion and sympathy. They heard her tale, and were filled with indignation. Her lamentations, her disorder, her beauty, all stimulated their ardour for her deliverance. It was announced to the nobles, that the tide of popular favour had turned towards the queen. They hastened to appear before her, and to assure her, with smiles and courtesy, that they were immediately to conduct her to the palace, and to reinstate her in her royalty. Imposing upon her credulous nature, and that beautiful humanity which characterized her even in the most melancholy situations of her life, they prevailed with her to inform the people, that she was pacified, and that she wished them to disperse themselves. They separated in obedience to her desire. The nobles now conveyed her to Holyroodhouse. But nothing could be farther from their intentions than her re-establishment in liberty and grandeur. They held a council, in which they deliberated concerning the manner in which they ought to dispose of her. It was resolved, that she should be confined during her life in the fortress of Lochleven; and they subscribed an order for her commitment.

A resolution so sudden, so perfidious, and so tyrannical, filled Mary with the utmost astonishment, and drew from her the most bitter complaints and exclamations. Kirkaldy of Grange, perceiving with surprise the lengths to which the nobles had proceeded, felt his honour take the alarm for the part he had acted at their desire. He expostulated with them upon their breach of trust, and censured the extreme rigour of the queen's treatment. They counselled him to rely upon the integrity of their motives; spoke of her passion for Bothwel as most vehement, and insisted on the danger of intrusting her with power. He was not convinced by their speeches; and earnestly recommended lenient and moderate measures. Discreet admonitions, he said, could not fail of impressing her with a full sense of the hazards and inconveniences of an improper passion, and a little time would cure her of it. They assured him, that when it appeared that she detested Bothwel, and had utterly abandoned his interests, they would think of kindness and moderation. But this, they urged, could hardly be expected; for they had recently intercepted a letter from her to this nobleman, in which she expressed, in the strongest terms, the warmth of her love, and her fixed purpose never to forsake him (T). Kirkaldy was desired to peruse this letter; and he pressed them no longer with his remonstrances. The queen, in the mean time, sent a message to this generous soldier, complaining of the cruelty of her nobles, and reminding him that they had violated their engagements. He instantly addressed an answer to it, recounting the reproaches he had made to them; stating his advice; describing the surprise with which he had read her intercepted letter; and conjuring her to renounce and forget a most wicked and flagitious man, and, by this victory over herself, to regain the love and respect of her

(T) "Mr Hume is candid enough to give up the authenticity of this letter; and indeed, so far as I have observed, there is not the slightest pretence of a reason for conceiving it to be genuine; (*Hist. of England*, Vol. V. p 120.) It was not mentioned by the earl of Morton and his adherents to Throgmorton, when Elizabeth interfered in the affairs of Scotland upon the imprisonment of the queen in the castle of Lochleven: a period of time when these statesmen were desirous to throw out every imputation to her prejudice, and when in particular they were abusing her with vehemence for her attachment to Bothwel; (*Keith*, p. 419.) Nor was it made use of by Murray before the English commissioners. Mary, in the condition to which the nobles had reduced her, could not well think of a step of this sort, although her attachment to Bothwel had been as strong as they were pleased to pronounce it. For, not to speak of the greatness of her distress, she was guarded by them so strictly, as to make it vain for her to pretend to elude their vigilance. In regard, too, to her love of Bothwel, it is not clear that it was ever real. While the king was alive, there are no traces of their improper intercourse. The affair of Dunbar was a criminal seduction. The arts of a profligate man overcame her. There was no sentiment of love upon either side. After her marriage, his rudeness extinguished in her altogether any remain of kindness and respect; and hence the coldness with which she parted with him." *Stuart's History of Scotland*, Vol. I. p. 253. note.

4

her subjects. The device of a letter from her to Bothwel completed the amazement of the queen. So unprincipled a contempt of every thing that is most sacred, so barbarous a perseverance in perfidiousness and injustice, extinguished every sentiment of hope in her bosom. She conceived that she was doomed to inevitable destruction, and sunk under a pang of unutterable anguish.

The lords Ruthven and Lindsay arrived in this paroxysm of her distress, to inform her, that they were commanded to put in execution the order for her commitment. They charged her women to take from her all her ornaments and her royal attire. A mean dress was put upon her; and in this disguise they conveyed her with precipitation to the prison appointed for her. The lords Seton, Yester, and Borthwick, endeavoured to rescue her, but failed in the attempt. She was delivered over to William Douglas the governor of the castle of Lochleven, who had married the mother of the earl of Murray, and was himself nearly related to the earl of Morton. See MARY.

Upon the same day on which the nobles subscribed the order for the imprisonment of the queen, they entered into a bond of concurrence or confederacy. By this deed they bound and cemented themselves into a body for the strenuous prosecution of their quarrel; and it detailed the purposes which they were to forward and pursue. They proposed to punish the murderers of the king, to examine into the queen's rape, to dissolve her marriage, to preserve her from the bondage of Bothwel, to protect the person of the prince, and to restore justice to the realm. The sanction of a most solemn oath confirmed their reliance upon one another; and in advancing their measures, they engaged to expose and employ their lives, kindred, and fortunes.

It is easy to see, notwithstanding all the pretended patriotism of the rebels, that nothing was farther from their intentions than to prosecute Bothwel and restore the queen to her dignity. They had already treated her in the vilest manner, and allowed Bothwel to escape when they might easily have apprehended and brought him to any trial they thought proper. To exalt themselves was their only aim. Eleven days after the capitulation at Carberry hill, they held a convention, in which they very properly assumed the name of *lords of the secret council*, and issued a proclamation for apprehending Bothwel as the murderer of the king; offering a reward of 1000 crowns to any person who should bring him to Edinburgh. A search had been made for the murderers of the king that very night in which the queen was confined in Lochleven castle. One Sebastian a Frenchman, and Captain Blackader, were then apprehended; and soon after James Edmondstone, John Blackader, and Mynart Fraser, were taken up and imprisoned. The people expected full and satisfactory proofs of the guilt of Bothwel, but were disappointed. The affirmation of the nobles, that they were possessed of evidence which could condemn him, appeared to be no better than a pretence or artifice. Sebastian found means to escape; the other persons were put to the torture, and sustained it without making any confession that the nobles could publish. They were condemned, however, and executed, as being concerned in the murder. In their dying moments they protested their innocence. A sanguine hope was entertained that Captain Blackader would reveal the whole secret at the place of execution, and a vast multitude of spectators were present. No information, however, could be derived from what he said with regard to the regicides; but while he solemnly protested that his life was unjustly taken away, he averred it as his belief that the earls of Murray and Morton were the contrivers of the king's murder.

704 Robber[illegible] and ou[illegible]rages o[illegible] confede[illegible]ed lord[illegible]

The lords of the secret council now proceeded to the greatest enormities. They robbed the palace of Holyroodhouse of its furniture and decorations; converted the queen's plate into coin: and possessed themselves of her jewels, which were of great value; and while the faction at large committed these acts of robbery, the earl of Glencairn with solemn hypocrisy demolished the altar in the queen's chapel, and defaced and destroyed all its pictures and ornaments. These excessive outrages, however, lost them the favour of the people, and an association was formed in favour of the queen. The court of France, as soon as the news of Mary's imprisonment arrived, despatched M. de Villeroy to condole with her upon her misfortunes: but the lords of the secret council would not admit him to see her, upon which he immediately returned to his own country. The earl of Murray, however, was at this time in France; and to the promises of this ambitious and treacherous wretch the king trusted, imagining him to be a steady friend to the unfortunate queen. Elizabeth also pretended friendship, and threatened the associated lords; but as they had every reason to doubt her sincerity, they paid no regard to her threats, and even refused to admit her ambassador to Mary's presence.

70[illegible] Mary [illegible]pelled [illegible] sign a[illegible] signati[illegible] of her crown

From all these appearances of friendship Mary neither did nor could derive any real assistance. On the 24th of July 1567, the lord Lindsay, whose imperious behaviour, says Dr Stuart, approached to insanity, was ordered by the lords to wait upon the queen at Lochleven. He carried with him three deeds or instruments, and was instructed not to be sparing in rudeness and menaces in order to compel her to subscribe them. By the first, she was to resign her crown to her infant-son; by the second, she appointed the earl of Murray regent of Scotland; and by the third, she constituted a council to direct the prince till this nobleman should arrive in Scotland, or in the event of his death or refusal of the office. On the part of the queen all resistance was vain. Sir Robert Melvil assured her, that her best friends were of opinion, that what she did by compulsion, and in a prison, could have no power to bind her; and of this she was also assured by Throgmorton, the English ambassador, in a letter which Sir Robert Melvil brought in the scabbard of his sword. Mary therefore, forlorn and helpless, could not resist the barbarous rudeness with which Lindsay pressed the subscription of the papers, though she would not read them. Five days after, the lords of the secret council met at Stirling, for the coronation of the young prince, and considered themselves as representing the three estates of the kingdom. A protestation was made in the name of the duke of Chatelherault, that this solemnity should neither prejudge his rights of succession nor those of the other princes of the blood. The young prince being presented to them, the lords Lindsay and Ruthven appeared, and in the name of the queen renounced in his favour her right and title to the crown, gave up the papers

70[illegible] Coron[illegible] of Jan[illegible] VI.

papers she had subscribed, and surrendered the sword, sceptre, and royal crown. After the papers were read, the earls of Morton, Athol, Glencairn, Marr, and Menteith, with the master of Graham, the lord Hume, and Bothwel bishop of Orkney, received the queen's resignation in favour of her son in the name of the three estates. After this formality, the earl of Morton, bending his body, and laying his hand upon the Scriptures, took the coronation oath for the prince, engaging that he should rule according to the laws, and root out all heretics and enemies to the word of God. Adam Bothwel then anointed the prince king of Scotland; a ceremony with which John Knox was displeased, as believing it to be of Jewish invention. This prelate next delivered to him the sword and the sceptre, and finally put the crown upon his head. In the procession to the castle from the church, where the inauguration was performed, and where John Knox preached the inauguration sermon, the earl of Athol carried the crown, Morton the sceptre, Glencairn the sword, and the earl of

7 prov-

Marr carried the prince in his arms. These solemnities received no countenance from Elizabeth; and Throg-

eth.

morton, by her express command, was not present at them.

8 y re- rom .

Soon after this ceremony, the earl of Murray returned from France; and his presence gave such a strength and firmness to his faction, that very little opposition could be given by the partisans of Mary, who were unsettled and desponding for want of a leader. A little

9 s a o the at ven,

time after his arrival, this monstrous hypocrite and traitor waited upon his distressed and insulted sovereign at Lochleven. His design was to get her to desire him to accept of the regency, which he otherwise pretended to decline. The queen, unsuspicious of the deepness of his arts, conscious of the gratitude he owed to her, and trusting to his natural affection, and their tie of a common father, received him with a tender welcome. She was in haste to pour forth her soul to him; and with tears and lamentations related her condition and her sufferings. He heard her with attention: and turned occasionally his discourse to the topics which might lead her to open to him her mind without disguise in those situations in which he was most anxious to observe it. His eye and his penetration were fully employed; but her distress awakened not his tenderness. He seemed to be in suspense; and from the guardedness of his conversation she could gather neither hope nor fear. She begged him to be free with her, as he was her only friend. He yielded to her entreaties as if with pain and reluctance; and taking a comprehensive survey of her conduct, described it with all the severity that could affect her most. He could discover no apology for her misgovernment and disorders; and, with a mortifying plainness, he pressed upon her conscience and her honour. At times she wept bitterly. Some errors she confessed; and against calumnies she warmly vindicated herself. But all she could urge in her behalf made no impression upon him; and he spoke to her of the mercy of God as her chief refuge. She was torn with apprehensions, and nearly distracted with despair. He dropped some words of consolation; and after expressing an attachment to her interests, gave her his promise to employ all his consequence to secure her life. As to her liberty, he told her, that to achieve it was beyond all his efforts; and that it was not good for her to desire it. Starting from her seat, she took him in her arms, and kissing him as her deliverer from the scaffold, solicited his immediate acceptance of the regency. He declared he had many reasons to refuse the regency. She implored and conjured him not to abandon her in the extremity of her wretchedness. There was no other method, she said, by which she herself could be saved, her son protected, and her realm rightly governed. He gave way to her anxiety and solicitations. She besought him to make the most unbounded use of her name and authority, desired him to keep for her the jewels that yet remained with her, and recommended it to him to get an early possession of all the forts of her kingdom. He now took his leave of her, and embracing anew this pious traitor, she sent her blessing with him to the prince her son.

710 and in- duces h to pres him to cept of regency

711 Misera fate of Bothwe

In the mean time the wretched earl of Bothwel was struggling with the greatest difficulties. Sir William Murray and Kirkaldy of Grange had put to sea in search of him. He had been obliged to exercise piracy in order to subsist himself and his followers. His pursuers came upon him unexpectedly at the Orkney islands, and took three of his ships; but he himself made his escape. Soon after, having seized a Turkish trader on the coast of Norway, two ships of war belonging to the king of Denmark gave chase to him as a pirate. An engagement ensued, in which Bothwel was taken. His officers and mariners were hanged in Denmark; but Bothwel himself, being known by some Scottish merchants, had his life spared. He was thrown, however, into a dungeon, where he remained ten years; and at last died melancholy and distracted. The regent sent commissioners to the king of Denmark to demand him as a prisoner; but that prince, considering him as a traitor and usurper, totally disregarded his request.

712 Letters forged between Mary a Bothwe

The dreadful fate of Bothwel did not make any alteration in the situation of the queen. Her enemies, bent on calumniating her, produced letters, which they said were written and sent by her to that licentious nobleman during the life of the king. These letters are now universally admitted to have been forged by the rebels themselves, who practised likewise upon some servants of Bothwel to accuse the queen of the murder of her husband. The letters for some time gained credit;

713 Servant Bothwe execute who de the inno cence o queen.

but the confessions of the servants were all in her favour. When on the scaffold, they addressed themselves to the people; and after having solemnly declared the innocence of the queen, they protested before God and his angels, that the earl of Bothwel had informed them that the earls of Murray and Morton were the contrivers of the king's murder.

It was impossible that such transactions as these could advance the popularity of the regent. His unbounded ambition and cruelty to his sovereign began at last to open the eyes of the nation; and a party was forming itself in favour of the queen. She herself had been often meditating her escape from her prison; and she at

714 The qu escapes from pr son.

last effected it by means of a young gentleman, George Douglas, brother to her keeper, who had fallen in love with her. On the 2d day of May 1568, about seven o'clock in the evening, when her keeper was at supper with his family, George Douglas, possessing himself of the keys of the castle, hastened to her apartment, and conducted her out of prison. Having locked the gates

of

of the castle, they immediately entered a boat which waited for them; and being rowed across the lake, the lord Seton received the queen with a chosen band of horsemen in complete armour. That night he conveyed her to his house of Niddrie in West Lothian; where having rested a few hours, she set out for Hamilton.

15 The escape of the queen threw her enemies into the greatest consternation. Many forsook the regent openly; and still more made their submissions privately, or concealed themselves. He did not, however, despond; but resolved to defend himself by force of arms. The queen soon found herself at the head of 6000 men, and the regent opposed her with 4000. Mary, however, did not think it proper to risk a battle; knowing the capacity of the regent as a general, and that his officers were all men of approved valour and experience. But in this prudent resolution she was over-ruled by the impetuosity of her troops. A battle was fought on
6 the 13th of May 1568, at Langside near Glasgow; in which Mary's army was defeated, and her last hopes blasted. The unfortunate queen fled towards Kirkcudbright; where finding a place of safety, she deliberated on the plan she should afterwards follow. The result of her deliberations, as frequently happens in cases of perplexity, led her to take the worst step possible. Notwithstanding all the perfidy which she had found in Elizabeth, Mary could not think that she would now refuse to afford her a refuge in her dominions; and there-
7 fore determined to retire into England. To this she had been solicited by Elizabeth herself during her confinement in Lochleven castle; and she now resolved, in opposition to the advice of her most faithful counsellors, to make the fatal experiment.

8 In obedience to her order, the lord Herries addressed a letter to Mr Lauder, the deputy-commander at Carlisle; and after detailing her defeat at Langside, desired to know if she might trust herself upon English ground. This officer wrote instantly an answer, in which he said, that the lord Scroop the warden of the frontiers being absent, he could not of his private authority give a formal assurance in a matter which concerned the state of a queen: but that he would send by post to his court to know the pleasure of his sovereign; and that if in the mean time any necessity should force Mary to Carlisle, he would receive her with joy, and protect her against her enemies. Mary, however, before the messenger could return, had embarked in a fishing boat with sixteen attendants. In a few hours she landed at Wirkington in Cumberland; and from thence she proceeded to Cockermouth, where she continued till Mr Lauder, having assembled the gentlemen of the country, conducted her with the greatest respect to the castle of Carlisle.

9 To Elizabeth she announced her arrival in a despatch, which described her late misfortunes in general and pathetic terms, and in which she expressed an earnest solicitude to pay her a visit at her court, and the deep sense she entertained of her friendship and generosity. The queen of England, by obliging and polite letters, condoled with her upon her situation, and gave her assurances of all the favour and protection that were due to the justice of her cause. But as they were not accompanied with an invitation to London, Mary took the alarm. She thought it expedient to instruct Lord Fleming to repair to France; and she intrusted Lord Herries with a most pressing remonstrance to Elizabeth. Her anxiety for an interview in order to vindicate her conduct, her ability to do so in the most satisfactory manner, and her power to explain the ingratitude, the crimes, and the perfidy of her enemies, were urged to this princess. A delay in the state of her affairs was represented as nearly equivalent to absolute destruction. An immediate proof was therefore requested from Elizabeth of the sincerity of her professions. If she was unwilling to admit into her presence a queen, a relation, and a friend, she was reminded, that as Mary's entrance into her dominions had been voluntary, her departure ought to be equally free and unrestrained. She valued the protection of the queen of England above that of every other potentate upon earth; but if it could not be granted, she would solicit the amity, and implore the aid, of powers who would commiserate her afflictions, and be forward to relieve them. Amidst remonstrances, however, which were so just and so natural, Mary failed not to give thanks to Elizabeth for the courtesy with which she had hitherto been treated in the castle of Carlisle. She took the opportunity also to beg of this princess to avert the cruelty of the regent from her adherents, and to engage him not to waste her kingdom with hostility and ravages; and she had the prudence to pay her compliments in an affectionate letter to Secretary Cecil, and to court his kind offices in extricating her from her difficulties and troubles. 72

721 But the queen of England was not to be moved by remonstrances. The voluntary offer of Mary to plead her cause in the presence of Elizabeth, and to satisfy all her scruples, was rejected. Her disasters were rather a matter of exultation than of pity. The deliberations of the English queen, and those of her statesmen, were not directed by maxims of equity, of compassion, or of generosity. They considered the flight of Mary into England as an incident that was fortunate and favourable to them; and they were solicitous to adopt those measures which would enable them to draw from it the greatest profit and advantage. If the queen of Scots were allowed to return to her own dominions, it was probable that she would soon be in a condition to destroy the earl of Murray and his faction, who were the friends of England. The house of Hamilton, who were now zealous in the interests of France, would rise into consideration and power. England would be kept in perpetual turmoils upon the frontiers; Ireland would receive molestation from the Scots, and its disturbances grow important and dangerous. Mary would renew with redoubled ardour her designs against the Protestant religion; and a French army would again be introduced into Scotland. For these reasons, Elizabeth and her ministers determining not to restore the queen of Scots to her throne, considered what would be the probable consequences of permitting her to remain at liberty in England. In this situation, she would augment the number of her partizans, send to every quarter her emissaries, and inculcate her title to the crown. Foreign ambassadors would afford her aid, and take a share in her intrigues; and Scotland, where there was so high an object to be gained, would enter with cordiality into her views. This plan being also hazarduus, it was deliberated whether the

queen of Scots, might not be allowed to take a voyage into France. But all the pretenſions which had hitherto threatened the crown of Elizabeth would in this caſe be revived. A ſtrong reſentment to her would even urge Mary and Charles IX. to the boldeſt and moſt deſperate enterpriſes. The party of the queen of Scots in England, ſtrong from motives of religion and affection, and from diſcontents and the love of change, would ſtimulate their anger and ambition. England
722 had now no territories in France. A war with that country and with Scotland would involve the greateſt dangers. Upon revolving theſe meaſures and topics, Elizabeth and her counſellors were induced to conclude, that it was by far the wiſeſt expedient to keep the queen of Scots in confinement, to invent methods to augment her diſtreſs, to give countenance to the regent, and to hold her kingdom in dependence and ſub-
723 jection.

In conſequence of this cruel and unjuſt reſolution, Mary was acquainted, that ſhe could not be admitted into Elizabeth's preſence till ſhe had cleared herſelf of the crimes imputed to her; ſhe was warned not to think of introducing French troops into Scotland; and it was hinted, that for the more ſecurity ſhe ought to be removed farther from the frontier. This meſſage at once ſhowed Mary the imprudence of her conduct in truſting herſelf to Elizabeth. But the error could not now be remedied. She was watched to prevent her eſcape, and all her remonſtrances were vain. The earl of Murray had offered to accuſe her; and it was at laſt concluded that Elizabeth could not, conſiſtently with her own honour and the tranquillity of her government, ſuffer the queen of Scots to come into her preſence, to depart out of England, or to be reſtored
724 to her dignity, till her cauſe ſhould be tried and decided. An order was given to remove her from Carliſle caſtle to a place of ſtrength at a greater diſtance from the borders, to confine her more cloſely, and to guard againſt all poſſibility of an eſcape.

In conſequence of theſe extraordinary tranſactions, a trial took place, perhaps the moſt remarkable for its injuſtice and partiality of any recorded in hiſtory. Mary, confined and apprehenſive, ſubmitted to be tried as they thought proper. The regent, who was to be the accuſer, was ſummoned into England, and commiſ-
725 ſioners were appointed on both ſides. On the 4th of October, the commiſſioners met at York; and four days after, the deputies of the queen of Scots were called to make known their complaints. They related the moſt material circumſtances of the cruel uſage ſhe had received. Their accuſations were an alarming introduction to the buſineſs in which the regent had embarked; and notwithſtanding the encouragement ſhown to him by Elizabeth, he was aſſaulted by apprehenſions. The artifices of Maitland added to his alarms. In-
726 ſtead of proceeding inſtantly to defend himſelf, or to accuſe the queen, he ſought permiſſion to relate his doubts and ſcruples to the Engliſh commiſſioners. In his own name, and with the concurrence of his aſſociates, he demanded to know whether they had ſufficient authority from Elizabeth to pronounce, in the caſe of the murder, Guilty or not guilty, according to the evidence that ſhould be laid before them; whether they would actually exerciſe this power; whether, in the event of her criminality, their ſovereign ſhould be delivered to him and his friends, or detained in England in ſuch a way as that no danger ſhould enſue from her activity; and whether, upon her conviction, the queen of England would allow his proceedings, and thoſe of his party, to be proper, maintain the government of the young king, and ſupport him in the regency in the terms of the act of parliament which had confirmed him in that office. To theſe requiſitions, it was anſwered, upon the part of the Engliſh deputies, that their commiſſion was ſo ample, that they could enter into and proceed with the controverſy; and that they had liberty to declare, that their ſovereign would not reſtore the queen of Scots to her crown, if ſatisfactory proofs of her crime ſhould be produced; but that they knew not, and were not inſtructed to ſay, in what manner ſhe would finally conduct herſelf as to her perſon and puniſhment. With regard to the ſovereignty of the prince, and the regency of the earl of Murray, they were points, they obſerved, which might be canvaſſed in a future period. Theſe replies did not pleaſe the regent and his aſſociates; and they requeſted the Engliſh commiſſioners to tranſmit their doubts and ſcruples to be examined and anſwered by Elizabeth.

But while the regent diſcovered in this manner his apprehenſions, he yet affirmed that he was able to anſwer the charges imputed to him and his faction; and this being in a great meaſure a diſtinct matter from the controverſy of the murder, he was deſired to proceed in it. It was contended, that Bothwel, who had the chief concern in the murder of Lord Darnley, poſſeſſed ſuch credit with the queen, that within three months after that horrible event, he ſeized her perſon and led her captive to Dunbar, obtained a divorce from his wife, and married her: that the nobility, being moved with his crimes, did confederate to puniſh him; to relieve her from the tyranny of a man who had raviſhed her, and who could not be her huſband; and to preſerve the life of the prince: that having taken arms for theſe purpoſes, the earl marched againſt them; but that, propoſing to decide the quarrel by ſingle combat, his challenge was accepted: that he declined, notwithſtanding, to enter the liſts, and fled: that the queen, preferring his impunity to her own honour, favoured his eſcape by going over to the nobility: that they conducted her to Edinburgh, where they informed her of the motives of their proceedings, requeſted her to take the proper ſteps againſt him and the other regicides, and entreated her to diſſolve her pretended marriage, to take care of her ſon, and to conſult the tranquillity of her realm: that this treatment being offenſive to her, ſhe menaced them with vengeance, and offered to ſurrender her crown if they would permit her to poſſeſs the murderer of her huſband: that her inflexible mind, and the neceſſities of the ſtate, compelled them to keep her at a diſtance from him, and out of the way of a communication with his adherents: that during her confinement, finding herſelf fatigued with the troubles of royalty, and unfit for them from vexation of ſpirit and the weakneſs of her body and intellect, ſhe freely and of her own will reſigned her crown to her ſon, and conſtituted the earl of Murray to the regency; that the king accordingly had been crowned, and Murray admitted to the regency; that the ſanction of the three eſtates aſſembled in parliament having confirmed theſe appointments, an univerſal

verſal obedience of the people had enſued, and a ſteady adminiſtration of juſtice had taken place: that certain perſons, however, envious of the public order and peace, had brought her out of priſon, and had engaged to ſubvert the government; that they had been diſappointed in their wicked attempts; and that it was moſt juſt and equitable, that the king and the regent ſhould be ſupported in power, in oppoſition to a rebellious and turbulent faction.

This apology, ſo imperfect, ſo impudent, and ſo irreconcileable with hiſtory, received a complete confutation from the deputies of the queen of Scots. To take arms againſt her becauſe Bothwel had her favour, was, they ſaid, a lame juſtification of the earl of Murray and his friends; ſince it had never been properly manifeſted to her that he was the murderer of her huſband. He had indeed been ſuſpected of this crime; but had been tried by his peers, and acquitted. His acquittal had been ratified in parliament, and had obtained the expreſs approbation of the party who were now ſo loud in accuſing him and who had conſpired againſt her authority. Theſe rebels had even urged her to accompliſh her marriage with him, had recommended him as the fitteſt perſon to govern the realm, and had ſubſcribed a bond aſſerting his innocence, and binding themſelves to challenge and puniſh all his adverſaries and opponents. They had never, either before or after the marriage, like true ſubjects, advertiſed the queen of his guilt, till, having experience of their ſtrength, they ſecretly took arms, and inveſted her in Bothwick caſtle. The firſt mark of their diſpleaſure was the ſound of a trumpet in hoſtility, and the diſplay of warlike banners. She made her eſcape to Dunbar; and they returning to Edinburgh, levied troops, iſſued proclamations, took the field againſt her, under the pretence of delivering her from his tyranny, and got poſſeſſion of her perſon. She was willing to prevent the effuſion of blood, and was very far from preferring his impunity to her honour. Kirkaldy of Grange, in obedience to inſtructions from them, deſired her to cauſe him to retire, and invited her to paſs to them under the promiſe of being ſerved and obeyed as their ſovereign. She conſented, and Kirkaldy taking Bothwel by the hand, recommended it to him to depart, and aſſured him that no man would purſue him. It was by their own contrivance that he fled; and it was in their power to have taken him; but they ſhowed not the ſmalleſt deſire to make him their priſoner. He remained, too, for ſome time in the kingdom, and was unmoleſted by them; and it was not till he was upon the ſeas that they affected to go in ſearch of him. When ſhe ſurrendered herſelf in the ſight of their army, the earl of Morton ratified the ſtipulations of Kirkaldy, made obeiſance to her in their names, and promiſed her all the ſervice and honour which had ever been paid to any of her predeceſſors. They were not ſlaves, however, to their engagements. They carried her to Edinburgh, but did not lodge her in her palace. She was committed to the houſe of a burgeſs, and treated with the vileſt indignities. She indeed broke out into menaces, and threatened them; nor was this a matter either of blame or of wonder. But it was utterly falſe that ſhe had ever made any offer to give away her crown, if ſhe might poſſeſs Bothwel. In the midſt of her ſufferings, ſhe had even required them by Secretary Maitland to ſpecify their complaints, and beſought them to allow her to appear in parliament, and to join and aſſiſt in ſeeking a remedy to them from the wiſdom of the three eſtates. This overture, however, ſo ſalutary and ſubmiſſive, they abſolutely rejected.—They were animated by purpoſes of ambition, and had not in view a relief from grievances. They forced her from her capital in the night, and impriſoned her in Lochleven; and there, they affirm, being exhauſted with the toils of government and the languors of ſickneſs, ſhe, without conſtraint or ſolicitation, reſigned her crown to her ſon, and appointed the earl of Murray to be regent during his minority. This indeed was to aſſume an unlimited power over facts; but the truth could neither be concealed, nor overturned, nor palliated. She was in the vigour of youth, unaſſailed by maladies, and without any infirmity that could induce her to ſurrender the government of her kingdom. Nor was it unknown to them that the earl of Athol and the barons Tullibardin and Lethington, principal men of their council, deſpatched Sir Robert Melvil to her with a ring and preſents, with a recommendation to ſubſcribe whatever papers ſhould be laid before her, as the only means in her power to ſave her life, and with an aſſurance that what ſhe did under captivity could not operate any injury to her. Melvil, too, communicated to her an intimation in writing from Sir Nicholas Throgmorton, which gave her the ſame advice and the ſame aſſurance. To Sir Nicholas Throgmorton ſhe ſent an anſwer, informing him that ſhe would follow his counſel; and enjoining him to declare to his miſtreſs her hapleſs ſtate, and that her reſignation of her crown was conſtrained. Nor did this ambaſſador neglect her commiſſion; and it was a popular perſuaſion that Elizabeth would have marched an army to her relief, if ſhe had not been intimidated by the threat of the rebels, that the blood of the queen of Scots would be the wages of her ſoldiers. It was alſo not to be contradicted, that when the lord Lindſay preſented to his ſovereign the inſtruments of reſignation, he menaced her with a cloſer priſon and a ſpeedy death if ſhe ſhould refuſe to ſubſcribe them. It was under an extreme terror, and with many tears, that ſhe put her name to them. She did not conſider them as her deeds; did not read them; and proteſted, that when ſhe was at liberty, ſhe would diſavow ſubſcriptions which had been extorted from her. Even Douglas, the keeper of Lochleven, could not endure to be a witneſs of the violence employed againſt her. He departed out of her preſence, that he might not ſee her ſurrender her rights againſt her will; and he ſought and obtained from her a certificate, that he was not acceſſory to this compulſion and outrage. Nor did it conſiſt with the ſlighteſt probability or reaſon, that ſhe would, of her own will and accord, execute a reſignation of her royal eſtate, and retain no proviſion for her future maintenance. Yet by theſe extraordinary deeds, the condition to which ſhe was reduced was moſt miſerable and wretched. For no portion whatever of her revenue was reſerved to her, and no ſecurity of any kind was granted either for her liberty or her life. As to the coronation of the prince, it could have no validity, as being founded in a pretended and forced reſignation. It was alſo defective in its form; for there were in Scotland more than an hundred earls, biſhops, and lords; and of theſe the whole, or at leaſt the major part, ought

to

tland. to concur in matters of importance. Now there did not assist in it more than four earls, six lords, one bishop, and two or three abbots. Protestations, too, were openly made, that nothing transacted at that period should be any prejudice to the queen, her estate, and the blood-royal of Scotland. Neither could it be rightly conceived, that if the queen had willingly surrendered her dignities, she would have named the earl of Murray to the regency in preference to the duke of Chatelherault, who had a natural and proper claim to it, and who had deserved well of her country by discharging that high office during her minority. As to the ratification of the investiture of the young prince, and the regency of the earl of Murray, by the estates, it was observable, that this was done in an illegal parliament. It was an invalid confirmation of deeds which in themselves had no inherent power or efficacy. The principal nobility, too, objected in this parliament to this ratification. Protestations were made before the lords of the articles, as well as before the three estates, to interrupt and defeat transactions which were in a wild hostility to the constitution and the laws. Neither was it true that the government of the king and the regent was universally obeyed, and administered with equity and approbation: for a great division of the nobility never acknowledged any authority but that of the queen, and never held any courts but in her name; and it was notorious, that the administration of the usurpers had been marked and distinguished by enormous cruelties and oppressions. Many honourable families and loyal subjects had been persecuted to ruin, and plundered of their wealth, to gratify the retainers and soldiers who upheld this insolent domination; and murder and bloodshed, theft and rapine, were prevalent to a degree unheard of for many ages. Upon all these accounts, it was inferred, that Elizabeth ought to support the queen of Scots, to restore her to her crown, and to overthrow the power of a most unnatural and rebellious faction.

129 regent ...le to ... To these facts the regent did not pretend to make any objection; and though required by the English commissioners to produce sounder and better reasons for his treatment of the queen, he did not advance any thing in his own behalf. He even allowed the charges of treason and usurpation to be pressed against him, without presuming to answer. This surprising behaviour, which might readily have been construed into an acknowledgment of his guilt, it seems, proceeded from some conferences which he had with the duke of Norfolk. This nobleman was a zealous partizan for the succession of Mary to the English crown. He was strongly possessed with the opinion, that his mistress, while she was disposed to gratify her animosity and jealousies against the queen of Scots, was secretly resolved, by fixing a stain upon her, to exclude her altogether from the succession, and to involve her son in her disgrace. He was eager to defeat a purpose, which he conceived to be not only unjust in itself, but highly detrimental to his country. It was in his power to act with this view; and he observed with pleasure, that Maitland of Lethington was favourable to Mary. To this statesman, accordingly, he ventured to express his surprise, that the regent could be allured to think of an attempt so blameable as that of criminating his sovereign. If Mary had really given offence by miscarriage and mistakes, it yet was not the business of a good subject industriously to hold her out to scorn. Anxious and repeated conferences were held by them; and at length it was formally agreed, that the regent should not accuse the queen of Scots; and that the duke in return should protect him in the favour of Elizabeth, and secure him in the possession of his regency.

7.. His e... treme... dious and ... crisy. But while the regent engaged himself in this intrigue with the duke of Norfolk, he was desirous notwithstanding of gratifying the resentments of Elizabeth, and of advancing his own interests by undermining secretly the fame and reputation of his sovereign. He instructed Maitland, George Buchanan, James Macgill, and John Wood, to go to the duke of Norfolk, the earl of Sussex, and Sir Ralph Sadler, and to communicate to them as private persons, and not in their character of commissioners, the letters to Bothwel and the other proofs upon which he affirmed the guilt of the queen of Scots. It was his desire that they would examine these papers, give their opinion of them to Elizabeth, and inform him whether she judged them sufficient evidences of Mary's concern in the murder of her husband. If this should be her opinion, he testified his own readiness, and that of his associates, to swear that the papers were genuine, and of the hand-writing of the queen. By this operation, he was solicitous to establish his vouchers as incontestable, and as testimonies of record. The commissioners examined his papers, and heard the comments of Buchanan and his other assistants; but they do not seem to have bestowed the fullest credit upon them. They described them, however, to Elizabeth; pointed out the places of them which were strongest against Mary; and allowed that their force and meaning were very great, if their genuineness could be demonstrated. But of their genuineness they acknowledged that they had no other evidence than stout assertions, and the offer of oaths. The earl of Sussex, in a private despatch to Secretary Cecil, does more than insinuate *, that he thought Mary would be able to prove the letters palpable forgeries; and with respect to the murder of the king, he declares in plain terms, that from all he could learn, Murray and his faction would, upon a judicial trial, be found by "proofs hardly to be denied," more criminal in that charge than the queen herself. Elizabeth and her ministers, upon the receipt of such despatches, did not think it expedient to empower them to adopt a method of proof so palpably suspicious, and in which she could not openly concur, without grossly violating even the appearance of probity. The regent had before attempted to engage her in a direct assurance of the validity of his papers, when he submitted copies of them to her inspection by his secretary Mr Wood. His attempt at this juncture was of a similar kind; and it could not recommend him to the English commissioners.

* Rob... of D... meny... story, Book...

Nor were these the only transactions which took place during the continuance of the commissioners at York. The inventive and refining genius of Lethington had suggested to him a project, which he communicated in confidence to the bishop of Ross. It received the warm approbation of this ecclesiastic; and they determined to put it to a trial. While they attended the duke of Norfolk to the diversion of hawking, they insinuated into him the notion of his allying himself with the queen of Scots. Her beauty, her accomplishments,

nd. ment, and her kingdom, were high allurements to this nobleman; and as he was the greateſt ſubject of England, and perhaps of Europe, he ſeemed not to be unworthy of them. The propoſal was very flattering to the admiration he entertained of Mary, to his ambition, and to his patriotiſm. The more he thought of it, he was the more convinced of its propriety. His acceſs to be informed of the practices of the regent, deſtroyed in him the operation of theſe ſlanders by which her enemies were ſo active to traduce her. In this ſtate of his mind, the lady Scroop, his ſiſter, who reſided at Bolton Caſtle with Mary, completely confirmed his reſolution. For from her he learned the orderly carriage and the amiable diſpoſitions of the queen of Scots. He was now impatient to have a fit ſeaſon to make her formally the offer of his hand.

Elizabeth in the mean time was thrown into confuſion by the refuſal of the regent to accuſe the queen of Scots. To give a poſitive anſwer to his doubts and ſcruples was not conſiſtent with her honour; and yet, without this condeſcenſion, ſhe was aſſured that the Scottiſh deputies would not exhibit their charge or crimination. Having deceived Mary therefore with fair promiſes, ſhe was active in gaining over the regent to her views; which having done, he conſented at laſt to prefer his accuſation againſt Mary before the commiſſioners, who now met at Weſtminſter by the command of Elizabeth. The charge was expreſſed in general and preſumptive terms. It affirmed, that as James earl of Bothwel was the chief executor of the murder of King Henry, ſo the queen was his perſuader and counſel in the device; that ſhe was a maintainer and fortifier of this unnatural deed, by ſtopping the inquiſition into it and its puniſhment, and by taking in marriage the principal regicide; that they had begun to exerciſe a cruel tyranny in the commonwealth, and had formed a reſolution of deſtroying the innocent prince, and of transferring the crown from the true line of its kings to a bloody murderer and a godleſs tyrant; and that the eſtates of the realm, finding her unworthy to reign, had ordered her to reſign the crown, her ſon to be crowned, and the earl of Murray to be eſtabliſhed in the regency. Before this accuſation was preferred, the earl of Lenox preſented himſelf before the Engliſh commiſſioners; made a lamentable declaration of his griefs, and produced to them the letters which had paſſed between him and Mary concerning the murder, with a writing which contained a direct affirmation of her guilt.

The deputies of Mary were aſtoniſhed at this accuſation, being a violent infringement of a proteſtation which they had formerly given in, and which had been accepted, namely, that the crown, eſtate, perſon, and honour of the queen of Scots, ſhould be guarded againſt every aſſault and injury; yet in all theſe particulars ſhe was touched and affected. It was underſtood that no judicial proceedings ſhould take place againſt her; yet ſhe was actually arraigned as a criminal, and her deputies were called upon to defend her. They diſcovered not, however, any apprehenſion of the validity of the charge; and while they fully explained the motives which actuated the earl of Murray and his faction in their proceedings, they imputed to perſons among themſelves the guilt of the king's murder. They affirmed, that the queen's adverſaries were the accomplices of Bothwel; that they had ſubſcribed a bond conſpiring the death of the king; and that their guilt had been atteſted in the ſight of 10,000 ſpectators by thoſe of their confederates who had already been executed. They exclaimed againſt the enormous ingratitude, and the unparalleled audacity of men, who could forget ſo completely all the obligations which they owed to their ſovereign; and who, not ſatisfied with uſurping her power, could even charge her with a murder which they themſelves had committed. They repreſented the ſtrong neceſſity which had ariſen for the fulleſt vindication of their miſtreſs; and they ſaid, that in ſo weighty an extremity, they could not poſſibly ſuppoſe that ſhe would be reſtrained from appearing in her own defence. They had her inſtructions, if her honour was touched, to make this requiſition; and till it was granted, they inſiſted, that all proceedings in the conference ſhould be at an end. A refuſal of this liberty, in the ſituation to which ſhe was driven, would be an infallible proof that no good was intended to her. It was their wiſh to deal with ſincerity and uprightneſs; and they were perſuaded, that without a proper freedom of defence, their queen would neceſſarily fall a victim to partiality and injuſtice. They therefore earneſtly preſſed the Engliſh commiſſioners, that ſhe might be permitted to preſent herſelf before Elizabeth, the nobles of England, and the embaſſadors of foreign nations, in order to maniſeſt to the world the injuries ſhe had ſoffered, and her innocence.

733 After having made theſe ſpirited repreſentations to the Engliſh commiſſioners, the deputies of Mary deſired to have acceſs to the queen of England. They were admitted accordingly to an audience; and in a formal addreſs or petition they detailed what had happened, inſiſted that the liberty of perſonal defence ſhould be allowed to their miſtreſs, and demanded that the earl of Murray and his aſſociates ſhould be taken into cuſtody, till they ſhould anſwer to ſuch charges as ſhould be preferred againſt them. She deſired to have ſome time to turn her thoughts to matters of ſuch high importance; and told them, that they might ſoon expect to hear from her.

They are admitted to an audience by Elizabeth,

734 The biſhop of Roſs, and the other deputies of Mary, in the mean time, ſtruck with the perfidious management of the conference, convinced of the jealouſies and paſſions of Elizabeth, ſenſible that her power over her commiſſioners was unlimited, and anxious for the deliverance of their miſtreſs, made an overture for an accommodation to the earl of Leiceſter and Sir William Cecil. They propoſed, that the original meaning of the conference ſhould ſtill be adhered to, notwithſtanding the accuſation which had been preſented by the earl of Murray; and that Elizabeth, diſregarding it as an effort of faction, ſhould proceed to a good agreement between Mary and her ſubjects. For this ſcheme, which is ſo expreſſive of their ſuſpicions of Elizabeth and of her commiſſioners, they had no authority from their miſtreſs. They acknowledged accordingly, that it was made without her inſtructions, and intimated that they were moved to it by their anxiety for peace and the re-eſtabliſhment of the affairs of the Scottiſh nation. They were introduced at Hampton-court to Elizabeth; who liſtened to their motion, and was averſe from it. They then repeated the deſires of the petition they had preſented to her; but ſhe did not think

cotland. think it right that the queen of Scots should yet have the liberty to defend herself in person. She confessed, indeed, that it was reasonable that Mary should be heard in her own cause; but she affirmed, that she was at a loss at what time she should appear, in what place, and to whom she should address herself. While she let fall, however, the hope that Mary might obtain the permission so repeatedly and so earnestly requested, she expressed her resolution that the earl of Murray should first be heard in support of his charge, and that she should attend to the proofs which he affirmed himself in readiness to produce. After this business should be transacted, she told the deputies of Mary that she would again confer with them. It was to no purpose that they objected to a procedure so strange and so improper. An accusation, said they, is given; the person accused is anxious to defend herself; this privilege is denied to her; and yet a demand is to be made for the vouchers of her guilt. What is this but an open violation of justice? It did not become them to dispute her pleasure in her own dominions: but they would not, they informed her, consent to a measure which was so alarming to the interests of their queen; and if it was adopted, she might expect that a protest against its validity would be lodged with her commissioners.

-735 ameful duct of zabeth.

736 ercation ween com- sioners.

The English commissioners resumed the conference, and were about to demand from the earl of Murray the proofs with which he could support his accusation. The bishop of Ross and his associates being admitted to them, expressed themselves in conformity to the conversation they had held with Elizabeth. They declared, that it was unnatural and preposterous in their sovereign to think of receiving proofs of the guilt of the queen of Scots before she was heard in her own defence; and they protested, that in the event of this proceeding, the negotiation should be dissolved, and Elizabeth be disarmed of all power to do any prejudice to her honour, person, crown, and estate. The commissioners of the English queen were affected with this protestation, and felt more for the honour of their mistress than for their own. They refused to receive it, because there were engrossed in it the words of the refusal which Elizabeth had given to the petition for Mary. They did not chouse to authenticate the terms of this refusal by their subscriptions; and were solicitous to suppress so palpable a memorial of her iniquity. They alleged, that the language of her refusal had not been taken down with accuracy; and they pressed Mary's deputies to present a simpler form of protestation. The bishop of Ross and his colleagues yielded not, however, immediately to their insidious importunity; but, repeating anew their protestation as they had at first planned it, included the express words of Elizabeth; and, when compelled by the power of the commissioners to expunge the language of the English queen, they still insisted upon their protestation. An interruption was thus given to the validity of any future proceedings which might affect the reputation of the queen of Scots. The earls of Murray and Morton, with their friends, were very much disappointed. For they had solaced themselves with the hope of a triumph before there was a victory; and thought of obtaining a decree from Elizabeth, which while it should pronounce the queen of Scots to be an adulteress and a murderer, would exalt them into the station and character of virtuous men and honourable subjects. Scot

7 Eliza dema vouch the cr laid to ry's c

Though the conference ought naturally to have terminated upon this protestation of the deputies of Mary against the injustice of Elizabeth, yet it did not satisfy the latter princess that the accusation only had been delivered to her commissioners; she was seriously disposed to operate a judicial production of its vouchers. The charge would thus have a more regular aspect, and be a sounder foundation upon which to build, not only the infamy of the Scottish queen, but her own justification for the part she had acted. Her commissioners accordingly, after the bishop of Ross and his colleagues had retired, disregarding their protestation, called upon the earl of Murray and his associates to make their appearance. The pretence, however, employed for drawing from him his papers was sufficiently artful, and bears the marks of that systematic duplicity which so shamefully characterizes all the transactions of Elizabeth at this period. Sir Nicholas Bacon the lord keeper addressed himself to the earl of Murray. He said, that, in the opinion of the queen of England, it was a matter surprising and strange, that he should accuse his sovereign of a crime most horrible, odious to God and man, against law and nature; and which, if proved to be true, would render her infamous in all the kingdoms of the world. But though he had so widely forgot his duty, yet had not Elizabeth renounced her love of a good sister, a good neighbour, and a good friend; and it was her will, that he and his company should produce the papers by which they imagined they were able to maintain their accusation. The earl of Murray, in his turn, was not wanting in dissimulation. He expressed himself to be very sorry for the high displeasure he had given to Elizabeth by his charge against Mary, and for the obstinacy of the Scottish queen and her deputies, which made it necessary for him to vindicate himself by discovering her dishonour. Under the load of this double and affected sorrow, he made an actual and formal exhibition of the vouchers by which he pretended to fix and establish her criminality. A particular account and examination of these vouchers, the reader will find in our life of MARY, and in the works to which we have there referred.

73 Conclu of Ma trial.

To enumerate all the shifts to which Elizabeth and the adversaries of Mary were put, in order to make the strange evidence that was produced wear some degree of plausibility, would far exceed our bounds. It is sufficient to say, that after having wearied themselves with prevarication and falsehood; after having pressed Mary to abdicate her crown, a requisition with which she never would comply; and after having finally refused to hear her in her own defence; Elizabeth on the 10th of January 1569, gave leave to the earl of Murray and his accomplices to depart her dominions; telling them, that since they came into England, nothing had been objected to them which could hurt their honour as men, or affect their allegiance as subjects. At the same time she told them, that they had produced no information or evidence by which she was entitled to conceive any bad opinion of the queen of Scots. It was therefore her pleasure to allow the affairs of Scotland to continue precisely in the condition in which they were situated at the beginning of the conference. Three days

otland.

days after this, they formally took their leave of the queen of England. The deputies of Mary remonstrated, protested, and argued to no purpose; the English privy-council, with the most provoking indifference, told them, that "the earl of Murray had promised to their sovereign, for himself and his company to return to England at any time she should call upon him. But, in the mean time, the queen of Scots could not, for many strong reasons, be suffered to take her departure out of England. As to her deputies, they would move Elizabeth to allow them to return to Scotland; and they believed that she would not detain them."

Mary was exceedingly disappointed and chagrined by this singular issue of her cause. Her friends during this period had increased, and the cruel and injurious treatment she had met with was so flagrant, that the earl of Murray and his faction were apprehensive of a sudden reverse of fortune. The earls of Argyll and Huntley protested against the injustice of their proceedings, at the same time that they openly accused the earl of Murray and Maitland of Lethington as the associates of Bothwel in the murder of the king. This charge, according to the custom of the times, they offered to prove as true and certain by the law of arms; and they protested, that if their adversaries should delay to answer their challenge, they should be held as confessing themselves guilty of the murder. Elizabeth, however, foreseeing something of this kind, had dismissed Murray and his adherents with precipitation, so that there could now be no formal production of it before the English commissioners. However, it was known and published in the court of Elizabeth. Murray made an evasive reply, and Lethington made none at all.

740 ...ry com... ...ted to ...er con... ...ement.

This, however, afforded no relief to the unhappy queen of Scotland. Her inveterate and treacherous enemy held her fast, and endeavoured by every method in her power to render her life miserable. Mary, on the other hand, never lost either her spirit or her dignity. She attempted to rouse in the minds of her nobles that passion for liberty which had once so much distinguished the Scottish nation, but which now seemed to be exchanged for a servile subjection to the queen of England. But some despatches which pressed these topics being intercepted, Mary was removed from Bolton to Tutbury castle, where she was intrusted to the earl of Shrewsbury, and committed to closer confinement than she had yet experienced; while Elizabeth dispersed manifestoes all over the northern counties of England, complaining of reports injurious to her honour, and disclaiming all hostile intentions towards the liberties of Scotland.

741 ...e regent ...ores ...nself in ...wer.

In the mean time Murray returned to Scotland, where he took every method to establish himself in his ill-acquired power. Mary had commanded the duke of Chatelherault to return to Scotland, in order to raise forces for her behoof: but this nobleman had been long detained in England by the artifices of Elizabeth, so that Murray had arrived there before him. The duke, however, began to raise forces, and might have proved a troublesome antagonist, had not Murray deceived him by a pretended negotiation, and got him into his power; immediately after which he imprisoned him, and forced most of the other lords who were on that side to submit.

Scotl...

74... Negoti... tions i... Englan...

When the news of this important event reached the queen of Scots, she instructed the bishop of Ross to repair to Elizabeth, and to make remonstrances in their behalf. By the agency of this ecclesiastic, whom she had constituted her ambassador, she meant to conduct her transactions with the queen of England; and from the conclusion of the conferences, she had been meditating a proper plan upon which to accomplish her liberty and restoration. The bishop of Ross, after complaining loudly of the rigorous proceedings of the regent, and intimating the general belief which prevailed that he was supported by the English court, pressed the propriety of a final settlement of the affairs of his mistress. With this view, he was admitted by Elizabeth and her privy-counsellors to frequent conferences; and they even desired him to present to them in writing the articles which he was commanded to propose as the foundation of a treaty. He failed not to comply with this injunction; and it was the import of his schedule of agreement, that Mary should engage never to molest Elizabeth, and the lawful heirs of her body, respecting the succession to the crown of England and Ireland, if she could obtain sufficient security that upon their demise her rights would be respected: that a new treaty of alliance and friendship should be concluded between the two queens, by the advice of the estates of both kingdoms; that this league should be ratified by their oaths and seals, and confirmed by parliamentary acts; and, if any farther assurance should be deemed necessary on the part of Mary, that she would procure the kings of France and Spain to be the guarantees of her punctuality and concord; that in compliance with the pleasure of Elizabeth, she would extend her clemency to all her subjects who had offended her, under the provision that they would submit to her sovereignty, deliver up the prince her son, restore her castles, give back her jewels, and surrender to her friends and servants the estates and possessions of which they had been deprived; that the murder of the king should be punished against all the actors in it without delay, and according to the laws; that, to prevent Bothwel from returning to Scotland, and to please those who imagined that it was in his power to excite ferments and trouble, she would be bound to institute a process of divorce against him; and that these articles being adjusted, the queen of England should allow her to proceed to Scotland, under a safe and honourable convoy, to be re-established by the three estates in her realm and government, and to be gratified with the dissolution of all the acts and statutes which had been passed to her prejudice.

74... Advan... are m... in the ...jected ...riage ...Mary ...the du... Norfo...

These heads of alliance were received with a respect and cordiality which were not usually paid to the transactions of Mary in the court of Elizabeth; and the bishop of Ross was elated with expectations. Their justice, however, was not the sole, or even the chief, cause of this attention and complaisance. A combination of the English nobles had taken place against Cecil, whose power and credit were objects of indignation and jealousy; and the duke of Norfolk had been active and successful in promoting the scheme of his marriage with the queen of Scots. Taking advantage of the condition of parties, he had practised with the principal nobility to encourage his pretensions to Mary; and he secretly communicated to them the promises of support

fupport he had received from the earl of Murray. By the advice and influence of Sir Nicholas Throgmorton, he engaged in his behalf the earl of Leicefter; and this nobleman imparted the matter to the earls of Pembroke and Arundel. The duke himfelf was able to conciliate the favour of the earls of Derby, Bedford, Shrewfbury, Southampton, Northampton, Northumberland, Weftmorland, and Suffex. In the mean time, he was eagerly preffing Mary herfelf with his fuit and importunities; and had mutually exchanged the tokens of a conftant and fincere love. It was in this forward ftate of the match, that the bifhop of Rofs drew up the fchedule of articles for the accommodation of the rival queens.

744 Eng- nobles ofe ar- s to y.

At the defire of Elizabeth, her privy-council conferred with the bifhop upon thefe articles at different times; and they expreffed themfelves to be highly pleafed with their general import and meaning. Little doubt was entertained of their fuccefs; and the earl of Leicefter, in order to complete the bufinefs, and to ferve the duke of Norfolk, undertook to give them a more fpecial force, and to improve them by the introduction of a ftipulation about the marriage of the queen of Scots. According to his fcheme of agreement, it was required of Mary, that fhe fhould be a party to no attempt againft the rights and titles of the queen of England, or her heirs; that fhe fhould confent to a perpetual league, offenfive and defenfive, between the two kingdoms; that fhe fhould finally eftablifh the Proteftant religion in Scotland; that fhe fhould admit to her favour thofe of her fubjects who had appeared againft her; that if fhe had made any affignment of her kingdom to the duke of Anjou, in the expectation of a marriage to be contracted between them, it fhould be diffolved; and that inftead of looking to a foreign prince, whofe alliance would be dangerous, not only to the religion but to the liberty of the two realms, fhe would agree to marry the duke of Norfolk, the firft peer of England. Thefe articles being communicated to the bifhop of Rofs, he was defired to tranfmit them to Mary; but, as they touched upon fome points concerning which he had no inftructions, he declined this office, and recommended the propriety of their employing a fpecial meffenger of their own in a commiffion of fuch high importance. They accordingly appointed Mr Candifh to go with them to the queen of Scots, and, in a formal defpatch, they extolled the merits of the duke of Norfolk; affured her of the general favour and fupport of the Englifh nobility, if fhe fhould approve of his love: and intimated their belief that Elizabeth would not be averfe from a marriage which gave the certain promife of tranquillity and happinefs to the two kingdoms. This defpatch was in the handwriting of Leicefter; and it was fubfcribed by this nobleman, and the earls of Arundel and Pembroke, and the lord Lumley.

745 ary a- ees to the eaty pro- fed to r.

Mary, in the folitude of her prifon, received this application with pleafure. By the lord Boyd fhe returned a very favourable anfwer to it; but took the liberty to admonifh them of the neceffity of their fecuring the good-will of Elizabeth, left her diflike of the treaty of the marriage fhould excite new difafters and misfortunes, and involve the duke of Norfolk in inconveniency and danger. This advice, the fuggeftion of her delicacy and prudence, did not draw fufficiently their attention. The duke of Norfolk was now impatient to conclude this great tranfaction, in which he had engaged himfelf; and admitted into his councils many nobles whom he had hitherto neglected to court, and many gentlemen who were confiderable from their diftinction and fortunes. The countenance and confent of the kings of France and Spain were thought neceffary to the meafures in agitation, and were folicited and obtained. In the univerfality of the applaufe with which they were honoured, it was fuppofed that Elizabeth would be allured into a cordial acknowledgment of their propriety, or be compelled to afford them a reluctant approbation; and fo ardent a belief prevailed of their fortunate termination, that the marriage-contract was actually intrufted to the keeping of M. Feuelon the French ambaffador.

The activity of the duke of Norfolk with the Englifh nobles did not fo much engrofs his attention as to make him forget the regent. He kept up with him a clofe correfpondence in confequence of the concert into which they had entered, and received the moft ample affurances of his fidelity and fervice. The moft fanguine and feducing hopes elated him. The regent, while he ftipulated for terms of favour and fecurity to himfelf and his faction, appeared to be full of the marriage, as a meafure from which the greateft advantages would arife to the two kingdoms, to the two queens, and to the true religion. The match, in the meanwhile, was anxioufly concealed from Elizabeth; but fhe was zealoufly preffed to conclude an accommodation with Mary, on the foundation of the fchedule of agreement prefented by the bifhop of Rofs. After having had many conferences with her privy-council, fhe feemed inclined to treat definitively for the reftoration of the queen of Scots, and actually agreed to open the tranfaction to the regent. The lord Boyd was fent into Scotland upon this bufinefs; and while he carried her letters, he was intrufted with defpatches from Mary, the duke of Norfolk, and Sir Nicholas Throgmorton.

As the regent was returning from his northern expedition, he was faluted at Elgin by the lord Boyd, who immediately laid before him the defpatches and inftructions with which he had been charged. The queen of England, in her letters, made three propofitions in behalf of Mary, and intimated a defire that one of them fhould be accepted. The queen of Scots, fhe faid, might be reftored fully and abfolutely to her royal eftate: fhe might be affociated in the government with her fon, have the title of *queen*, and, till the prince fhould attain the age of 17 years, the adminiftration might continue in the regent; or fhe might be permitted to return to Scotland in a private ftation, and have an honourable appointment to maintain her in a fafe and happy obfcurity. The defpatches from Mary to the regent defired, that judges might immediately be allowed to inquire into the legality of her marriage with Bothwel: and that, if it was found to have been concluded in oppofition to the laws, it fhould be declared void, and that the liberty be granted to her of entering anew into a matrimonial engagement. The duke of Norfolk expreffed to the regent the gratitude he felt for his friendfhip; promifed him the command of the fulleft exertions of his confequence and power; entreated him to proceed expeditioufly in promoting

The pofa Eliz

The quee Ma

Imp niting Nor

nd. promoting the business of the marriage, and referred him to the instructions of Lord Boyd for a satisfactory answer to any doubts which might give him disgust or uneasiness. By the letters of Throgmorton, the regent was advertised that the marriage of the queen of Scots with the duke of Norfolk was a certain and decided point; and he was counselled to concur heartily and expeditiously in this transaction, that his consent might not seem to have been extorted. Maitland of Lethington was recommended to him by this statesman, as the person whom he should choose to represent him in the English court, as he could negotiate best the terms and mode of his security and of that of his party. In fine, Throgmorton entreated him not to be troubled with any precise scruples or objections, for that his overthrow, if he resisted, would be inevitable; and, in the view of his services and cordiality, he assured him, that no man's friendship would be accepted with greater affection, and no man's estimation be higher or more fortunate. The zeal of Throgmorton induced him also, upon this occasion, to address to Maitland a despatch, in which he was infinitely importunate to hasten his expedition to England, in the character to which he recommended him. He complimented him as the fittest person to open the match to the English queen, on the part of the regent and the Scottish nobility; and he represented the success of the scheme to be infallible, as Elizabeth would never be so unwise as to put her own safety, the peace of her kingdom, and the preservation of her people, in competition with the partial devices that might proceed from the vanity and the passions of any person whatsoever. He enumerated the names of the English nobility who had confederated to promote the marriage. He enlarged upon it as an expedient full of wisdom, and as advantageous in the highest degree to religion and the state. He pointed out the lasting and inseparable connexion of England and Scotland, as its happy and undoubted consequence. For, if James VI. should die, the sceptres of the two kingdoms might devolve to an English prince; and if he should attain to manhood, he might marry the daughter of the duke of Norfolk, and unite, in his person, the two crowns.

59 ...ra- ...f the ...on ...stora- ...&c. of ...een.

These weighty despatches employed fully the thoughts of the regent. The calls of justice and humanity were loud in the behalf of Mary; his engagements to Norfolk were precise and definitive; and the commission of Elizabeth afforded him the command of the most important services. But, on the other hand, the restoration of Mary, and her marriage, would put an end for ever to his greatness; and, amidst all the stipulations which could be made for his protection, the enormity of his guilt was still haunting him with suspicions and terror. His ambition and his selfish sensibilities were an overmatch for his virtue. He practised with his partisans to throw obstacles in the way of the treaty and the marriage; and, on the pretence of deliberating concerning the restoration of Mary, and on her divorce from Bothwel, a convention of the estates was summoned by him to assemble at Perth. To this assembly the letters of Elizabeth were recited; and her propositions were considered in their order. The full restoration of Mary to her dignity was accounted injurious to the authority of the king, and her association with her son in the government was judged improper and dangerous; but it was thought that her deliverance from prison, and her reduction to a private station, were reasonable expedients. No definitive decree, however was pronounced. The letters of Mary were then communicated to this council, and gave rise to vehement debates. She had written and subscribed them in her character of queen of Scotland. This carriage was termed *insolent* and *imperious* by the friends of the regent. They also held it unsafe to examine her requests, till they should be communicated to Elizabeth; and they insinuated, that some inclement and partial device was concealed under the purpose of her divorce from the earl of Bothwel. The favourers of Mary endeavoured to apologize for the form of the letters, by throwing the blame upon her secretaries; and engaged, that while the commissaries, or judges, were proceeding in the business of the divorce, new despatches in the proper method should be applied for and procured. They were heard with evident symptoms of displeasure; and exclaimed, "that it was wonderful to them, that those very persons who lately had been so violent for the separation of the queen and Bothwel should now be so averse from it." The partisans of the regent replied, "that if the queen was so eagerly solicitous to procure the divorce, she might apply to the king of Denmark to execute Bothwel as the murderer of her husband; and that then she might marry the person who was most agreeable to her." The passions of the two factions were inflamed to a most indecent extremity, and the convention broke up with strong and unequivocal marks of hostility and anger.

Notwithstanding the caution with which Mary and Norfolk carried on their intrigues, intimations of them had come to Elizabeth. Norfolk himself, by the advice of the earl of Pembroke, had ventured to disclose his secret to Sir William Cecil, who affected to be friendly to him. The regent, in answer to her letters, transmitted to her the proceedings of the convention at Perth. The application of Mary for a divorce was a key to the ambitious hopes of the duke of Norfolk. She commanded Sir William Cecil to apply himself to discover the conspiracy. This statesman betrayed the confidence with which he had been intrusted; and Elizabeth, while the duke was attending her at Farnham, discovering a mixture of pleasantry and passion, admonished him to be careful on what pillow he reposed his head. The earl of Leicester, alarmed by his fears, revealed to her at Titchfield the whole proceedings of the duke of Norfolk and his friends. Her fury was ungovernable; and at different times she loaded Norfolk with the severest reproaches and contumely, for presuming to think of a marriage with the queen of Scots without the sanction of her concurrence. Insulted with her discourse and her looks, abandoned by Leicester, and avoided by other nobles in whom he had confided, he felt his courage to forsake him. He left the court at Southampton without taking his leave, and went to London to the earl of Pembroke. New intimations of her displeasure were announced to him, and he retired to his seat at Kinninghall in Norfolk. His friends pressed him to take the field, and to commit his safety to the sword; but having no inclination to involve his country in the miseries of war, he rejected their advice; and addressing an apology to E-

 lizabeth

Scotland. lizabeth, protested that he never meant to depart from the fidelity which he owed to her; and that it was his fixed resolution to have applied for her consent to his marriage with the queen of Scots. In return, she ordered him to repair to her court at Windsor; and, as he appeared to be irresolute, a messenger was despatched to take him into custody. He was first confined to the house of Paul Wentworth, at Burnham, in the neighbourhood of Windsor, and then committed to the Tower. The earls of Pembroke and Arundel, the lord Lumley, Sir Nicholas Throgmorton, and the bishop of Ross, were also apprehended and confined.

751 Elizabeth, amidst the ferment of her inquietudes, forgot not to gratify her revenge by insulting the queen of Scots. The name of Mary was sufficient to convulse her with anger. The earl of Huntingdon, who affected to have pretensions to the crown of England that were preferable to those of the Scottish princess, was joined with the earl of Shrewsbury in the office of guarding her. His instructions were rigorous, and he was disposed to exceed them. The earl of Shrewsbury considered it as an indignity to have an associate who was a declared enemy to his charge, who had an interest in her death, and who was remarkable for a natural ferocity of disposition. Mary exclaimed against the indelicacy and rudeness of Elizabeth, and protested that all her intentions were commendable and innocent. Huntingdon took a delight in her sufferings. He ransacked her coffers with a view of making discoveries; but her prudence had induced her to destroy all the evidences of her transactions with the duke of Norfolk; and the officious assiduity of this jailor was only rewarded with two cyphers which he could not comprehend. The domestics whom she favoured were suspected and dismissed. Her train of attendants was diminished. An unrelenting watch was kept upon her. No couriers were allowed to carry her despatches. No messengers were admitted to her presence; and all the letters from her friends were ordered to be intercepted, and to be conveyed to the queen of England.

752 The proceedings of the convention at Perth were afflicting to Elizabeth, to Mary, and to the duke of Norfolk. In the former they created suspicions of the regent; and they were a certain annunciation to the latter, that he was resolved to support himself in the government of Scotland. Uncertain rumours had reached Elizabeth of the interviews he had held with Norfolk in the business of the marriage. Her surprise and indignation were infinite. Mr Wood who brought from the regent his answer to her letter, was treated with disrespect. Secretary Cecil despatched instructions to the Lord Hunsdon, the governor of Berwick, to watch his operations with a jealous eye. Elizabeth, by a special envoy, required from him an explanation of his ambiguous carriage. The regent, true to his interests, apologized to her for his connexions with the duke of Norfolk, by laying open the design of that nobleman to cut him off, in his way to Scotland, by a full communication of whatever had passed between them in relation to Mary, and by offers of an unlimited submission and obedience.

753 While the duke of Norfolk was carrying on his intrigues with Mary, the scheme of an insurrection for her deliverance was advancing under the direction of the earls of Northumberland and Westmorland. Motives of religion were the chief foundation of this conspiracy; and the more zealous Catholics over England were concerned in it. Mary, however, by the advice of the duke of Norfolk, who was afraid of her matching with a foreign prince, did not enter into it with cordiality. It advanced notwithstanding; and the agents of the pope were lavish of exhortations and donatives. The duke of Alva, by the order of his master the king of Spain, encouraged the conspirators with the offer of 20,000 men from the Netherlands; and, under the pretence of adjusting commercial disputes, he sent into England Chiapini Vitelli marquis of Celona, an officer of ability, that he might be at hand, and prepared to take the command of them.—The report of an insurrection was universal. Elizabeth kept an army of 15,000 men near her person. The queen of Scots was removed to Coventry, a place of great strength; and if a superior and commanding force should appear before it, her ferocious keeper, it is said, had orders to assassinate her. Repeated commands were sent to the earls of Northumberland and Westmorland, to repair to court. But the imprisonment of the duke of Norfolk and his friends had struck a panic into them. They conceived that their conspiracy was discovered; and putting themselves at the head of their followers, they issued their manifesto. The restoration of Popery, the establishment of the titles of Mary to the English crown, and the reformation of abuses in the commonwealth, were the avowed objects of their enterprise. But they had embarked in a business for which they were altogether unequal. Their efforts were feeble and desultory. The duke of Alva forgot his promises. Wherever the peace was disturbed by insurgents, there were troops to oppose them. The vigilance of Elizabeth disconcerted with ease the operations of men whom no resources or popularity could have conducted to greatness, and who could neither conquer nor die. The earl of Westmorland, after concealing himself for some time in Scotland, effected an escape into Flanders, where he passed a miserable and useless existence; and the earl of Northumberland being taken by the regent, was imprisoned in the castle of Lochleven.

75[4] As the fury of Elizabeth abated, her resentment to the duke of Norfolk lost its power; and she failed not to distinguish between the intrigues of an honourable ambition, and the practices of an obstinate superstition. It was the result of the examination of this nobleman, and of the confessions of the other prisoners, that Lethington had schemed the business of the marriage, and that the earl of Murray had encouraged it; that her consent was understood to be necessary to its completion; and that Mary herself had warmly recommended the expedient of consulting her pleasure. Upon receiving proper admonitions, the earls of Pembroke, Arundel, the Lord Lumley, Sir Nicholas Throgmorton, and the bishop of Ross, were released from confinement; and, after a more tedious imprisonment, the duke of Norfolk himself was admitted to his liberty. This favour, however, was not extended to him till he had not only submissively acknowledged his presumption in the business of the marriage; but had fully revealed whatever had passed between Mary and him, and solemnly engaged himself never more to think of this alliance,

liance, and never more to take any concern whatsoever in her affairs.

The regent, in the meanwhile, was very anxious to recover the good opinion of Elizabeth. Her treatment of Mr Wood, and her discovery of his practices, had excited his apprehensions. He therefore assembled at Stirling a convention of the estates; and taking her letters a second time into consideration, returned her a reply to them by Robert Pitcairn abbot of Dunfermline, in a style suited to her temper and jealousies, and from which she could decisively infer, that no favour of any kind would be shown to the queen of Scots. But this base condescension, though assisted by his treachery to the duke of Norfolk, not being sufficient, in his opinion, to draw to him completely the cordiality of the queen of England, he was preparing to gratify her with another sacrifice. The partiality of Maitland to Mary, and his intrigues with Norfolk and the English malecontents, had rendered him uncommonly obnoxious to Elizabeth and her ministry. The late commotions had been chiefly ascribed to his arts; and it was natural to dread new calamities and tumults from the fruitful spring of his invention. Under the pretence of employing his service in despatches to England, the regent invited him to Stirling. He was then with the earl of Athol at Perth; and suspecting some improper device, he obeyed the summons with reluctance. When he took his place in the privy-council, Captain Crawford, the minion of the earl of Lenox, who had distinguished himself in the trial of Mary, accused him, in direct terms, of being a party in the murder of the late king. The regent affected astonishment, but permitted him to be taken into custody. He was soon after sent to Edinburgh under a guard, and admonished to prepare for his trial. Upon similar charges, the lord Seton and Sir James Balfour were seized upon and imprisoned.

1756 [...]is pro[...]ed by [...]kaldy [...]range.

Kirkaldy of Grange, the governor of the castle of Edinburgh, who was warmly attached to Maitland, after having remonstrated in vain with the regent on the violence of his conduct, employed address and stratagem in the service of his friend. Under the cover of night, he went with a guard of soldiers to the lodgeing where Maitland was confined; and showing a forged warrant for taking his person into his keeping, got possession of him. Kirkaldy had now in his castle the duke of Chatelherault, the lord Herries, and Maitland. The regent sent for him to a conference; but he refused to obey his message. He put himself and his fortress under the direction of his prisoners. The regent, condescending to pay him a visit, was more lavish than usual of his promises and kindness. His arts, however, only excited the disdain of this generous soldier. Since he could not lead out Maitland to the block, he instituted a process of treason against him, in order to forfeit his estates. Kirkaldy, by the mouth of a trumpeter, desired him to commence similar actions against the earl of Morton and Mr Archibald Douglas, as it was notorious that they were parties to the king's murder. This messenger was likewise charged with delivering a challenge from him to Mr Archibald Douglas, and another from the lord Herries to the earl of Morton. This disappointment, and these indignities, made a deep impression upon the regent; and, in a thoughtful dissatisfied humour, about this time, he made a short progress towards the English border, courting popularity, and deserving it, by an attention to order and justice.

Elizabeth, flattered by his submissive advances, and pleased with his ambition, was now disposed to gratify his fullest wishes; and she perceived, that by delivering to him the queen of Scots, she would effectually relieve herself of a prisoner whose vigour and intrigues were a constant interruption to her repose. A treaty for this purpose was entered into and concluded. The regent was to march an army to the English frontiers, and to receive from her his sovereign into her own dominions, the victim of his power, and the sport of his passions. No hostages and no security were stipulated for her entertainment and good usage. His authority over her was to be without any limits. Upon his part, he was to deliver to Elizabeth the young prince, to put her in possession of the principal forts of Scotland, and to assist her with troops in the event of a war with France. This treaty, so fatal to Mary, and so ruinous to the independence of Scotland, escaped not the vigilance of the bishop of Ross. He complained of it in the strongest terms to Elizabeth; and declared it to be equivalent to a sentence of death against his mistress. The ambassadors of France and Spain were also strenuous in their remonstrances to her upon this subject. All resistance, however, was unavailing; and the execution of the treaty seemed inevitable. Yet how vain are the loftiest schemes of human pride! The career of the regent was hastening to its termination; and the hand of an assassin put a period to his dream of royalty. Scotland did not lose its liberties; but Mary continued to be unfortunate.

Dea[...] the[...]

James Hamilton of Bothwellhaugh, who had been taken a prisoner at the battle of Langside, obtained his liberty and life; but his estates were forfeited.— His wife, the heiress of Woodhouslee, retired upon this emergency to her paternal inheritance, in the hope that it might escape the rapacity of the regent. He had, however, given it away in a gift to one of his favourites, Sir James Ballenden; and the instruments of his power having the inhumanity to strip her of her garments, and to turn her naked out of her house, in a cold and dark night, she became distracted before the morning. Hamilton vowed revenge; and the regent made a mockery of his threats. This contempt inspirited his passions; and the humiliation of the house of Hamilton, to which he was nearly allied, fostered the eagerness of his discontents. The madness of party fermented in him with the atrociousness of rage. His mind reconciled itself to assassination. After watching for some time a proper opportunity to commit his horrible purpose, he found it at Linlithgow. The regent was to pass through this town in his way from Stirling to Edinburgh. Intimations reached him that Hamilton was now to perpetrate his design: and he unaccountably neglected them. The assassin, in a house that belonged to the archbishop of St Andrew's, waited deliberately his approach; and firing his musket from a window, shot him through the body. The wound, when examined, was not judged to be mortal; but the regent finding its pain to increase, prepared himself for death; and in a few hours after he expired. A fleet horse of the abbot of Arbroath's carried the assassin to the palace of Hamilton; and from

otland.

from thence he soon after effected his escape into France.

The death of the earl of Murray made no favourable alteration in the affairs of Mary. Confusion and disorder prevailed throughout the kingdom; and though the friends of the queen were promised assistance from France, nothing effectual was done for them. At last the regency was conferred upon the earl of Lenox; an enemy to his queen, and who treated her friends with the utmost rigour. At the same time Elizabeth continued to amuse with negotiations her unhappy rival. She granted liberty to the bishop of Ross to repair to the queen of Scots, who had been removed to Chatsworth, and to confer with her on the subject of the intended accord and treaty. Mary, conforming to the advances of Elizabeth, authorized the Lord Levingston to pass to her dominions, and to desire her friends to appoint a deputation of their number to give their assistance in promoting the salutary purpose of establishing the tranquillity of their country: and after meeting with some interruptions upon the English borders from the earl of Suffex, this nobleman executed successfully his commission. The queen's lords gave powers to ten nobles to act in a body, or by two of their number, in the intended negotiation: and a safe-conduct from Elizabeth allowed them to enter the English realm, and to remain in it during the space of six months.

While the lord Levingston was consulting the interests of Mary with her friends in Scotland, the bishop of Ross was making earnest suit with Elizabeth to proceed in the projected negotiation. His solicitations were not ineffectual; and Sir William Cecil and Sir Walter Mildmay received the instructions of their mistress to wait upon the queen of Scots at Chatsworth. The heads of accommodation which they proposed were explicit and particular; and the rigour they discovered towards the Scottish princess seemed to vouch their sincerity. It was proposed, that a perfect amity should take place between the two queens; that all the treaties which had formerly been concluded by the two nations should receive an ample confirmation; that the queen of Scots should ratify the treaty of Edinburgh, and forbear from advancing any title or claim to the crown of England during the life of Elizabeth, or to the prejudice of the heirs of her body; that in case of foreign invasions, the two realms should mutually assist each other; that all foreign soldiers should be ordered to depart out of Scotland; that in the future, strangers of the profession of arms should be prohibited from repairing to it, and from taking up their residence in any of its castles or houses of strength; that Mary should hold no correspondence, directly or indirectly, with any subject of England, without the permission of the English queen; that the earl of Northumberland, and the English rebels in Scotland, should be delivered up to Elizabeth; that redress should be given to the subjects of England for the spoils committed upon them by the Scottish borderers; that the murderers of the lord Darnley and the earl of Murray should be duly and effectually punished; that before the queen of Scots should be set at liberty, the young prince her son should be brought into England, and that he should continue in the keeping of Elizabeth till the death of his mother, or till her resignation to him of her crown on attaining his majority; that the queen of Scots should not enter into a negotiation for her marriage without the knowledge of the queen of England, nor conclude it without her approbation, or that of the greatest part of the Scottish nobility; that none of the subjects of Scotland should be suffered to go to Ireland without the safe-conduct of Elizabeth; and that Mary should deliver to her sister all the testimonies and writings which had been sent from France, renouncing and disavowing the pretended marriage between her and the duke of Anjou. Besides these articles of agreement, it was proposed by another treaty to adjust the differences of the queen of Scots and her subjects; and Sir William Cecil and Sir Walter Mildmay embraced the present opportunity of conferring with her upon this business, under the pretence of facilitating its management in the future stages of its progress.

Ma

nego

During their stay at Chatsworth, these statesmen were completely satisfied with the behaviour of the queen of Scots. The candour, sincerity, and moderation, which she displayed, were full assurances to them that upon her part there was no occasion to apprehend any improper policy or art; and the calamities of her condition were a still securer pledge of her compliance. Elizabeth, upon hearing their report, affected to be highly pleased with her sister, and sent a message to the earl of Lenox, instructing him in the conditions which had been submitted to Mary; and desiring him to despatch commissioners into England to deliberate in the treaty, and to consult his interest and that of his faction. Nor did Mary neglect to transmit to her friends in Scotland the proposed terms of agreement; and the bishop of Ross, who had assisted her in the conferences with Sir William Cecil and Sir Walter Mildmay, conveyed intimations of them to the pope, the king of France, and the duke of Alva; besought their advice, and informed these princes, that unless an effectual relief could be expected from their favour, the necessities of her condition would compel her to subscribe to the hard and humiliating dictates of the queen of England.

The

Eliz

But while Mary and her friends were indulging the hope of a termination to her troubles, Elizabeth was secretly giving comfort to her adversaries, and encouraging them to throw obstacles in the way of the treaty. Sir William Cecil wrote to the regent, expressing his disapprobation of the negotiations at Chatsworth; desiring him not to be apprehensive of the boastings of the adherents of the queen of Scots; and advising him to make choice of commissioners, in the name of the king, in whose constancy and fortitude he could rely, and whom no address could allure from his interest, or from the common cause in which he and his friends were embarked. The earl of Suffex also sent him despatches, in which he admonished him to turn his anxious attention to the approaching negotiation, and to insist on secure stipulations for the preservation of the prince, for his own safety, and for a general indemnity to the nobles and their adherents, whose party he had espoused. In every event, he represented it as proper for him to pay the greatest respect to Elizabeth; and, if no treaty should be concluded, he advised him to be prepared for reducing the friends of Mary to obedience, and for defending himself against invasions from abroad. By these artifices, the regent and his faction

3

ſaction were inclined to intimate to Elizabeth their warm diſſatisfaction with the terms of agreement which ſhe had propoſed to Mary; and Pitcairn abbot of Dunfermline, who had been appointed ſecretary of ſtate in the room of Maitland of Lethington, was deputed to her upon this buſineſs. He exclaimed againſt the treaty as wild and impolitic; and contended, that no ſtipulations could bind Mary, whoſe religion taught her to keep no faith with heretics; that her claims to the Engliſh crown, and her reſentment againſt the queen of England, as well as her own ſubjects, would immediately upon her reſtoration, involve the two kingdoms in blood; and that no peace or quiet could be expected or enjoyed, but by adhering to the ſalutary maxim of detaining her in a ſure and cloſe captivity. Elizabeth did not diſcourage theſe inclement ſentiments; and Pitcairn was aſſured by her, that from her natural love to the king, and her regard to the nobles who upheld his authority, ſhe would faithfully provide for their ſecurity; and that if juſtice ſhould appear deciſively upon their ſide, ſhe would even ſtrenuouſly maintain their quarrel and their conſequence.

Mary had been carried to Sheffield, and was recovering from a feveriſh indiſpoſition. To this place the biſhop of Galloway and the lord Levingſton, who had been ſelected by her friends to be her acting deputies in England, repaired in order to impart to her the ſtate of affairs in Scotland, and to receive her commands. After repeated conferences on the ſubject of the approaching treaty, ſhe gave them her commiſſion and inſtructions, and joining them to the biſhop of Roſs, ſent them to Elizabeth. They claimed an audience of this princeſs, and were admitted to it at Hamptoncourt. Having preſented their credentials, they informed her, that they were ready to conclude a treaty of concord and agreement, upon principles the moſt extenſive and liberal; and, repreſenting to her the impoveriſhed and tumultuous ſtate of their country, they begged her to proceed in the buſineſs with expedition. The orders, they ſaid, which they had received, and their own inclinations, diſpoſed them to follow her advice and counſel in all points which were honourable and conſiſtent with reaſon; and as her protection was the only refuge of the adverſaries of their queen, they took the liberty to obſerve, that it was completely in her power to put a period to all diſturbances and animoſity, and to accompliſh an accord, which would not only confer upon her the higheſt reputation, but be uſ the moſt ſignal utility to the two kingdoms. Elizabeth declared, that it would pleaſe and flatter her in no common degree to advance in the negotiation; and that it was a pain to her that the regent, by his delay in ſending commiſſioners, ſhould diſcover any averſion from it. This anſwer was deemed very favourable by the biſhop of Roſs and his aſſociates; and they obtained her authority to deſpatch a meſſenger to the regent to haſten his operations.

In the mean time, Mary received deſpatches from the pope, the king of France, and the duke of Alva: and they concurred in recommending it to her to accept of the articles of accommodation which were offered by Elizabeth. The Turk was giving employment to the pope and the king of Spain; Charles IX. already enfeebled by the obſtinate valour of the Huguenots, was buſy in deceiving them with appearances of peace, and in plotting their overthrow; and the duke of Alva felt himſelf inſecure in his government of the Netherlands. But while they ſtrongly adviſed Mary to conclude an agreement with the queen of England, they were yet laviſh to her of their expreſſions of a conſtant amity; and if the treaty ſhould miſcarry, they promiſed to make the moſt ſtrenuous exertions in her behalf, and to aſſiſt her adherents with money, ammunition, and troops.

The earl of Morton, the abbot of Dunfermline, and Mr James Macgill, had been appointed by the regent and his faction to be their commiſſioners in the name of the king; and at length their arrival was announced to Elizabeth. Conforming to the ſpirit of their party, the earl of Morton and his colleagues took an early opportunity to juſtify to her the depoſition of the queen of Scots, and by this means to interrupt the progreſs of the treaty. In an elaborate memorial, they affected to conſider Mary as unworthy to reign, and aſſerted the conſtitutional power of the people to curb her ambition, and to throw her down from royalty. They endeavoured to intrench themſelves within the authority of laws, civil, canon, and municipal; and they recited opinions to her prejudice by many pious divines. But though the general poſition, that the people have a title to reſiſt the dominion of the ſovereign is clear and indubitable; yet their application of it to the queen of Scots was wildly precarious and improper. To ſpeak of her tyranny, and her violation of the rights of her people, was even a wanton mockery of truth and juſtice; for inſtead of having aſſumed an illegal exorbitancy of power, ſhe had ſuffered in her own perſon and rights, and had been treated by her ſubjects with the moſt cruel and tyrannical inſolence. Elizabeth, who was unwilling and afraid to enter anew into the conduct of Mary, who was fully ſenſible of the inſolence of her adverſaries, and who did not approve of any maxims that preſſed againſt the majeſty of princes, received their memorial with ſurpriſe and indignation. She perceived not, ſhe told them, any reaſon that could vindicate the ſeverity which had been ſhown to the queen of Scots by her enemies; and adviſed them to conſider, that in the preſent negotiation it was their proper buſineſs to conſult the ſecurity of the king and of their faction.

Upon the part of Elizabeth, the commiſſioners were the lord keeper Bacon, the earls of Suſſex and Leiceſter, the lord Clynton, the lord chamberlain, Sir William Cecil, who about this time was created Lord Burleigh, Sir Francis Knollys, Sir James Croft, Sir Walter Mildmay, and Sir Thomas Smith. The deputies of Mary were invited to meet with the Engliſh commiſſioners in the houſe of the lord keeper; and after he had ſtated the general purpoſes of the treaty, he intimated to them, that there were two points which required a particular diſcuſſion. A proper ſecurity, he ſaid, ought to be given by the queen of Scots for her due performance of the ſtipulations of the agreement with Elizabeth; and it was expedient to concert the mode of the pardon and indemnity which ſhe was to extend to the ſubjects of Scotland who had offended her. As an aſſurance of the accommodation with his miſtreſs, he demanded, that the duke of Chatelherault, the earls of Huntley and Argyll, the lords Hume and Herries, with another perſon of high rank, ſhould be ſurrendered to

land.

her, and remain in England for three years; that the castles of Dumbarton and Hume should be in her possession during the same period; and as to the article concerning the delivery of the prince into her custody, he observed, that it would be required from the regent, the queen of Scots not having the power of its performance. The deputies of Mary, surprised with this language, entreated the English delegates to reflect, that their queen, if deprived of the most faithful of her nobles, and of her strongest forts, could have little desire or ambition to return to her own kingdom; for she would thus be unable to protect herself against the turbulence of her subjects, and be a sovereign without friends, and without strength. They were inclined, they said, to put their commission and powers to the fullest stretch, in order to gratify Elizabeth; and they would agree, that two earls and two barons should be surrendered for two years, as hostages of the fidelity of their sovereign; under the restriction, that they might be exchanged every six months for persons of an equal condition, if they should be desirous of returning to their own country. As to the giving up of any forts or castles, they would not agree to it, because among the other inconveniencies of this measure, similar claims would be competent to the king of France, by the spirit of the treaty of Edinburgh, which stipulated, that no French or English troops should be admitted into Scotland. The lord keeper Bacon, resuming his discourse, told them, that the whole realm of Scotland, its prince, nobles, and castles, were an inadequate pledge to the queen of England; and that, if his advice would be followed, the queen of Scots should not obtain her liberty upon any kind of security which could be granted by the Scottish nation. In all public treaties, said the delegates of Mary, no further assurance can be required from a sovereign than what consists with his safety; and when exactions are pressed from a contracting party in a league which are ruinous and impossible, it is understood that a foundation is sought to break off the negotiation. The English commissioners, now interfering in a body, declared upon their honour, that it was the meaning of Elizabeth to agree to the restoration of the queen of Scots to her crown and realm upon receiving sufficient assurances for the articles of the accommodation; that the security offered for her acceptance, should be submitted to her deliberation; and that they would immediately proceed to confer with the deputies for the king of Scots.

7
vith
ng's
es.

The English commissioners were not unacquainted with the sentiments of the earl of Morton and his colleagues; and it was from this quarter that they expected a resolute and definitive interruption to the treaty. Nor did these delegates disappoint the expectations conceived of them. After affecting to take a comprehensive view of the articles under debate, they declared, that their commission gave them authority to treat about the amity of the two kingdoms, and the maintenance of the true religion; but that it conferred upon them no power to receive their queen into Scotland, or to surrender to Elizabeth the person of their king. They therefore begged not to be urged to accede to a league which, in some future period, might expose them to a charge of high treason.

8
ech
els
eaty.

This singular declaration was considered to be solid and weighty by the English commissioners; and, in a new conference, it was communicated by them to the deputies of Mary. The bishop of Ross and his associates were disgusted with this formal impertinence. They did not hesitate to pronounce the plea of an insufficient commission from the king to his delegates to be an unworthy and most frivolous subterfuge. The authors, they said, of the deposition of their sovereign did not need any authority but their own to set her at liberty; the prince was not yet five years of age, and could give them no instructions: and the regent was wholly dependent upon the will and pleasure of the queen of England. It was represented in return by the English delegates, that the commission of King James to his deputies, having been perused by Elizabeth, was accounted by her to be insufficient; and that it was her opinion, that the earl of Morton should return to Scotland to hold a parliament for obtaining new powers. The bishop of Ross exclaimed, that the queen of Scots had been amused with deceitful promises, that the prudence of Elizabeth had been corrupted by partial counsels, and that the allegations and pretences held out for interrupting the negotiation were affected and unreal. The instructions, he said, from his sovereign to her commissioners, were to negotiate and to conclude, and not to trifle; and they would not by any means consent to protract, by artificial delays, a treaty which the queen of England, if her intentions were sincere and right, could immediately terminate upon reasonable and honourable terms. His speech and his demeanour he acknowledged to be free and open; and he besought them to excuse him, since, having been made an instrument to abuse his mistress with false hopes, he could not but resent the indignity, and express what he knew and what he felt. The English deputies, addressing him and his colleagues, observed, that as the friends of Mary, and those of the king her son, could not come to an agreement, and as their queen was refused the assurance she expected, they held their commission to be at an end, and were no longer at liberty to negotiate.

two qu

The insincerity of Elizabeth, and the failure of the league or agreement, filled Mary with resentment and complaints. Her animosities, and those of Elizabeth, were increased and fortified. She was in haste to communicate to her allies the unworthy treatment she had received; and she sent her commands to her adherents in Scotland to rise up in arms, to repose no trust in truces which were prejudicial and treacherous, and to employ all their resources and strength in the humiliation of the regent and his faction. Elizabeth, who by this time apprehended no enterprise or danger from Charles IX. or the duke of Alva, resolved, on the other hand, to gave a strong and effectual support to the king's friends, and to disunite by stratagem, and oppress by power, the partizans of the Scottish princess. The zeal of the bishop of Ross having raised her anger, she commanded him to depart from London; and Mary, in contempt of her mandate, ordered him to remain there under the privilege of her ambassador. The high and unbroken spirit of the Scottish queen, in the midst of her misfortunes, never once awakened the generous admiration of Elizabeth. While it uniformly inflamed her rage, it seems also to have excited her terror. With a pusillanimous meanness, she sent a despatch to the earl of Shrewsbury, instructing him to keep his charge in the closest

ledge of Paul's style and manner, that he would peruse his other epistles with much greater ease.

177 That the epistle to the Romans was written at Corinth by St Paul, is ascertained by the testimony of the ancient Christians. It was composed in the year 58, in the 24th year after Paul's conversion, and is the seventh epistle which he wrote. From the Acts of the Apostles we learn that it must have been written within the space of three months; for that was the whole period of Paul's residence in Greece, (Acts xx. 1, 2, 3.)

178 The following analysis of this epistle we have taken from a valuable little treatise, entitled, A Key to the New Testament, which was written by Dr Percy bishop of Dromore. It exhibits the intention of the apostle, and the arguments which he uses to prove his different propositions, in the most concise, distinct, and connected manner, and affords the best view of this epistle that we have ever seen.

179 "The Christian church at Rome appears not to have been planted by an apostle; wherefore St Paul, lest it should be corrupted by the Jews, who then swarmed in Rome, and of whom many were converted to Christianity, sends them an abstract of the principal truths of the gospel, and endeavours to guard them against those erroneous notions which the Jews had of justification, and of the election of their own nation.

"Now the Jews assigned three grounds for justification. First, 'The extraordinary piety and merits of their ancestors, and the covenant made by God with these holy men.' They thought God could not hate the children of such meritorious parents: and as he had made a covenant with the patriarchs to bless their posterity, he was obliged thereby to pardon their sins. Secondly, 'A perfect knowledge and diligent study of the law of Moses.' They made this a plea for the remission of all their sins and vices. Thirdly, 'The works of the Levitical law,' which were to expiate sin, especially circumcision and sacrifices. Hence they inferred that the Gentiles must receive the whole law of Moses, in order to be justified and saved.

"The doctrine of the Jews concerning election was, 'That as God had promised to Abraham to bless his seed, to give him not only spiritual blessings, but also the land of Canaan, to suffer him to dwell there in prosperity, and to consider him as his church upon earth:' That therefore this blessing extended to their whole nation, and that God was bound to fulfil these promises to them, whether they were righteous or wicked, faithful or unbelieving. They even believed that a prophet ought not to pronounce against their nation the prophecies with which he was inspired; but was rather to beg of God to expunge his name out of the book of the living.

"These previous remarks will serve as a key to unlock this difficult epistle, of which we shall now give a short analysis. See *Michaelis's Lectures on the New Testament.*

180 "I. The Epistle begins with the usual salutation with which the Greeks began their letters, (chap. i. 1—7.)

"II. St Paul professes his joy at the flourishing state of the church at Rome, and his desire to come and preach the gospel, (ver. 8—19.): then he insensibly introduces the capital point he intended to prove, viz.

"III. The subject of the gospel (ver. 16, 17.), that it reveals a righteousness unknown before, which is derived solely from faith, and to which Jews and Gentiles have an equal claim.

"IV. In order to prove this, he shows (chap. i. 18.—iii. 20.) that both Jews and Gentiles are 'under sin,' i. e. that God will impute their sins to Jews as well as to Gentiles.

"His arguments may be reduced to these syllogisms (chap. ii. 1. 17—24.) 1. 'The wrath of God is revealed against those who hold the truth in unrighteousness; i. e. who acknowledge the truth, and yet sin against it. 2. The Gentiles acknowledged truths; but, partly by their idolatry, and partly by their other detestable vices, they sinned against the truth they acknowledged. 3. Therefore the wrath of God is revealed against the Gentiles, and punisheth them. 4. The Jews have acknowledged more truths than the Gentiles, and yet they sin. 5. Consequently the Jewish sinners are yet more exposed to the wrath of God (ch. ii. 1—12.) Having thus proved his point, he answers certain objections to it. *Obj.* 1. 'The Jews were well grounded in their knowledge, and studied the law.' He answers, 'If the knowledge of the law, without observing it, could justify them, then God could not have condemned the Gentiles, who knew the law by nature, (chap. ii. 13—16.) *Obj.* 2. 'The Jews were circumcised.' *Ans.* That is, ye are admitted by an outward sign into the covenant with God. This sign will not avail you when ye violate that covenant (chap. ii. 25. to the end). *Obj.* 3. 'According to this doctrine of St Paul, the Jews have no advantage before others.' *Ans.* Yes, they still have advantages; for unto them are committed the oracles of God. But their privileges do not extend to this, that God should overlook their sins, which, on the contrary, Scripture condemns even in the Jews (chap. iii. 1—19.) *Obj.* 4. 'They had the Levitical law and sacrifices.' *Ans.* From hence is no remission, but only the knowledge of sin, (chap. iii. 20.)

"V. From all this St Paul concludes, that Jews and Gentiles may be justified by the same means, namely, without the Levitical law, through faith in Christ: And in opposition to the imaginary advantages of the Jews, he states the declaration of Zechariah, that God is the God of the Gentiles as well as of the Jews, (ch. iii. 21. to the end.)

"VI. As the whole blessing was promised to the faithful descendants of Abraham, whom both Scripture and the Jews call his children, he proves his former assertion from the example of Abraham; who was an idolater before his call, but was declared just by God, on account of his faith, long before his circumcision. Hence he takes occasion to explain the nature and fruits of faith, (chap. iv. 1. v. 11.)

"VII. He goes on to prove from God's justice, that the Jews had no advantages over the Gentiles with respect to justification. Both Jews and Gentiles had forfeited life and immortality, by the means of one common father of their race, whom they themselves had not chosen. Now as God was willing to restore immortality by a new spiritual head of a covenant, viz. Christ, it was just that both Jews and Gentiles should share in this new representative of the whole race (ch. v. 12. to the end).—Chap. v. ver. 15, 16. amounts to this negative question, "Is it not fitting that the free gift should extend as far as the offence?"

"VIII. He

Scripture.

"VIII. He shows that the doctrine of justification, as stated by him, lays us under the strongest obligations of holiness, (ch. vi. 1. to the end.)

"IX. He shows that the law of Moses no longer concerns us at all; for our justification arises from our appearing in God's sight, as if actually dead with Christ on account of our sins; but the law of Moses was not given to the dead. On this occasion he proves at large, that the eternal power of God over us is not affected by this; and that whilst we are under the law of Moses we perpetually become subject to death, even by sins of inadvertency, (ch. vii. 1. to the end.)

"X. Hence he concludes, that all those, and those only, who are united with Christ, and for the sake of his union do not live according to the flesh, are free from all condemnation of the law, and have an undoubted share in eternal life, (ch. viii. 1—17.)

"XI. Having described their blessedness, he is aware that the Jews, who expected a temporal happiness, should object to him, that Christians notwithstanding endure much suffering in this world. He answers this objection at large, (ch. viii. 18. to the end.)

"XII. He shows that God is not the less true and faithful, because he doth not justify, but rather rejects and punishes, those Jews who would not believe the Messiah, (ch. ix. x. xi.) In discussing this point, we may observe the cautious manner in which, on account of the Jewish prejudices, he introduces it (ch. ix. 1—5.), as well as in the discussion itself.

"He shows that the promises of God were never made to all the posterity of Abraham, and that God always reserved to himself the power of choosing those sons of Abraham whom, for Abraham's sake, he intended to bless, and of punishing the wicked sons of Abraham; and that with respect to temporal happiness or misery, he was not even determined in his choice by their works. Thus he rejected Ishmael, Esau, the Israelites in the desert in the time of Moses, and the greater part of that people in the time of Isaiah, making them a sacrifice to his justice, (ch. ix. 6—29.)

"He then proceeds to show that God had reason to reject most of the Jews then living, because they would not believe in the Messiah, though the gospel had been preached to them plainly enough, (chap. ix. 30. x. to the end.) However, that God had not rejected all his people, but was still fulfilling his promise upon many thousand natural descendants of Abraham, who believed in the Messiah, and would in a future period fulfil them once more; for that all Israel would be converted, (ch. xi. 1—32.) And he concludes with admiring the wise counsels of God, (ver. 33. to the end.)

"XIII. From the doctrine hitherto laid down, and particularly from this, that God has in mercy accepted the Gentiles; he argues, that the Romans should consecrate and offer themselves up wholly to God. This leads him to mention in particular some Christian duties, (ch. xii.), viz.

"XIV. He exhorts them to be subject to magistrates (ch. xiii. 1—7.); the Jews at that time being given to sedition.

"XV. To love one another heartily (ver. 2—10.) And,

"XVI. To abstain from those vices which were considered as things indifferent among the Gentiles, (ver. 11. to the end.)

"XVII. He exhorts the Jews and Gentiles in the Christian church to brotherly unity, (ch. xiv. 2. xv. 13.)

"XVIII. He concludes his Epistle with an excuse for having ventured to admonish the Romans, whom he had not converted; with an account of his journey to Jerusalem; and with some salutations to those persons whom he meant to recommend to the church at Rome." See *Michaelis's Lectures on the New Testament*.

First epistle to the Corinthians.

Corinth was a wealthy and luxurious city, built upon the isthmus which joins the Morea to the northern parts of Greece. In this city Paul had spent two years founding a Christian church, which consisted of a mixture of Jews and Gentiles, but the greater part Gentiles.

Its date.

About three years after the apostle had left Corinth, he wrote this Epistle from Ephesus in the year 56 or 57, and in the beginning of Nero's reign. That it was written from Ephesus, appears from the salutation with which the Epistle closes, (chap. xvi. 19.) "The churches of Asia salute you. Aquila and Priscilla salute you much in the Lord." From these words it is evident, in the first place, that the Epistle was written in Asia. 2dly, It appears from Acts xviii. 18, 19. that Aquila and Priscilla accompanied Paul from Corinth to Ephesus, where they seem to have continued till Paul's departure.

St Paul had certainly kept up a constant intercourse with the churches which he had founded; for he was evidently acquainted with all their revolutions. They seem to have applied to him for advice in those difficult cases which their own understanding could not solve; and he was ready on all occasions to correct their mistakes.

General design.

This Epistle consists of two parts. 1. A reproof for those vices to which they were most propense; 2. An answer to some queries which they had proposed to him.

The Corinthians, like the other Greeks, had been accustomed to see their philosophers divide themselves into different sects; and as they brought along with them into the Christian church their former opinions and customs, they wished, as before, to arrange themselves under different leaders. In this Epistle Paul condemns these divisions as inconsistent with the spirit of Christianity, which inculcates benevolence and unanimity, and as opposite to the conduct of Christian teachers, who did not, like the philosophers, aspire after the praise of eloquence and wisdom. They laid no claim to these nor to any honour that cometh from men. The apostle declares, that the Christian truths were revealed from heaven; that they were taught with great plainness and simplicity, and proved by the evidence of miracles, (chap. i. 1.) He dissuades them from their divisions and animosities, by reminding them of the great trial which every man's work must undergo; of the guilt they incurred by polluting the temple or church of God; of the vanity of human wisdom; and of glorying in men. He admonishes them to esteem the teachers of the gospel only as the servants of Christ; and to remember that every superior advantage which they enjoyed was to be ascribed to the goodness of God, (chap. iii. 4.)

2. In the fifth chapter the apostle considers the case of a notorious offender, who had married his stepmother;

ther; and tells them, that he ought to be excommunicated. He also exhorts the Christians not to associate with any person who led such an openly profane life.

3. He censures the Corinthians for their litigious disposition, which caused them to prosecute their Christian brethren before the Heathen courts. He expresses much warmth and surprise that they did not refer their differences to their brethren; and concludes his exhortations on this subject by assuring them that they ought rather to allow themselves to be defrauded than to seek redress from Heathens (chap. v. 1—9.)

4. He inveighs against those vices to which the Corinthians had been addicted before their conversion, and especially against fornication, the criminality of which they did not fully perceive, as this vice was generally overlooked in the system of the philosophers, (chap. vi. 10. to the end.)

185 ...n. certain questions which had ...osed to

Having thus pointed out the public irregularities with which they were chargeable, he next replies to certain questions which the Corinthians had proposed to him by letter. He, 1. Determines some questions relating to the marriage state; as, 1st, Whether it was good to marry under the existing circumstances of the church? And, 2d, Whether they should withdraw from their partners if they continued unbelievers? (ch. vii.)

2. He instructs them how to act with respect to idol offerings. It could not be unlawful in itself to eat the food which had been offered to idols; for the consecration of flesh or wine to an idol did not make it the property of the idol, an idol being nothing, and therefore incapable of property. But some Corinthians thought it lawful to go to a feast in the idol temples, which at the same time were places of resort for lewdness, and to eat the sacrifices whilst praises were sung to the idol. This was publicly joining in the idolatry. He even advises to abstain from such participation as was lawful, rather than give offence to a weak brother; which he enforces by his own example, who had abstained from many lawful things, rather than prove a scandal to the gospel, (chap. vii. ix. x.)

3. He answers a third query concerning the manner in which women should deliver any thing in public, when called to it by a divine impulse. And here he censures the unusual dress of both sexes in prophesying, which exposed them to the contempt of the Greeks, among whom the men usually went uncovered and the women veiled.

Being thus led to the consideration of the abuses that prevailed in their public worship, he goes on to censure the irregularities which were committed at their love feasts, or, as we term them, the *Lord's Supper*. It was a common practice with the Greeks at their social suppers for every man to bring his own provisions along with him, not, however, to share them with the company, but to feast upon them in a solitary manner. Thus the rich ate and drank to excess, while the poor were totally neglected. The Corinthians introduced the same practice in the celebration of the Lord's Supper, thus confounding it with their ordinary meals, and without ever examining into the end of the institution. It was this gross abuse that Paul reproves in the 11th chapter. He also censures their conduct in the exercise of the extraordinary gifts of the Holy Ghost; he shows them they all proceeded from the same spirit, and were intended for the instruction of Christian societies; that all Christians ought to be united in mutual love; and that tenderness ought to be shown to the most inconsiderable member, as every one is subservient to the good of the whole (chap. xii.) In the 13th chapter he gives a beautiful description of benevolence, which has been much and justly admired. He represents it as superior to the supernatural gifts of the spirit, to the most exalted genius, to universal knowledge, and even to faith. In the 14th chapter he cautions the Corinthians against ostentation in the exercise of the gift of languages, and gives them proper advices.

4. He asserts the resurrection of the dead, in opposition to some of the Corinthians who denied it, founding it upon the resurrection of Jesus Christ, which he considers as one of the most essential doctrines of Christianity. He then answers some objections to the resurrection, drawn from our not being capable of understanding how it will be accomplished, (chap. xv.) He then concludes with some directions to the Corinthian church concerning the manner of collecting alms; promises them a visit, and salutes some of the members. 186

The second Epistle to the Corinthians was written from Macedonia in the year 57, about a year after the former. See 2 Cor. ix. 1—5. viii. and xiii. 1.

The second Epistle to the Corinthians.

187

St Paul's first Epistle had wrought different effects among the Corinthians: many of them examined their conduct; they excommunicated the incestuous man; requested St Paul's return with tears; and vindicated him and his office against the false teacher and his adherents. Others of them still adhered to that adversary of St Paul, expressly denied his apostolic office, and even furnished themselves with pretended arguments from that Epistle. He had formerly promised to take a journey from Ephesus to Corinth, thence to visit the Macedonians, and return from them to Corinth (2 Cor. i. 15, 16.) But the unhappy state of the Corinthian church made him alter his intention (verse 23.), since he found he must have treated them with severity. Hence his adversaries partly argued, 1. That St Paul was irresolute and unsteady, and therefore could not be a prophet: 2. The improbability of his ever coming to Corinth again, since he was afraid of them. Such was the state of the Corinthian church when St Paul, after his departure from Ephesus, having visited Macedonia, (Acts xx. 1.) received an account of the above particulars from Titus (2 Cor. vii. 5, 6.), and therefore wrote them his second Epistle about the end of the same year, or the beginning of 58.

State of the Corinthian church.

188

But to give a more distinct view of the contents of this Epistle:

View of the contents of this Epistle.

1. The apostle, after a general salutation, expresses his grateful sense of the divine goodness; professing his confidence in God, supported by a sense of his own integrity; makes an apology for not having visited the Corinthians as he had intended, and vindicates himself from the charge of fickleness, (chap. i.)

2. He forgives the incestuous man, whose conduct had made so deep an impression on the apostle's mind, that one reason why he had deferred his journey to Corinth was, that he might not meet them in grief, nor till he had received advice of the effect of his apostolical admonitions. He mentions his anxiety to meet Titus at Troas, in order to hear of their welfare; expresses

Scripture.

his thankfulness to God for the success attending his ministry, and speaks of the Corinthians as his credentials, written by the finger of God, (chap. ii. iii. 1—6.)

3. He treats of the office committed to him of preaching the redemption; and highly prefers it to preaching the law: to which probably his adversaries had made great pretences. They had ridiculed his sufferings; which he shows to be no disgrace to the gospel or its ministers; and here he gives a short abstract of the doctrine he preaches, (chap. iii. 6. v. to the end.)

He expatiates with great copiousness on the temper with which, in the midst of afflictions and persecutions, he and his brethren executed their important embassy; and with great affection and tenderness he exhorts them to avoid the pollution of idolatry, (chap. vi.) He endeavours to win their confidence, by telling them how much he rejoiced in their amendment and welfare, and how sorry he had been for the distress which his necessary reproofs had occasioned, (chap. vii.) He then exhorts them to make liberal contributions for the Christians in Judæa. He recommends to them the example of the Macedonians, and reminds them of the benevolence of the Lord Jesus. He expresses his joy for the readiness of Titus to assist in making the collection; and makes also honourable mention of other Christian brethren, whom he had joined with Titus in the same commission, (chap. viii.) He then, with admirable address, urges a liberal contribution, and recommends them to the divine blessing, (chap. ix.)

4. Next he obviates some reflections which had been thrown upon him for the mildness of his conduct, as if it had proceeded from fear. He asserts his apostolical power and authority, cautioning his opponents against urging him to give too sensible demonstrations of it, (chap. x.) He vindicates himself against the insinuations of some of the Corinthians, particularly for having declined pecuniary support from the church; an action which had been ungenerously turned to his disadvantage. To show his superiority over those designing men who had opposed his preaching, he enumerates his sufferings; gives a detail of some extraordinary revelations which he had received; and vindicates himself from the charge of boasting, by declaring that he had been forced to it by the desire of supporting his apostolical character, (chap. xi. xii.) He closes the Epistle, by assuring them with great tenderness how much it would grieve him to demonstrate his divine commission by severer methods.

189 Epistle to the Galatians.

The Galatians were descended from those Gauls who had formerly invaded Greece, and afterwards settled in Lower Asia. St Paul had preached the gospel among them in the year 51, soon after the council held at Jerusalem, (Acts xvi. 6.) Asia swarmed at that time with zealots for the law of Moses, who wanted to impose it upon the Gentiles, (Acts xv. 1.) Soon after St Paul had left the Galatians, these false teachers had got among them, and wanted them to be circumcised, &c. This occasioned the following Epistle, which Michaelis thinks was written in the same year, before St Paul left Thessalonica. Dr Lardner dates it about the end of the

190 The date

year 52, or in the very beginning of 53, before St Paul set out to go to Jerusalem by way of Ephesus.

The subject of this Epistle is much the same with that of the Epistle to the Romans; only this question is more fully considered here, "Whether circumcision, and an observance of the Levitical law, be necessary to the salvation of a Christian convert?" It appears, these Judaizing Christians, whose indirect views St Paul exposes (Acts xv. 1. Gal. x. 3. 9.), at first only represented circumcision as necessary to salvation; but afterwards they insisted upon the Christians receiving the Jewish festivals, (Gal. iv. 10.)

As St Paul had founded the churches of Galatia, and instructed them in the Christian religion, he does not set before them its principal doctrines as he had done in the Epistle to the Romans; but referring them to what he had already taught (chap. i. 8, 9.), he proceeds at once to the subject of the Epistle.

As it appears from several passages of this Epistle, particularly chap. i. 7, 8, 10. and chap. v. 11. that the Judaizing Christians had endeavoured to persuade the Galatians that Paul himself had changed his opinion, and now preached up the Levitical law; he denies that charge, and affirms that the doctrines which he had tought were true, for he had received them from God by immediate revelation. He relates his miraculous conversion; asserts his apostolical authority, which had been acknowledged by the disciples of Jesus; and, as a proof that he had never inculcated a compliance with the Mosaic law, he declares that he had opposed Peter at Antioch for yielding to the prejudices of the Jews.

Having now vindicated his character from the suspicion of fickleness, and shown that his commission was divine, he argues that the Galatians ought not to submit to the law of Moses: 1. Because they had received the Holy Ghost and the gifts of miracles, not by the law, but by the gospel, (chap. iii. 1—5.) 2. Because the promises which God made to Abraham were not restricted to his circumcised descendants, but extended to all who are his children by faith, (chap. iii. 6—18.) In answer to the objection, *To what then serveth the law?* he replies, That it was given because of transgression; that is to preserve them from idolatry till the Messiah himself should come. 3. Because all men, whether Jews or Gentiles, are made the children of God by faith, or by receiving the Christian religion, and therefore do not stand in need of circumcision, (ch. iii. 26—29.) From the 1st verse of chapter iv. to the 11th, he argues that the law was temporary, being only fitted for a state of infancy; but that the world, having attained a state of manhood under the Messiah, the law was of no further use. In the remaining part of chap. iv. he reminds them of their former affection to him, and assures them that he was still their sincere friend. He exhorts them to stand fast in the liberty with which Christ had made them free; for the sons of Agar, that is, those under the law given at Mount Sinai, are in bondage, and to be cast out; the inheritance being designed for those only who are the free-born sons of God under the spiritual covenant of the gospel.

The apostle next confutes the false report which had been spread abroad among the Galatians, that Paul himself preached up circumcision. He had already indirectly refuted this calumny by the particular account which he gives of his life; but he now directly and openly contradicts it in the following manner:

1. By

Scripture.

1. By assuring them, that all who thought circumcision necessary to salvation could receive no benefit from the Christian religion, (chap. v. 2—4.)

2. By declaring, that he expected justification only by faith, (ver. 5, 6.)

3. By testifying, that they had once received the truth, and had never been taught such false doctrines by him, (ver. 7, 8.)

4. By insinuating that they should pass some censure on those who misled them (ver. 9, 10.), by declaring that he was persecuted for opposing the circumcision of the Christians, (ver. 11.)

5. By expressing a wish that those persons should be cut off who troubled them with his doctrine.

This Epistle affords a fine instance of Paul's skill in managing an argument. The chief objection which the advocates for the Mosaic law had urged against him was, that he himself preached circumcision. In the beginning of the Epistle he overturns this slander by a statement of facts, without taking any express notice of it; but at the end fully refutes it, that it might leave a strong and lasting impression upon their minds.

He next cautions them against an idea which his arguments for Christian liberty might excite, that it consisted in licentiousness. He shows them it does not consist in gratifying vicious desires; for none are under stronger obligations to moral duties than the Christian. He recommends gentleness and meekness to the weak (chap. vi. 1—5.), and exhorts them to be liberal to their teachers, and unto all men (ver. 6—10.) He concludes with exposing the false pretences of the Judaizing teachers, and asserting the integrity of his own conduct.

194 Epistle to the Ephesians.

Ephesus was the chief city of all Asia on this side Mount Taurus. St Paul had passed through it in the year 54, but without making any stay, (Acts xviii. 19—21.) The following year he returned to Ephesus again, and staid there three years, (chap. xix.) During his abode there he completed a very flourishing church of Christians, the first foundations of which had been laid by some inferior teachers. As Ephesus was frequented by persons of distinction from all parts of Asia Minor, St Paul took the opportunity of preaching in the ancient countries (ver. 10.); and the other churches of Asia were considered as the daughters of the church of Ephesus; so that an Epistle to the Ephesians was, in effect, an epistle to the other churches of Asia at the same time.

195 The date

Dr Lardner shows it to be highly probable that this Epistle was written in the year 61, soon after Paul's arrival at Rome.

196 and design of it.

As Paul was in a peculiar manner the apostle of the Gentiles, and was now a prisoner at Rome in consequence of having provoked the Jews, by asserting that an observance of the Mosaic law was not necessary to obtain the favour of God, he was afraid lest an advantage should be taken of his confinement to unsettle the minds of those whom he had converted. Hearing that the Ephesians stood firm in the faith of Christ, without submitting to the law of Moses, he writes this Epistle to give them more exalted views of the love of God, and of the excellence and dignity of Christ. This Epistle is not composed in an argumentative or didactic style: The first three chapters consist almost entirely of thanksgivings and prayers, or glowing descriptions of the blessings of the Christian religion. This circumstance renders them a little obscure; but by the assistance of the two following epistles, which were written on the same occasion, and with the same design, the meaning of the apostle may be easily discovered. The last three chapters contain practical exhortations. He first inculcates unity, love, and concord, from the consideration that all Christians are members of the same body, of which Christ is the head. He then advises them to forsake the vices to which they had been addicted while they remained heathens. He recommends justice and charity; strenuously condemns lewdness, obscenity, and intemperance, vices which seem to have been too common among the Ephesians. In the 6th chapter he points out the duties which arise from the relations of husbands and wives, parents and children, masters and servants; and concludes with strong exhortations to fortitude, which he describes in an allegorical manner.

197 Epistle to the Philippians.

The church at Philippi had been founded by Paul, Silas, and Timothy (Acts xvi.), in the year 51, and had continued to show a strong and manly attachment to the Christian religion, and a tender affection for the apostle. Hearing of his imprisonment at Rome, they sent Epaphroditus, one of their pastors, to supply him with money. It appears from this Epistle that he was in great want of necessaries before this contribution arrived; for as he had not converted the Romans, he did not consider himself as entitled to receive supplies from them. Being a prisoner, he could not work as formerly; and it was a maxim of his never to accept any pecuniary assistance from those churches where a faction had been raised against him. From the Philippians he was not averse to receive a present in the time of want, because he considered it as a mark of their affection, and because he was assured that they had conducted themselves as sincere Christians.

198 The date

It appears from the apostle's own words, that this letter was written while he was a prisoner at Rome, (chap. i. 7, 13. iv. 22.); and from the expectation which he discovers (chap. ii. 24.) of being soon released and restored to them, compared with Philemon v. 22. and Heb. xiii. 13. where he expresses a like expectation in stronger terms, it is probable that this was written towards the end of his first imprisonment in the year 62.

199 and design of it.

The apostle's design in this Epistle, which is quite of the practical kind, seems to be, "to comfort the Philippians under the concern they had expressed at the news of his imprisonment; to check a party spirit that appears to have broke out among them, and to promote, on the contrary, an entire union and harmony of affection; to guard them against being seduced from the purity of the Christian faith by Judaizing teachers; to support them under the trials with which they struggled; and, above all, to inspire them with a concern to adorn their profession by the most eminent attainments in the divine life." After some particular admonitions in the beginning of the 4th chapter, he proceeds in the 8th verse to recommend virtue in the most extensive sense, mentioning all the different foundations in which it had been placed by the Grecian philosophers. Towards the close of the Epistle, he makes his acknowledgments to the Philippians for the seasonable and libe-

Scripture.

ral supply which they had sent him, as it was so convincing a proof of their affection for him, and their concern for the support of the gospel, which he preferred far above any private secular interest of his own; expressly disclaiming all selfish, mercenary views, and assuring them with a noble simplicity, that he was able upon all occasions to accommodate his temper to his circumstances; and had learned, under the teachings of Divine grace, in whatever station Providence might see fit to place him, therewith to be content. After which, the apostle, having encouraged them to expect a rich supply of all their wants from their God and Father, to whom he devoutly ascribes the honour of all, concludes with salutations from himself and his friends at Rome to the whole church, and a solemn benediction, (verse 10. to the end); and declares, that he rejoiced in their liberality chiefly on their own account.

200 Epistle to the Colossians—Date and design of it.

The Epistle to the Colossians was written while Paul was in prison (chap. iv. 3.), and was therefore probably composed in the year 62. The intention of the apostle, as far as can be gathered from the epistle itself, was to secure the Colossians from the influence of some doctrines that were subversive of Christianity, and to excite them to a temper and behaviour worthy of their sacred character. A new sect had arisen, which had blended the oriental philosophy with the superstitious opinions of the Jews.

201 To guard the Colossians against the dangerous doctrines of the Jews.

They held 1. That God was surrounded by demons or angels, who were mediators with God, and therefore to be worshipped. 2. That the soul is defiled by the body; that all bodily enjoyments hurt the soul, which they believed to be immortal, though they seem to have denied the resurrection of the body, as it would only render the soul sinful by being reunited to it. 3. That there was a great mystery in numbers, particularly in the number seven; they therefore attributed a natural holiness to the seventh or Sabbath day, which they observed more strictly than the other Jews. They spent their time mostly in contemplation; abstained from marriage, and every gratification of the senses; used washings, and thought it sinful to touch certain things; regarded wine as poison, &c.

Percy's Key to the New Testament.

202 The arguments which the apostle employs.

The arguments against these doctrines are managed with great skill and address. He begins with expressing great joy for the favourable character which he had heard of them, and assures them that he daily prayed for their farther improvement. Then he makes a short digression, in order to describe the dignity of Jesus Christ; declares that he had created all things, whether thrones or dominions, principalities and powers; that he alone was the head of the church, and had reconciled men to the Father. The inference from this description is evident, that Jesus was superior to angels; that they were created beings, and ought not to be worshipped. Thus he indirectly confutes one doctrine before he formally opposes it. Paul now returns from his digression in the 21st verse to the sentiments with which he had introduced it in the 13th and 14th verses, and again expresses his joy that the Philippians remained attached to the gospel, which was to be preached to the Gentiles, without the restraints of the ceremonial law. Here again he states a general doctrine, which was inconsistent with the opinions of those who were zealous for the law of Moses; but he leaves the Colossians to draw the inference, (chap. i.)

Having again assured them of his tender concern for their welfare, for their advancement in virtue, and that they might acknowledge the mystery of God, that is, that the gospel was to supersede the law of Moses, he proceeds directly to caution them against the philosophy of the new teachers, and their superstitious adherence to the law; shows the superiority of Christ to the angels, and warns Christians against worshipping them. He censures the observation of Sabbaths, and rebukes those who required abstinence from certain kinds of food, and cautions them against persons who assume a great appearance of wisdom and virtue (chap. ii.)

20[3] Exhortations.

In the 3d chapter he exhorts them, that, instead of being occupied about external ceremonies, they ought to cultivate pure morality. He particularly guards them against impurity, to which they had before their conversion been much addicted. He admonishes them against indulging the irascible passions, and against committing falsehood. He exhorts them to cultivate the benevolent affections, and humility, and patience. He recommends also the relative duties between husbands and wives, parents and children, masters and servants. He enjoins the duties of prayer and thanksgiving (chap. iv. 2.), and requests them to remember him in their petitions. He enjoins affability and mild behaviour to the unconverted Heathens (verse 6.); and concludes the epistle with matters which are all of a private nature, except the directions for reading this epistle in the church of Laodicea, as well as in the church of Colosse.

2[04] First [epistle] to th[e Thes]salon[ians].

This epistles is addressed to the inhabitants of Thessalonica, the capital of Macedonia, a large and populous city. It appears from the Acts, chapter xvii. 1. that the Christian religion was introduced into this city by Paul and Silas, soon after they had left Philippi. At first they made many converts; but at length the Jews, ever jealous of the admission of the Gentiles to the same privileges with themselves, stirred up the rabble, which assaulted the house where the apostle and his friends lodged; so that Paul and Silas were obliged to flee to Berea, where their success was soon interrupted by the same restless and implacable enemies. The apostle then withdrew to Athens; and Timothy, at his desire, returned to Thessalonica (1 Thess. iii. 2.) to see what were the sentiments and behaviour of the inhabitants after the persecution of the Jews. From Athens Paul went to Corinth, where he stayed a year and six months; during which, Timothy returned with the joyful tidings that the Thessalonians remained steadfast to the faith, and firmly attached to the apostle, notwithstanding his flight. Upon this he sent them this epistle, A. D. 52, in the 12th year of Claudius.

The

This is generally reckoned the first epistle which Paul wrote; and we find he was anxious that it should be read to all the Christians. In chap. v. 27. he uses these words; "I adjure you by the Lord, that this epistle be read unto all the holy brethren." This direction is very properly inserted in his first epistle.

and of

The intention of Paul in writing this epistle was evidently to encourage the Thessalonians to adhere to the Christian religion. This church being still in its infancy, and oppressed by the powerful Jews, required to be established in the faith. St Paul, therefore, in the three first chapters, endeavours to convince the Thessalonians of the truth and divinity of his gospel, both by the

Scripture. the miraculous gifts of the Holy Ghost which had been imparted, and by his own conduct when among them.

While he appeals, in the first chapter, to the miraculous gifts of the Holy Spirit, he is very liberal in his commendations. He vindicates himself from the charge of timidity, probably to prevent the Thessalonians from forming an unfavourable opinion of his fortitude, which his flight might have excited. He asserts, that he was not influenced by selfish or dishonourable motives, but that he was anxious to please God and not man. He expresses a strong affection for them, and how anxious he was to impart the blessings of the gospel. He congratulates himself upon his success; mentions it to their honour that they received the gospel as the word of God and not of man, and therefore did not renounce it when persecution was raised by the Jews. He expresses a strong desire to visit the Thessalonians; and assures them be had been hitherto retained against his will.

As a farther proof of his regard, the apostle informs them, that when he came to Athens, he was so much concerned, lest, being discouraged by his sufferings, they should be tempted to cast off their profession, that he could not forbear sending Timothy to comfort and strengthen them; and expresses, in very strong terms, the sensible pleasure he felt, in the midst of all his afflictions, from the favourable account he received of their faith and love: to which he adds, that he was continually praying for their farther establishment in religion, and for an opportunity of making them another visit, in order to promote their edification, which lay so near his heart, (chap. iii. throughout.)

Having now shown his paternal affection for them, with great address he improves all that influence which his zeal and fidelity in their service must naturally have given him to inculcate upon them the precepts of the gospel. He recommends chastity, in opposition to the prevailing practice of the heathens; justice, in opposition to fraud. He praises their benevolence, and encourages them to cultivate higher degrees of it. He recommends industry and prudent behaviour to their heathen neighbours. In order to comfort them under the loss of their friends, he assures them that those who were fallen asleep in Jesus should be raised again at the last day, and should, together with those who remained alive, be caught up to meet their Lord, and share his triumph, (chap. iv.) He admonishes them to prepare for this solemn event, that it might not come upon them unawares; and then concludes the Epistle with various exhortations.

207 Second Epistle to the Thessalonians.

The second Epistle to the Thessalonians appears to have been written soon after the first, and from the same place; for Silvanus or Silas, and Timothy, are joined together with the apostle in the inscriptions of this Epistle, as well as of the former.

208 Contents of it.

The apostle begins with commending the faith and charity of the Thessalonians, of which he had heard a favourable report. He expresses great joy on account of the patience with which they supported persecution; and observes that their persecution was a proof of a righteous judgment to come, where their persecutors would meet with their proper recompense, and the righteous be delivered out of all their afflictions. He assures them of his constant prayers for their farther improvement, in order to attain the felicity that was promised, (chap. i.)

From misunderstanding a passage in his former letter, it appears that the Thessalonians believed the day of judgment was at hand. To rectify this mistake, he informs them that the day of the Lord will not come till a great apostasy has overspread the Christian world, the nature of which he describes (c). Symptoms of this mystery of iniquity had then appeared; but the apostle expresses his thankfulness to God that the Thessalonians had escaped this corruption. He exhorts them to steadfastness, and prays that God would comfort and strengthen them, (chap. ii.)

He requests the prayers of the Thessalonians for him and his two assistants, at the same time expressing his confidence that they would pay due regard to the instructions which he had given them. He then proceeds to correct some irregularities. Many of the Thessalonians seem to have led an idle disorderly life; these he severely reproves, and commands the faithful to shun their company if they still remained incorrigible.

209 First Epistle to Timothy, when written.

When the first Epistle to Timothy was written, it is difficult to ascertain. Lardner dates it in 56; Mill, Whitby, and Macknight, place it in 64; but the arguments on which each party founds their opinion are too long to insert here.

210 Intention and contents of it.

Timothy was the intimate friend and companion of Paul, and is always mentioned by that apostle with much affection and esteem. Having appointed him to superintend the church of Ephesus during a journey which he made to Macedonia, he wrote this letter, in order to direct him how to discharge the important trust which was committed to him. This was the more necessary, as Timothy was young and unexperienced, (1 Tim. iv. 12.) In the beginning of the Epistle he reminds him of the charge with which he had intrusted him, to wit, to preserve the purity of the gospel against the pernicious doctrines of the Judaizing teachers, whose opinions led to frivolous controversies, and not to a good life. He shows the use of the law of Moses, of which these teachers were ignorant. This account of the law, he assures Timothy, was agreeable to the representation of it in the gospel, with the preaching of which he was intrusted. He then makes a digression, in the fulness of his heart, to express the sense which he felt of the goodness of God towards him.

In the second chapter the apostle prescribes the manner in which the worship of God was to be performed in the church of Ephesus; and in the third explains the qualifications of the persons whom he was to ordain as bishops and deacons. In the fourth chapter he foretels the great corruptions of the church which were to prevail in future times, and instructs him how to support the sacred character. In the fifth chapter he

(c) For an explanation of this prophecy, Dr Hurd's Sermons may be consulted. He applies it to the papal power, to which it corresponds with astonishing exactness.

Scripture. he teaches Timothy how to admonish the old and young of both sexes; mentions the age and character of such widows as were to be employed by the society in some peculiar office: and subjoins some things concerning the respect due to elders. In the sixth chapter he describes the duties which Timothy was to inculcate on slaves; condemns trifling controversies and pernicious disputes; censures the excessive love of money, and charges the rich to be rich in good works.

211 Second Epistle to Timothy.

That the second Epistle to Timothy was written from Rome is universally agreed; but whether it was during his first or second imprisonment has been much disputed. That Timothy was at Ephesus or in Asia Minor when this Epistle was sent to him, appears from the frequent mention in it of persons residing at Ephesus.

212 Design and contents of it.

The apostle seems to have intended to prepare Timothy for those sufferings which he foresaw he would be exposed to. He exhorts him to constancy and perseverance, and to perform with a good conscience the duties of the sacred function.

The false teachers, who had before thrown this church into confusion, grew every day worse: insomuch that not only Hymenæus, but Philetus, another Ephesian heretic, now denied the resurrection of the dead. They were led into this error by a dispute about words. At first they only annexed various improper significations to the word *resurrection*, but at last they denied it altogether (H); pretending that the resurrection of the dead was only a resurrection from the death of sin, and so was already past. This error was probably derived from the eastern philosophy, which placed the origin of sin in the body, (chapter ii.) He then forewarns him of the fatal apostasy and declension that was beginning to appear in the church; and at the same time animates him, from his own example and the great motives of Christianity, to the most vigorous and resolute discharge of every part of the ministerial office.

213 Epistle to Titus.

This Epistle is addressed to Titus, whom Paul had appointed to preside over the church of Crete. It is difficult to determine either its date or the place from which it was sent. The apostle begins with reminding Titus of the reasons for which he had left him at

214 Design and contents of it.

Crete; and directs him on what principles he was to act in ordaining Christian pastors: the qualifications of whom he particularly describes. To show him how cautious he ought to be in selecting men for the sacred office, he reminds him of the art of the Judaizing teachers, and the bad character of the Cretans, (chapter i.)

He advises him to accommodate his exhortations to the respective ages, sexes, and circumstances, of those whom it was his duty to instruct; and to give the greater weight to his instructions, he admonishes him to be an example of what he taught, (chap. ii.) He exhorts him also to teach obedience to the civil magistrate, because the Judaizing Christians affirmed that no obedience was due from the worshippers of the true God to magistrates who were idolaters. He cautions against censoriousness and contention, and recommends meekness; for even the best Christians had formerly been wicked, and all the blessings which they enjoyed they derived from the goodness of God. He then enjoins Titus strenuously to inculcate good works, and to avoid useless controversies; and concludes with directing him how to proceed with those heretics who attempted to sow dissension in the church.

Epistle to Philemon —Its design.

The Epistle to Philemon was written from Rome at the same time with the Epistles to the Colossians and Philippians, about A. D. 62 or 63. The occasion of the letter was this: Onesimus, Philemon's slave, had robbed his master and fled to Rome; where, happily for him, he met with the apostle, who was at that time a prisoner at large, and by his instructions and admonitions was converted to Christianity, and reclaimed to a sense of his duty. St Paul seems to have kept him for some considerable time under his eye, that he might be satisfied of the reality of the change; and, when he had made a sufficient trial of him, and found that his behaviour was entirely agreeable to his profession, he would not detain him any longer for his own private convenience, though in a situation that rendered such an assistant peculiarly desirable (compare ver. 13, 14.), but sent him back to his master; and, as a mark of his esteem, entrusted him, together with Tychicus, with the charge of delivering his Epistle to the church at Colosse, and giving them a particular account of the state of things at Rome, recommending him to them, at the same time, as a faithful and beloved brother, (Col. iv. 9.) And as Philemon might well be supposed to be strongly prejudiced against one who had left his service in so infamous a manner, he sends him this letter, in which he employs all his influence to remove his suspicions, and reconcile him to the thoughts of taking Onesimus into his family again. And whereas St Paul might have exerted that authority which his character as an apostle, and the relation in which he stood to Philemon as a spiritual father, would naturally give him, he chooses to entreat him as a friend; and with the softest and most insinuating address urges his suit, conjuring him by all the ties of Christian friendship that he would not deny him his request: and the more effectually to prevail upon him, he represents his own peace and happiness as deeply interested in this event; and speaks of Onesimus in such terms as were best adapted to soften his prejudices, and dispose him to receive one who was so dear to himself, not merely as a servant, but as a fellow Christian and a friend.

Doddr. Fam. Exposit.

The ... and ... which ... apo... cove... this

It is impossible to read over this admirable Epistle, without being touched with the delicacy of sentiment, and the masterly address that appear in every part of it. We see here, in a most striking light, how perfectly consistent true politeness is, not only with all the warmth and sincerity of the friend, but even with the dignity of the Christian and the apostle. And if this letter were to be considered in no other view than as a mere human composition, it must be allowed a masterpiece in its kind. As an illustration of this remark, it may not be improper

(H) This is by no means uncommon amongst men; to begin to dispute about the signification of words, and to be led gradually to deny the thing signified. This appears to have been the cause of most disputes, and the general beginnings of scepticism and infidelity.

ipture.

improper to compare it with an epistle of Pliny, that seems to have been written upon a similar occasion, (Lib. IX. let 21.); which, though penned by one that was reckoned to excel in the epistolary style, and though it has undoubtedly many beauties, yet must be acknowledged, by every impartial reader, vastly inferior to this animated composition of the apostle.

217 istle to e He-ews was upposed Paul.

The Epistle to the Hebrews has been generally ascribed to Paul; but the truth of this opinion has been suspected by others, for three reasons: 1. The name of the writer is nowhere mentioned, neither in the beginning nor in any other part of the Epistle. 2. The style is said to be more elegant than Paul's. 3. There are expressions in the Epistle which have been thought unsuitable to an apostle's character. 1. In answer to the first objection, Clemens Alexandrinus has assigned a very good reason: "Writing to the Hebrews (says he), who had conceived a prejudice against him, and were suspicious of him, he wisely declined setting his name at the beginning, lest he should offend them." 2. Origen and Jerome admired the elegance of the style, and reckoned it superior to that which Paul has exhibited in his Epistles: but as ancient testimony had assigned it to Paul, they endeavoured to answer the objection, by supposing that the sentiments were the apostle's, but the language and composition the work of some other person. If the Epistle, however, be a translation, which we believe it to be, the elegance of the language may belong to the translator. As to the composition and arrangement, it cannot be denied that there are many specimens in the writings of this apostle not inferior in these qualities to the Epistle to the Hebrews. 3. It is objected, that in Heb. ii. 3. the writer of this Epistle joins himself with those who had received the gospel from Christ's apostles. Now Paul had it from Christ himself. But Paul often appeals to the testimony of the apostles in support of those truths which he had received from revelation: We may instance 1 Cor. xv. 5, 6, 7, 8.; 2 Tim. ii. 2.

acknight the Epi-s.

218 Quoted as s by an-ent wri-ers.

This Epistle is not quoted till the end of the second century, and even then does not seem to have been universally received. This silence might be owing to the Hebrews themselves, who supposing this letter had no relation to the Gentiles, might be at no pains to diffuse copies of it. The authors, however, on whose testimony we receive it as authentic, are entitled to credit; for they lived so near the age of the apostles, that they were in no danger of being imposed on; and from the numerous list of books which they rejected as spurious, we are assured that they were very careful to guard against imposition. It is often quoted as Paul's by Clemens Alexandrinus, about the year 194. It is received and quoted as Paul's by Origen, about 230; by Dionysius bishop of Alexandria in 247; and by a numerous list of succeeding writers.

219 Written in he Syro-Chaldaic anguage.

The Epistle to the Hebrews was originally written in Hebrew, or rather Syro-Chaldaic; a fact which we believe on the testimony of Clemens Alexandrinus, Jerome, and Eusebius. To this it has been objected, that as these writers have not referred to any authority, we ought to consider what they say on this subject merely as an opinion. But as they state no reasons for adopting this opinion, but only mention as a fact that Paul wrote to the Hebrews in their native language, we must allow that it is their testimony which they produce, and not their opinion. Eusebius informs us, that some supposed Luke the Evangelist, and others Clemens Romanus, to have been the translator. Scripture.

According to the opinion of ancient writers, particularly Clemens Alexandrinus, Jerome, and Euthalius, this Epistle was addressed to the Jews in Palestine.—The scope of the Epistle confirms this opinion.

220 Date of it.

Having now given sufficient evidence that this Epistle was written by Paul, the time when it was written may be easily determined: For the salutation from the saints of Italy (chap. iv. 24.), together with the apostle's promise to see the Hebrews (ver. 23.), plainly intimate, that his confinement was then either ended or on the eve of being ended. It must therefore have been written soon after the Epistles to the Colossians, Ephesians, and Philemon, and not long before Paul left Italy, that is, in the year 61 or 62.

Percy's Key to the New Testament.

As the zealous defenders of the Mosaic law would naturally insist on the divine authority of Moses, on the majesty and glory attending its promulgation by the ministry of angels, and the great privileges it afforded those who adhered to it; the apostle shows,

I. That in all these several articles Christianity had an infinite superiority to the law.

221 Design of it to prove to the Jews the truth of the Christian religion, and its superiority to the law of Moses;

This topic he pursues from chap. i. to xi. wherein he reminds the believing Hebrews of the extraordinary favour shown them by God, in sending them a revelation by his own Son, whose glory was far superior to that of angels (chap. i. throughout); very naturally inferring from hence the danger of despising Christ on account of his humiliation, which, in perfect consistence with his dominion over the world to come, was voluntarily submitted to by him for wise and important reasons; particularly to deliver us from the fear of death, and to encourage the freedom of our access to God (chap. ii. throughout). With the same view he magnifies Christ as superior to Moses, their great legislator; and from the punishment inflicted on those who rebelled against the authority of Moses, infers the danger of contemning the promises of the gospel (chap. iii. 2—13.) And as it was an easy transition to call to mind on this occasion that rest in Canaan to which the authority invested in Moses was intended to lead them; the apostle hence cautions them against unbelief, as what would prevent their entering into a superior state of rest to what the Jews ever enjoyed (chap. iii. 14. iv. 11.) This caution is still further enforced by awful views of God's omniscience, and a lively representation of the high priesthood of Christ (chap. iv. to the end; and chap. v. throughout). In the next place, he intimates the very hopeless situation of those who apostatize from Christianity (chap. vi. 1—9.); and then, for the comfort and confirmation of sincere believers, displays to them the goodness of God, and his faithful adherence to his holy engagements; the performance of which is sealed by the entrance of Christ into heaven as our forerunner (chap. vi. 9. to the end). Still farther to illustrate the character of our Lord, he enters into a parallel between him and Melchizedec as to their title and descent; and, from instances wherein the priesthood of Melchizedec excelled the Levitical, infers, that the glory of the priesthood of Christ surpassed that under the law (chap. vii. 1—17.) From these premises the apostle argues, that the Aaronical priesthood was not only excelled, but consummated by that of Christ, to

to which it was only introductory and subservient; and of course, that the obligation of the law was henceforth dissolved (chap. vii. 18. to the end). Then recapitulating what he had already demonstrated concerning the superior dignity of Christ's priesthood, he thence illustrates the distinguished excellence of the new covenant, as not only foretold by Jeremiah, but evidently enriched with much better promises than the old (chap. viii. througbout): explaining farther the doctrine of the priesthood and intercession of Christ, by comparing it with what the Jewish high priests did on the great day of atonement (chap. ix. 1—14). Afterwards he enlarges on the necessity of shedding Christ's blood, and the sufficiency of the atonement made by it (chap. ix. 15. to the end); and proves that the legal ceremonies could not by any means purify the conscience; whence he infers the insufficiency of the Mosaic law, and the necessity of looking beyond it, (chap. x. 1—15). He then urges the Hebrews to improve the privileges which such a high priest and covenant conferred on them, to the purposes of approaching God with confidence, to a constant attendance on his worship, and most benevolent regards to each other (chap. x. 15—25.)

The apostle having thus obviated the insinuations and objections of the Jews, for the satisfactinn and establishment of the believing Hebrews, proceeds,

222 And to animate them to bear persecution with fortitude.

II. To prepare and fortify their minds against the storm of persecution which in part had already befallen them, which was likely to continue, and he often renewed, he reminds them of those extremities they had endured, and of the fatal effects which would attend their apostasy (chap. x. 26. to the end); calling to their remembrance the eminent examples of faith and fortitude exhibited by holy men, and recorded in the Old Testament (chap. xi. 1—29.) he concludes his discourse with glancing at many other illustrious worthies; and, besides those recorded in Scripture, refers to the case of several who suffered under the persecution of Antiochus Epiphanes (2 Maccab. chap. viii. &c. chap. xi. 30. xii. 2.)

Having thus finished the argumentative part of the Epistle, the apostle proceeds to the proper application; in which he exhorts the Hebrew Christians to patience, peace and holiness, (chap. xii. 3—14.); cautions them against secular views and sensual gratifications, by laying before them the incomparable excellence of the blessings introduced by the gospel, which even the Jewish economy, glorious and magnificent as it was, did by no means equal; exhorts them to brotherly affection, purity, compassion, dependance on the divine care, stedfastness in the profession of truth, a life of thankfulness to God, and benevolence to man: and concludes the whole with recommending their pious ministers to their particular regard, entreating their prayers, saluting and granting them his usual benediction.

223 The seven Catholic epistles.

The seven following Epistles, one of James, two of Peter, three of John, and one of Jude, have been distinguished by the appellation of *catholic* or *general* epistles, because most of them are inscribed, not to particular churches or persons, but to the body of Jewish or Gentile converts over the world. The authenticity of some of these has been frequently questioned, viz. the Epistle of James, the second of Peter, the Epistle of Jude, and the second and third of John. The ancient Christians were very cautious in admitting any books into their canon whose authenticity they had any reason to suspect. They rejected all the writings forged by heretics in the name of the apostles, and certainly, therefore, would not receive any without first subjecting them to a severe scrutiny. Now, though these five epistles were not immediately acknowledged as the writings of the apostles, this only shows that the persons who doubted had not received complete and incontestable evidence of their authenticity. But as they were afterwards universally received, we have every reason to conclude that upon a strict examination they were found to be the genuine productions of the apostles. The truth is, so good an opportunity had the ancient Christians of examining this matter, so careful were they to guard against imposition, and so well founded was their judgment concerning the books of the New Testament, that as Dr Lardner observes, no writing which they pronounced genuine has been yet proved spurious, nor have we at this day the least reason to believe any book genuine which they rejected.

Mac... on the ...stles.

2.. Epist... James... Less.

That the Epistle of James was written in the apostolical age is proved by the quotations of ancient authors. Clemens Romanus and Ignatius seem to have made references to it. Origin quotes it once or twice.—There are several reasons why it was not more generally quoted by the first Christian writers. Being written to correct the errors and vices which prevailed among the Jews, the Gentiles might think it of less importance to them, and therefore take no pains to procure copies of it. As the author was sometimes denominated James the Just, and often called Bishop of Jerusalem, it might be doubted whether he was one of the apostles. But its authenticity does not seem to have been suspected on account of the doctrines which it contains. In modern times, indeed, Luther called it a strawy epistle (*epistola straminea*), and excluded it from the sacred writings, on account of its apparent opposition to the apostle Paul concerning justification by faith.

This Epistle could not be written by James the Elder, the son of Zebedee, and brother of John, who was beheaded by Herod in the year 44, for it contains passages which refer to a future period. It must, therefore, have been the composition of James the Less, the son of Alpheus, who was called *the Lord's brother*, because he was the son of Mary, the sister of our Lord's mother. As to the date of this Epistle, Lardner fixes it in the year 61 or 62.

2.. The ...

James the Less statedly resided at Jerusalem, whence he hath been styled by some ancient fathers bishop of that city, though without sufficient foundation. Now James being one of the apostles of the circumcision, while he confined his personal labours to the inhabitants of Judea, so it was very natural for him to endeavour by his writings to extend his services to the Jewish Christians who were dispersed abroad in more distant regions. For this purpose, there are two points which the apostle seems to have principally aimed at, though he hath not pursued them in an orderly and logical method, but in the free epistolary manner, handling them jointly or distinctly as occasions naturally offered. And these were, " to correct those errors both in doctrine and practice into which the Jewish Christians had fallen, which might otherwise have produced fatal consequen-

2.. and d... of it.

ces;

Scripture.

ces; and then to eſtabliſh the faith and animate the hope of ſincere believers, both under their preſent and their approaching ſufferings."

The opinions which he is moſt anxious to refute are theſe, that God is the author of ſin, (ch. i. 13.); that the belief of the doctrines of the goſpel was ſufficient to procure the favour of God for them, however deficient they were in good works, (ch. ii.) He diſſuades the Jews from aſpiring to the office of teachers in the third chapter, becauſe their prejudices in favour of the law of Moſes might induce them to pervert the doctrines of the goſpel. He therefore guards them againſt the ſins of the tongue, by repreſenting their pernicious effects; and as they thought themſelves wiſe and intelligent, and were ambitious of becoming teachers, he adviſes them to make good their pretenſions, by ſhowing themſelves poſſeſſed of that wiſdom which is from above, (ch. iii.)

The deſtruction of Jeruſalem was now approaching; the Jews were ſplit into factions, and often ſlaughtered one another; the apoſtle, therefore, in the fourth chapter, admoniſhes them to purify themſelves from thoſe vices which produced tumults and bloodſhed. To rouſe them to repentance, he foretels the miſeries that were coming upon them. Laſtly, He checks an irreligious ſpirit that ſeems to have prevailed, and concludes the Epiſtle with ſeveral exhortations.

227 First Epiſtle of Peter.

The authenticity of the firſt Epiſtle of Peter has never been denied. It is referred to by Clemens Romanus, by Polycarp, and is quoted by Papias, Irenæus, Clemens Alexandrinus, and Tertullian. It is addreſſed to the ſtrangers ſcattered through Pontus, &c. who are evidently Chriſtians in general, as appears from chap. ii. 10. "In time paſt they were not a people, but are now the people of God." From Peter's ſending the ſalutation of the church at Babylon to the Chriſtians in Pontus, &c. it is generally believed that he wrote it in Babylon. There was a Babylon in Egypt and another in Aſſyria. It could not be the former, for it was an obſcure place, which ſeems to have had no church for the four firſt centuries. We have no authority to affirm that Peter ever was in Aſſyria. The moſt probable opinion is that of Grotius, Whitby, Lardner, as well as of Euſebius, Jerome, and others, that by Babylon Peter figuratively means Rome.

228 The date

Lardner dates it in 63 or 64, or at the lateſt 65.

229 and deſign of it.

St Peter's chief deſign is to confirm the doctrine of St Paul, which the falſe teachers pretended he was oppoſing; and to aſſure the proſelytes that they ſtood in the true grace of God, (ch. v. 12.) With this view he calls them elect; and mentions, that they had been declared ſuch by the effuſion of the Holy Ghoſt upon them, (ch. i. 1, 2.) He aſſures them that they were regenerate without circumciſion, merely through the goſpel and reſurrection of Chriſt, (ver. 3, 4, 21—25.); and that their ſufferings were no argument of their being under the diſpleaſure of God, as the Jews imagined, (ver. 6—12.) He recommends it to them to hope for grace to the end, (ver. 13.) He teſtifies, that they were not redeemed by the Paſchal lamb, but through Chriſt, whom God had preordained for this purpoſe before the foundation of the world, (ver. 18—20.)

The ſecond Epiſtle of Peter is not mentioned by any ancient writer extant till the fourth century, from which time it has been received by all Chriſtians except the Syrians. Jerome acquaints us, that its authenticity was diſputed, on account of a remarkable difference between the ſtyle of it and the former Epiſtle. But this remarkable difference in ſtyle is confined to the 2d chapter of the 2d Epiſtle. No objection, however, can be drawn from this circumſtance; for the ſubject of that chapter is different from the reſt of Peter's writings, and nothing is ſo well known as that different ſubjects ſuggeſt different ſtyles. Peter, in deſcribing the character of ſome flagitious impoſtors, feels an indignation which he cannot ſuppreſs: it breaks out, therefore, in the bold and animated figures of an oriental writer. Such a diverſity of ſtyle is not uncommon in the beſt writers, eſpecially when warmed with their ſubject.

Scripture.

230 Second Epiſtle of Peter. The authenticity of it proved

231 from internal evidence.

This objection being removed, we contend that this Epiſtle was written by Peter, from the inſcription, *Simon Peter, a ſervant and an apoſtle of Jeſus Chriſt.* It appears from chap. i. 16, 17, 18, that the writer was one of the diſciples who ſaw the transfiguration of our Saviour. Since it has never been aſcribed to James or John, it muſt therefore have been Peter. It is evident, from chap. iii. 1. that the author had written an Epiſtle before to the ſame perſons, which is another circumſtance that proves Peter to be the author.

It is acknowledged, however, that all this evidence is merely internal; for we have not been able to find any external evidence upon the ſubject. If, therefore, the credit which we give to any fact is to be in proportion to the degree of evidence with which it is accompanied, we ſhall allow more authority due to the goſpels than to the epiſtles; more to thoſe epiſtles which have been generally acknowledged than to thoſe which have been controverted; and therefore no doctrine of Chriſtianity ought to be founded ſolely upon them. It may alſo be added, that perhaps the beſt way of determining what are the eſſential doctrines of Chriſtianity would be to examine what are the doctrines which occur ofteneſt in the goſpels; for the goſpels are the plaineſt parts of the New Teſtament; and their authenticity is moſt completely proved. They are therefore beſt fitted for common readers. Nor will it be denied, we preſume, that our Saviour taught all the doctrines of the Chriſtian religion himſelf; that he repeated them on different occaſions, and inculcated them with an earneſtneſs proportionable to their importance. The Epiſtles are to be conſidered as a commentary on the eſſential doctrines of the goſpel, adapted to the ſituation and circumſtances of particular churches, and perhaps ſometimes explaining doctrines of inferior importance. 1. The eſſential doctrines are therefore firſt to be ſought for in the goſpels, and to be determined by the number of times they occur. 2. They are to be ſought for, in the next place, in the uncontroverted Epiſtles, in the ſame manner. 3. No eſſential doctrine ought to be founded on a ſingle paſſage, nor on the authority of a controverted Epiſtle.

That Peter was old, and near his end, when he wrote this Epiſtle, may be inferred from chap. i. 14. "Knowing that ſhortly I muſt put off this tabernacle, even as our Lord Jeſus has ſhown me." Lardner thinks it was written ſoon after the former. Others, perhaps with more accuracy, date it in 67.

232 Deſign of it.

The general deſign of this Epiſtle is, to confirm the doctrines and inſtructions delivered in the former; "to excite the Chriſtian converts to adorn, and ſtedfaſtly ad-

Scripture.

here to their holy religion, as a religion proceeding from God, notwithstanding the artifices of false teachers, whose character is at large described; or the persecution of their bitter and inveterate enemies."

233 First Epistle of John. Its authenticity and style.

The first Epistle of John is ascribed by the unanimous suffrage of the ancients to the beloved disciple of our Lord. It is referred to by Polycarp; is quoted by Papias, by Irenæus; and was received as genuine by Clemens Alexandrinus, by Dionysius of Alexandria, by Cyprian, by Origen, and Eusebius. There is such a resemblance between the style and sentiments of this Epistle and those of the Gospel according to John, as to afford the highest degree of internal evidence that they are the composition of the same author. In the style of this apostle there is a remarkable peculiarity, and especially in this Epistle. His sentences, considered separately, are exceeding clear and intelligible; but when we search for their connexion, we frequently meet with greater difficulties than we do even in the Epistles of St Paul. The principal signature and characteristic of his manner is an artless and amiable simplicity, and a singular modesty and candour, in conjunction with a wonderful sublimity of sentiment. His conceptions are apparently delivered to us in the order in which they arose to his own mind, and are not the product of artificial reasoning or laboured investigation.

It is impossible to fix with any precision the *date* of this Epistle, nor can we determine to what persons it was addressed.

234 Design of it.

The leading design of the apostle is to show the insufficiency of faith, and the external profession of religion, separate from morality; to guard the Christians to whom he writes against the delusive arts of the corrupters of Christianity, whom he calls Antichrist; and to inculcate universal benevolence. His admonitions concerning the necessity of good morals, and the inefficacy of external professions, are scattered over the Epistle, but are most frequent in the 1st, 2d, and 3d chapters. The enemies or corrupters of Christianity, against whom he contends, seem to have denied that Jesus was the Messiah, the Son of God (chap. ii. 22. v. 1.), and had actually come into the world in a human form, chap. iv. 2, 3.) The earnestness and frequency with which this apostle recommends the duty of benevolence is remarkable. He makes it the distinguishing characteristic of the disciples of Jesus, the only sure pledge of our love to God, and the only assurance of eternal life, (chap. iii. 14, 15.) Benevolence was his favourite theme, which he affectionately pressed upon others, and constantly practised himself. It was conspicuous in his conduct to his great Master, and in the reciprocal affection which it inspired in his sacred breast. He continued to recommend it in his last words. When his extreme age and infirmities had so wasted his strength that he was incapable to exercise the duties of his office, the venerable old man, anxious to exert in the service of his Master the little strength which still remained, caused himself to be carried to church, and, in the midst of the congregation, he repeated these words, "Little children, love one another."

235 Second and third Epistles of John.

It has been observed by Dr Mill that the second and third Epistles of John are so short, and resemble the first so much in sentiment and style, that it is not worth while to contend about them. The second Epistle consists only of 13 verses; and of these eight may be found in the 1st Epistle, in which the sense or language is precisely the same.

The second Epistle is quoted by Irenæus, and was received by Clemens Alexandrinus. Both were admitted by Athanasius, by Cyril of Jerusalem, and by Jerome. The second is addressed to a woman of distinction, whose name is by some supposed to be *Cyria* (taking κυρια for a proper name), by others *Electa*. The third is inscribed to Gaius, or Caius according to the Latin orthography, who, in the opinion of Lardner, was an eminent Christian, that lived in some city of Asia, not far from Ephesus where St John chiefly resided after his leaving Judea. The time of writing these two Epistles cannot be determined with any certainty. They are so short that an analysis of them is not necessary.

Epistle of Jude, authenticity

The Epistle of Jude is cited by no ancient Christian writer extant before Clemens Alexandrinus, about the year 194; but this author has transcribed eight or ten verses in his Stromata and Pedagogue. It is quoted once by Tertullian about the year 200; by Origen frequently about 230. It was not however received by many of the ancient Christians, on account of a supposed quotation from a book of Enoch. But it is not certain that Jude quotes any book. He only says that *Enoch prophesied, saying, The Lord cometh with ten thousand of his saints.* These might be words of a prophecy preserved by tradition, and inserted occasionally in different writings. Nor is there any evidence that there was such a book as Enoch's prophecies in the time of Jude, though a book of that name was extant in the second and third centuries. As to the date of this Epistle nothing beyond conjecture can be produced.

and design.

The design of it is, by describing the character of the false teachers, and the punishments to which they were liable, to caution Christians against listening to their suggestions, and being thereby perverted from the faith and purity of the gospel.

The Apocalypse, authenticity

The Apocalypse or Revelation has not always been unanimously received as the genuine production of the apostle John. Its authenticity is proved, however, by the testimony of many respectable authors of the first centuries. It is referred to by the martyrs of Lyons: it was admitted by Justin Martyr as the work of the apostle John. It is often quoted by Irenæus, by Theophilus bishop of Antioch, by Clement of Alexandria, by Tertullian, by Origen, and by Cyprian of Carthage. It was also received by heretics, by Novatus and his followers, by the Donatists, and by the Arians. For the first two centuries no part of the New Testament was more universally acknowledged, or mentioned with higher respect. But a dispute having arisen about the millennium, Caius with some others, about the year 212, to end the controversy as speedily and effectually as possible, ventured to deny the authority of the book which had given occasion to it.

The ... of it

The book of Revelation, as we learn from Rev. i. 9. was written in the isle of Patmos. According to the general testimony of ancient authors, John was banished into Patmos in the reign of Domitian, and restored by his successor Nerva. But the book could not be published till after John's release, when he returned to Ephesus. As Domitian died in 96, and his persecution

did not commence till near the end of his reign, the Revelation might therefore be published in 96 or 97.

ercy's Key the New estament.

Here we should conclude; but as the curious reader may desire to be informed how the predictions revealed in this book of St John have usually been interpreted and applied, we shall consistently with our subject subjoin *a key to the prophecies contained in the Revelation*. This is extracted from the learned dissertations of Dr Newton, bishop of Bristol (1): to which the reader is referred for a more full illustration of the several parts, as the conciseness of our plan only admits a short analysis or abridgement of them.

240
r Newton's explication of the prophecies which have been already accomplished.

Nothing of a prophetical nature occurs in the first three chapters, except, 1. What is said concerning the church of Ephesus, that her "candlestick shall be removed out of its place," which is now verified, not only in this, but in all the other Asiatic churches which existed at that time; the light of the gospel having been taken from them, not only by their heresies and divisions from within, but by the arms of the Saracens from without: And, 2. Concerning the church of Smyrna, that she shall "have tribulation ten days;" that is, in prophetic language, "ten years;" referring to the persecution of Dioclesian, which alone of all the general persecutions lasted so long.

The next five chapters relate to the opening of the *Seven Seals*; and by these seals are intimated so many different periods of the prophecy. Six of these seals are opened in the sixth and seventh chapters.

The *first seal* or period is memorable for conquests. It commences with Vespasian, and terminates in Nerva; and during this time Judea was subjugated. The *second seal* is noted for war and slaughter. It commences with Trajan, and continues through his reign, and that of his successors. In this period, the Jews were entirely routed and dispersed; and great was the slaughter and devastation occasioned by the contending parties. The *third seal* is characterized by a rigorous execution of justice, and an abundant provision of corn, wine, and oil. It commences with Septimius Severus. He and Alexander Severus were just and severe emperors, and at the same time highly celebrated for the regard they paid to the felicity of their people, by procuring them plenty of every thing, and particularly corn, wine, and oil. This period lasted during the reigns of the Septimian family. The *fourth seal* is distinguished by a concurrence of evils, such as war, famine, pestilence, and wild beasts; by all which the Roman empire was remarkably infested from the reign of Maximin to that of Dioclesian. The *fifth seal* begins at Dioclesian, and is signalized by the great persecution, from whence arose that memorable era, the Era of Martyrs. With Constantine begins the *sixth seal*, a period of revolutions, pictured forth by great commotions in earth and in heaven, alluding to the subversion of Paganism and the establishment of Christianity. This period lasted from the reign of Constantine the Great to that of Theodosius the First. The *seventh seal* includes under it the remaining parts of the prophecy, and comprehends seven periods distinguished by the sounding of seven trumpets.

As the seals foretold the state of the Roman empire before and till it became Christian, so the trumpets foreshow the fate of it afterwards; each trumpet being an alarm to one nation or other, rousing them up to overthrow that empire.

Four of these trumpets are sounded in the eighth chapter.

At the sounding of the first, Alaric and his Goths invade the Roman empire, besiege Rome twice, and set it on fire in several places. At the sounding of the second, Attila and his Huns waste the Roman provinces, and compel the eastern emperor Theodosius the Second, and the western emperor Valentinian the Third, to submit to shameful terms. At the sounding of the third, Genseric and his Vandals arrive from Africa; spoil and plunder Rome, and set sail again with immense wealth and innumerable captives. At the sounding of the fourth, Odoacer and the Heruli put an end to the very name of the western empire; Theodoric founds the kingdom of the Ostrogoths in Italy; and at last Italy becomes a province of the eastern empire, Rome being governed by a duke under the exarch of Ravenna. As the foregoing trumpets relate chiefly to the downfal of the western empire, so do the two following to that of the eastern. They are sounded in the ninth, tenth, and part of the eleventh chapters. At the sounding of the fifth trumpet, Mahomet, that blazing star, appears, opens the bottomless pit, and with his locusts the Arabians darkens the sun and air. And at the sounding of the sixth, a period not yet finished, the four angels, that is, the four sultans, or leaders of the Turks and Othmans, are loosed from the river Euphrates. The Greek or Eastern empire was cruelly "hurt and tormented" under the fifth trumpet; but under the sixth, it was "slain," and utterly destroyed.

The Latin or Western Church not being reclaimed by the ruin of the Greek or Eastern, but still persisting in their idolatry and wickedness; at the beginning of the tenth chapter, and under the sound of this sixth trumpet, is introduced a vision preparative to the prophecies respecting the Western Church, wherein an angel is represented, having in his hand a little book, or codicil, describing the calamities that should overtake that church. The measuring of the temple shows, that during all this period there will be some true Christians, who will conform themselves to the rule of God's word, even whilst the outer court, that is, the external and more extensive part of this temple or church, is trodden under foot by Gentiles, i. e. such Christians as, in their idolatrous worship and persecuting practice, resemble and outdo the Gentiles themselves. Yet against these corrupters of religion there will always be some true witnesses to protest, who, however they may be overborne at times, and in appearance reduced to death, yet will arise again from time to time, till at last they triumph and gloriously ascend. The eleventh chapter concludes with the sounding of the seventh trumpet.

In

(1) Dissertations on the prophecies which have remarkably been fulfilled, and at this time are fulfilling, in the world, Vol. III. 8vo.

In the twelfth chapter, by the woman bearing a man child is to be underſtood the Chriſtian church; by the great red dragon, the Heathen Roman empire; by the man child whom the woman bore, Conſtantine the Great; and by the war in heaven, the conteſts between the Chriſtian and Heathen religions.

In the thirteenth chapter, by the beaſt with ſeven heads and ten horns, unto whom the dragon gave his power, ſeat, and great authority, is to be underſtood, not Pagan but Chriſtian, not imperial but papal Rome; in ſubmitting to whoſe religion, the world did in effect ſubmit again to the religion of the dragon. The ten-horned beaſt therefore repreſents the Romiſh church and ſtate in general: but the beaſt with two horns like a lamb is the Roman clergy; and that image of the ten-horned beaſt, which the two-horned beaſt cauſed to be made, and inſpired with life, is the pope; whoſe number is 666, according to the numerical powers of the letters conſtituting the Roman name Λατεινος, *Latinus*, or it is equivalent in *Hebrew*, רומיית *Romiith*.

Chapter xiv. By the lamb on Mount Sion is meant Jeſus; by the hundred forty and four thouſand, his church and followers; by the angel preaching the everlaſting goſpel, the firſt principal effort made towards a reformation by that public oppoſition formed againſt the worſhip of ſaints and images by emperors and biſhops in the eighth and ninth centuries; by the angel crying, "Babylon is fallen," the Waldenſes and Albigenſes, who pronounced the church of Rome to be the Apocalyptic Babylon, and denounced her deſtruction; and by the third angel, Martin Luther and his fellow reformers, who proteſted againſt all the corruptions of the church of Rome, as deſtructive to ſalvation. For an account of the doctrines and precepts contained in the Scriptures, See Theology. For proofs of their divine origin, ſee Religion, Prophecy, and Miracles.

SCRIVENER, one who draws contracts, or whoſe buſineſs it is to place money at intereſt. If a ſcrivener is intruſted with a bond, he may receive the intereſt; and if he fails, the obligee ſhall bear the loſs: and ſo it is if he receive the principal and deliver up the bond; for being intruſted with the ſecurity itſelf, it muſt be preſumed that he is truſted with power to receive intereſt or principal; and the giving up the bond on payment of the money ſhall be a diſcharge thereof. But if a ſcrivener ſhall be intruſted with a mortgage deed, he hath only authority to receive the intereſt, not the principal; the giving up the deed in this caſe not being ſufficient to reſtore the eſtate, but there muſt be a reconveyance, &c. It is held, where a ſcrivener puts out his client's money on a bad ſecurity, which upon inquiry might have been eaſily found ſo, yet he cannot in equity be charged to anſwer for the money; for it is here ſaid, no one would venture to put out money of another upon a ſecurity, if he were obliged to warrant and make it good in caſe a loſs ſhould happen, without any fraud in him.

SCROBICULUS cordis, the ſame as Anticardium.

SCROFANELLO, in ichthyology, a name by which ſome have called a ſmall fiſh of the Mediterranean, more uſually known by the name of the *ſcorpena*.

SCROLL, in Heraldry. See that article, Chap. IV. ſect. 9. When the motto relates to the creſt, the ſcroll is properly placed above the achievement; otherwiſe it ſhould be annexed to the eſcutcheon. Thoſe of the order of knighthood are generally placed round ſhields.

SCROPHULA, the king's evil. See Medicine, N° 349.

SCROPHULARIA, Figwort, in botany: A genus of the angioſperma order, belonging to the didynamia claſs of plants; and in the natural method ranking under the 40th order, *Perſonatæ*. The calyx is quinquefid; the corolla almoſt globoſe, and reſupinated; the capſule bilocular. There are ſeveral ſpecies, of which the moſt remarkable are, 1. *Nodoſa*, or the common figwort, which grows in woods and hedges. The root is tuberous; the ſtalks are four or five feet high, and branched towards the top; the leaves are heart-ſhaped, ſerrated, and acute. The flowers are of a dark red colour, ſhaped like a cap or helmet; the lower lip greeniſh: they grow in looſe dichotomous ſpikes or *racemi* at the top of the branches. The leaves have a fetid ſmell and bitter taſte. A decoction of them is ſaid to cure hogs of the meaſles. An ointment made of the root was formerly uſed to cure the piles and ſcrophulous ſores, but is at preſent out of practice. 2. *Aquatica*, water figwort, or betony. The root is fibrous; ſtem erect, ſquare, about four feet high. The leaves are oppoſite, elliptical, pointed, ſlightly ſcalloped, on decurrent footſtalks. Flowers purple, in looſe naked ſpikes. It grows on the ſides of rivulets and other wet places, and has a fetid ſmell, though not ſo ſtrong as the preceding. The leaves are uſed in medicine as a corrector of ſena, and in powder to promote ſneezing. 3. *Scorodonia*, or balm-leaved figwort. The ſtem is erect, ſquare, about two feet high. The leaves are oppoſite, doubly ſerrated. The flowers are duſky purple, in compoſite bunches. It grows on the banks of rivulets, &c. in Cornwall. 4. *Vernalis*, or yellow figwort. The ſtalks are ſquare, hairy, brown, about two feet high. The leaves are heart-ſhaped, roundiſh, hairy, indented, oppoſite. The flowers are yellow, on ſingle forked footſtalks from the alæ of the leaves. It grows in hedges in Surry.

SCROTUM. See Anatomy, N° 107.

SCRUPI, in natural hiſtory, the name of a claſs of foſſils, formed in detached maſſes, without any cruſts; of no determinate figure or regular ſtructure; and compoſed of a cryſtalline or ſparry matter, debaſed by an admixture of earth in various proportions. Under this claſs are comprehended, 1. The *telaugia*. 2. The *patridia*. 3. The *lithozugia*. 4. The *jaſpides* or jaſpers.

SCRUPLE, Scrupulus, or *Scrupulum*, the leaſt of the weights uſed by the ancients, which amongſt the Romans was the 24th part of an ounce, or the 3d part of a drachm. The ſcruple is ſtill a weight among

us,

…ple, …tiny.

us, containing the 3d part of a drachm, or 20 grains. Among goldsmiths it is 24 grains.

Scruple, in Chaldean chronology, is $\frac{1}{1080}$ part of an hour, called by the Hebrews *helakin*. These scruples are much used by the Jews, Arabs, and other eastern people, in computations of time.

Scruples of half Duration, an arch of the moon's orbit, which the moon's centre describes from the beginning of an eclipse to its middle.

Scruples of Immersion or *Incidence*, an arch of the moon's orbit, which her centre describes from the beginning of the eclipse to the time when its centre falls into the shadow.

Scruples of Emersion, an arch of the moon's orbit, which her centre describes in the time from the first emersion of the moon's limb to the end of the eclipse.

SCRUTINY, (*Scrutinium*), in the primitive church, an examination or probation practised in the last week of Lent, on the catechumens, who were to receive baptism on the Easter day. The scrutiny was performed with a great many ceremonies. Exorcisms and prayers were made over the heads of the catechumens; and on Palm Sunday, the Lord's Prayer and Creed were given them, which they were afterwards made to rehearse. This custom was more in use in the church of Rome than anywhere else; though it appears, by some missals, to have been likewise used, though much later, in the Gallican church. It is supposed to have ceased about the year 860. Some traces of this practice still remain at Vienne in Dauphiné, and at Liege.

Scrutiny is also used, in the canon law, for a ticket or little paper billet, wherein at elections the electors write their votes privately, so as it may not be known for whom they vote. Among us the term *scrutiny* is chiefly used for a strict perusal and examination of the several votes hastily taken at an election; in order to find out any irregularities committed therein, by unqualified voters, &c.

SCRUTORE, or Scrutoir, (from the French *escritoire*), a kind of cabinet, with a door or lid opening downwards, for conveniency of writing on, &c. Scrutore || Sculponeæ.

SCRY, in falconry, denotes a large flock of fowl.

SCUDDING, the movement by which a ship is carried precipitately before a tempest. As a ship flies with amazing rapidity through the water whenever this expedient is put in practice, it is never attempted in a contrary wind, unless when her condition renders her incapable of sustaining the mutual effort of the wind and waves any longer on her side, without being exposed to the most imminent danger of being overset.

A ship either scuds with a sail extended on her foremast, or, if the storm is excessive, without any sail; which, in the sea phrase, is called *scudding under bare poles*. In sloops and schooners, and other small vessels, the sail employed for this purpose is called the *square-sail*. In large ships, it is either the foresail at large, reefed, or with its goose-wings extended, according to the degree of the tempest; or it is the fore-top sail, close reefed, and lowered on the cap; which last is particularly used when the sea runs so high as to becalm the foresail occasionally, a circumstance which exposes the ship to the danger of broaching-to. The principal hazards incident to scudding are generally, a pooping sea; the difficulty of steering, which exposes the vessel perpetually to the risk of broaching-to; and the want of sufficient sea room. A sea striking the ship violently on the stern may dash it inwards, by which she must inevitably founder. In broaching-to (that is, inclining suddenly to windward), she is threatened with being immediately overturned; and, for want of sea room, she is endangered by shipwreck on a lee shore, a circumstance too dreadful to require explanation.

SCULPONEÆ, among the Romans, a kind of shoes worn by slaves of both sexes. These shoes were only blocks of wood made hollow, like the French *sabots*.

SCULPTURE,

1 Definition of sculpture. Origin of

IS the art of carving wood or hewing stone into images. It is an art of the most remote antiquity, being practised, as there is reason to believe, before the general deluge. We are induced to assign to it this early origin, by considering the expedients by which, in the first stages of society, men have everywhere supplied the place of alphabetic characters. These, it is universally known, have been picture-writing, such as that of the Mexicans, which, in the progress of refinement and knowledge, was gradually improved into the hieroglyphics of the Egyptians and other ancient nations. See Hieroglyphics.

That mankind should have lived near 1700 years, from the creation of the world to the flood of Noah, without falling upon any method to make their conceptions permanent, or to communicate them to a distance, is extremely improbable; especially when we call to mind that such methods of writing have been found, in modern times, among people much less enlightened than those must have been who were capable of building such a vessel as the ark. But if the antediluvians were acquainted with any kind of writing, there can be little doubt of its being hieroglyphical writing. Mr Bryant has proved that the Chaldeans were possessed of that art before the Egyptians; and Berosus * informs us, that a delineation of all the monstrous forms which inhabited the chaos, when this earth was in that state, was to be seen in the temple of Belus in Babylon. This delineation, as he describes it, must have been a history in hieroglyphical characters; for it consisted of human figures with wings, with two heads, and some with the horns and legs of goats. This is exactly similar to the hieroglyphical writing of the Egyptians; and it was preserved, our author says, both in drawings and *engravings* in the temple of the god of Babylon. As Chaldea was the first peopled region of the earth after the flood, and as it appears from Pliny †, as well as from Berosus, that the art of engraving upon bricks baked in the sun was there carried to a considerable degree of perfection at a very early period, the probability certainly

* *Apud Syncellum*, p. 37.

† *Hist. Nat.* lib. 7. cap. 56.

tainty is, that the Chaldeans derived the art of hieroglyphical writing, and consequently the rudiments of the art of sculpture, from their antediluvian ancestors.

2 Not solely from idolatry.

It is generally thought that sculpture had its origin from idolatry, as it was found necessary to place before the people the images of their gods to enliven the fervour of their devotion; but this is probably a mistake. The worship of the heavenly bodies, as the only gods of the heathen nations, prevailed so long before the deification of dead men was thought of (see POLYTHEISM), that we cannot suppose mankind to have been, during all that time, ignorant of the art of hieroglyphical writing. But the deification of departed heroes undoubtedly gave rise to the almost universal practice of representing the gods by images of a human form; and therefore we must conclude, that the elements of sculpture were known before that art was employed to enliven the devotion of idolatrous worshippers. The pyramids and obelisks of Egypt, which were probably temples, or rather altars, dedicated to the sun (see PYRAMID), were covered from top to bottom with hieroglyphical emblems of men, beasts, birds, fishes, and reptiles, at a period prior to that in which there is any unexceptionable evidence that mere statue worship prevailed even in that nursery of idolatry.

3 Though it probably contributed to carry the art to perfection.

But though it appears thus evident that picture-writing was the first employment of the sculptor, we are far from imagining that idolatrous worship did not contribute to carry his art to that perfection which it attained in some of the nations of antiquity. Even in the dark ages of Europe when the other fine arts were almost extinguished, the mummery of the church of Rome, and the veneration which she taught for her saints and martyrs, preserved among the Italians some vestiges of the sister arts of sculpture and painting; and therefore, as human nature is everywhere the same, it is reasonable to believe that a similar veneration for heroes and demigods would, among the ancient nations, have a similar effect. But if this be so, the presumption is that the Chaldeans were the first who invented the art of hewing blocks of wood and stone into the figures of men and other animals; for the Chaldeans were unquestionably the first idolaters, and their early progress in sculpture is confirmed by the united testimonies of Berosus, Alexander Polyhistor, Apollodorus, and Pliny; not to mention the eastern tradition, that the father of Abraham was a statuary.

4 Mr Bromley's theory, that sculpture was invented by the Scythians.

Against this conclusion Mr Bromley, in his late History of the Fine Arts, has urged some plausible arguments. In stating these he professes not to be original, or to derive his information from the fountain head of antiquity. He adopts, as he tells us, the theory of a French writer, who maintains, that in the year of the world 1949, about 300 years after the deluge, the Scythians under Brouma, a descendant of Magog the son of Japhet, extended their conquest over the greater part of Asia. According to this system, Brouma was not only the civilizer of India, and the author of the braminical doctrines, but also diffused the principles of the Scythian mythology over Egypt, Phœnicia, Greece, and the continent of Asia.

Of these principles Mr Bromley has given us no distinct enumeration: the account which he gives of them is not to be found in one place, but to be collected from a variety of distant passages. In attempting, therefore, to present the substance of his scattered hints in one view, we will not be confident that we have omitted none of them. The ox, says he, was the Scythian emblem of the generator of animal life, and hence it became the principal divinity of the Arabians. The serpent was the symbol of the source of intelligent nature. These were the common points of union in all the first religions of the earth. From Egypt the Israelites carried with them a religious veneration for the ox and the serpent. Their veneration for the ox appeared soon after they marched into the wilderness, when in the absence of Moses they called upon Aaron to make them gods which should go before them. The idea of having an idol to go before them, says our author, was completely Scythian; for so the Scythians acted in all their progress through Asia, with this difference, that their idol was a living animal. The Israelites having gained their favourite god, which was an ox (not a calf as it is rendered in the book of Exodus), next proceeded to hold a festival, which was to be accompanied with dancing; a species of gaiety common in the festivals which are held in adoration of the emblematic *Urotal* or ox in that very part of Arabia near Mount Sinai where this event took place. It is mentioned too as a curious and important fact, that the ox which was revered in Arabia was called *Adonai*. Accordingly Aaron announcing the feast to the ox or golden calf, speaks thus, *to-morrow is a feast to Adonai*, which is in our translation rendered *to the Lord*. In the time of Jeroboam we read of the golden calves set up as objects of worship at Bethel and Dan. Nor was the reverence paid to the ox confined to Scythia, to Egypt, and to Asia; it extended much farther. The ancient Cimbri, as the Scythians did, carried an ox of bronze before them on all their expeditions. Mr Bromley also informs us, that as great respect was paid to the living ox among the Greeks as was offered to its symbol among other nations.

The emblem of the serpent, continues Mr Bromley, was marked yet more decidedly by the express direction of the Almighty. That animal had ever been considered as emblematic of the supreme generating power of intelligent life; [illegible] was that idea, says, he, discouraged, so far as it went to be a sign or symbol of life, when God said to Moses, "Make thee a brazen serpent, and set it upon a pole, and it shall come to pass that every one who is bitten, when he looketh upon it, shall live." In Egypt the serpent surrounded their Isis and Osiris, the diadems of their princes, and the bonnets of their priests. The serpent made a distinguished figure in Grecian sculpture. The fable of Echidne, the mother of the Scythians, gave her figure terminating as a serpent to all the founders of states in Greece; from which their earliest sculptors represented in that form the Titan princes, Cecrops, Draco, and even Ericthonius. Besides the spear of the image of Minerva, which Phidias made for the citadel of Athens, he placed a serpent, which was supposed to guard that goddess.

The serpent was combined with many other figures. It sometimes was coiled round an egg as an emblem of the creation; sometimes round a trident, to show its power over the sea; sometimes it encircled a flambeau, to represent life and death.

In Egypt, as well as in Scythia and India, the divinity

vinity was represented on the leaves of the tamara or lotus. Pan was worshipped as a god in that country, as well as over the east. Their sphinxes, and all their combined figures of animal creation, took their origin from the mother of the Scythians, who brought forth an offspring that was half a woman and half a serpent. Their pyramids and obelisks arose from the idea of flame; the first emblem of the supreme principle, introduced by the Scythians, and which even the influence of Zoroaster and the Magi could not remove.

We are told that the Bacchus of the Greeks is derived from the Bruuma of the Indians; that both are represented as seated on a swan swimming over the waves, to indicate that each was the god of humid nature, not the god of wine, but the god of waters. The mitre of Bacchus was shaped like half an egg; an emblem taken from this circumstance, that at the creation the egg from which all things sprung was divided in the middle. Pan also was revered among the Scythians, and from that people were derived all the emblems by which the Greeks represented this divinity.

It would be tedious to follow our author through the whole of this subject; and were we to submit to the labour of collecting and arranging his scattered materials, we should still view his system with some degree of suspicion. It is drawn, as he informs us, from the work of M. D'Ancarville, entitled, *Recherches sur l'Origine, l'Esprit, et les Progres, des Arts de la Grece.*

5 ...unded.

To form conclusions concerning the origin of nations, the rise and progress of the arts and sciences, without the aid of historical evidence, by analogies which are sometimes accidental, and often fanciful, is a mode of reasoning which cannot readily be admitted. There may indeed, we acknowledge, be resemblances in the religion, language, manners, and customs, of different nations, so striking and so numerous, that to doubt of their being descended from the same stock would favour of scepticism. But historical theories must not be adopted rashly. We must be certain that the evidence is credible and satisfactory before we proceed to deduce any conclusions. We must first know whether the Scythian history itself be authentic, before we make any comparison with the history of other nations. But what is called the Scythian history, every man of learning knows to be a collection of fables. Herodotus and Justin are the two ancient writers from whom we have the fullest account of that warlike nation; but these two historians contradict each other, and both write what cannot be believed of the same people at the same period of their progress. Justin tells us, that there was a long and violent contest between the Scythians and Egyptians about the antiquity of their respective nations; and after stating the arguments on each side of the question, which, as he gives them †, are nothing to the purpose, he decides in favour of the claim of the Scythians. Herodotus was too partial to the Egyptians, not to give them the palm of antiquity: and he was probably in the right; for Justin describes his most ancient of nations, even in the time of Darius Hystaspes, as ignorant of the arts of civil life. "They occupied their land in common (says he), and cultivated none of it. They had no houses nor settled habitations, but wandered with their cattle from desert to desert. In these rambles they carried their wives and children in tumbrels covered with the skins of beasts, which served as houses to protect them from the storms of winter. They were without laws, governed by the dictates of natural equity. They coveted not gold or silver like the rest of mankind, and lived upon milk and honey. Though they were exposed to extreme cold, and had abundance of flocks, they knew not how to make garments of wool, but clothed themselves in the skins of wild beasts *." This is the most favourable account which any ancient writer gives of the Scythians. By Strabo † and Herodotus ‖ they are represented as the most savage of mortals, delighting in war and bloodshed, cutting the throats of all strangers who came among them, eating their flesh, and making cups and pots of their skulls. Is it conceivable that such savages could be sculptors; or that, even supposing their manners to have been such as Justin represents them, a people so simple and ignorant could have imposed their mythology upon the Chaldeans, Phenicians, and Egyptians, whom we know by the most incontrovertible evidence to have been great and polished nations so early as in the days of Abraham? No! We could as soon admit other novelties of more importance, with which the French of the present age pretend to enlighten the world, as this origin assigned by Mr Bromley to the art of sculpture, unless supported by better authority than that of D'Ancarville.

...ib. II. ...1.

* Lib. II. cap. 2.
† Lib. VII.
‖ Lib. IV. cap. 62.

The inference of our author from the name of the sacred ox in Arabia, and from the dancing and gaiety which were common in the religious festivals of the Arabians, appears to us to be very hastily drawn. At the early period of the departure of the Israelites from Egypt, the language of the Hebrews, Egyptians, and Arabians, differed not more from each other than do the different dialects of the Greek tongue which are found in the poems of Homer (see Philology, Sect. III.); and it is certain, that for many years after the formation of the golden-calf, the Hebrews were strangers to every species of idolatry but that which they had brought with them from their house of bondage. See Remphan.

Taking for granted therefore that the Scythians did not impose their mythology upon the eastern nations, and that the art of sculpture, as well as hieroglyphic writing and idolatrous worship, prevailed first among the Chaldeans, we shall endeavour to trace the progress of this art through some other nations of antiquity, till we bring it to Greece, where it was carried to the highest perfection to which it has yet attained.

The first intimation that we have of the art of sculpture is in the book of Genesis, where we are informed, that when Jacob, by the divine command, was returning to Canaan, his wife Rachel carried along with her the teraphim or idols of her father. These we are assured were small, since Rachel found it so easy to conceal them from her father, notwithstanding his anxious search. We are ignorant, however, how these images were made, or of what materials they were composed. The first person mentioned as an artist of eminence is Bezaleel, who formed the cherubims which covered the mercy-seat.

6 Egyptian sculpture.

The Egyptians also cultivated the art of sculpture; but there were two circumstances that obstructed its progress, 1. The persons of the Egyptians were not possessed of the graces of form, of elegance, or of symmetry; and of consequence they had no perfect standard to

to model their taſte. They reſembled the Chineſe in the caſt of their face, in their great bellies, and in the clumſy rounding of their contours. 2. They were reſtrained by their laws to the principles and practices of their anceſtors, and were not permitted to introduce any innovations. Their ſtatues were always formed in the ſame ſtiff attitude, with the arms hanging perpendicularly down the ſides. What perfection were they capable of who knew no other attitude than that of chairmen? So far were they from attempting any improvements, that in the time of Adrian the art continued in the ſame rude ſtate as at firſt; and when their ſlaviſh adulation for that emperor induced them to place the ſtatue of his favourite Antinous among the objects of their worſhip, the ſame inanimate ſtiffneſs in the attitude of the body and poſition of the arms was obſerved. We believe it will ſcarcely be neceſſary to inform our readers that the Egyptian ſtatue juſt now mentioned is very different from the celebrated ſtatue of Antinous, of which ſo many moulds have been taken that imitations of it are now to be met with almoſt in every cabinet in Europe.

Notwithſtanding the attachment of the Egyptians to ancient uſages, Winkelman thinks he has diſcovered two different ſtyles of ſculpture which prevailed at different periods. The firſt of theſe ends with the conqueſt of Egypt by Cambyſes. The ſecond begins at that time, and extends beyond the reign of Alexander the Great.

7 First ſtyle. In the firſt ſtyle, the lines which form the contour are ſtraight and projecting a little; the poſition is ſtiff and unnatural: In ſitting figures the legs are parallel, the feet ſqueezed together, and the arms fixed to the ſides; but in the figures of women the left arm is folded acroſs the breaſt; the bones and muſcles are faintly diſcernible; the eyes are flat and looking obliquely, and the eyebrows ſunk; features which deſtroy entirely the beauty of the head; the cheek-bones are high, the chin ſmall and peaked; the ears are generally placed higher than in nature, and the feet are too large and flat. In ſhort, if we are to look for any model in the ſtatues of Egypt, it is not for the model of beauty but of deformity. The ſtatues of men are naked, only they have a ſhort apron, and a few folds of drapery ſurrounding their waiſt: The veſtments of women are only diſtinguiſhable by the border, which riſes a little above the ſurface of the ſtatue. In this age it is evident the Egyptians knew little of drapery.

8 Second ſtyle. Of the ſecond ſtyle of ſculpture practiſed among the Egyptians, Winkelman thinks he has found ſpecimens in the two figures of baſaltes in the Capitol, and in another figure at Villa Albani, the head of which has been renewed. The two firſt of theſe, he remarks, bear viſible traces of the former ſtyle, which appear eſpecially in the form of the mouth and ſhortneſs of the chin. The hands poſſeſs more elegance; and the feet are placed at a greater diſtance from one another, than was cuſtomary in more ancient times. In the firſt and third figures the arms hang down cloſe to the ſides: In the ſecond they hang more freely. Winkelman ſuſpects that theſe three ſtatues have been made after the conqueſt of Egypt by the Greeks. They are clothed with a tunic, a robe, and a mantle. The tunic, which is puckered into many folds, deſcends from the neck to the ground. The robe in the firſt and third ſtatues ſeems cloſe to the body, and is only perceptible by ſome little folds. It is tied under the breaſt, and covered by the mantle, the two buttons of which are placed under the epaulet.

The Antinous of the Capitol is compoſed of two pieces, which are joined under the haunches. But as all the Egyptian ſtatues which now remain have been hewn out of one block, we muſt believe that Diodorus, in ſaying the ſtone was divided, and each half finiſhed by a ſeparate artiſan, ſpoke only of a coloſſus. The ſame author informs us, that the Egyptians divided the human body into $24\frac{1}{4}$ parts; but it is to be regretted that he has not given a more minute detail of that diviſion.

The Egyptian ſtatues were not only formed by the chiſel, they were alſo poliſhed with great care. Even thoſe on the ſummit of an obeliſk, which could only be viewed at a diſtance, were finiſhed with as much labour and care as if they had admitted a cloſe inſpection. As they are generally executed in granite or baſaltes, ſtones of a very hard texture, it is impoſſible not to admire the indefatigable patience of the artiſts.

The eye was often of different materials from the reſt of the ſtatue; ſometimes it was compoſed of a precious ſtone or metal. We are aſſured that the valuable diamond of the empreſs of Ruſſia, the largeſt and moſt beautiful hitherto known, formed one of the eyes of the famous ſtatue of Scheringham in the temple of Brama.

Thoſe Egyptian ſtatues which ſtill remain are compoſed of wood or baked earth: and the ſtatues of earth are covered with green enamel.

9 Phenician ſculpture. The Phenicians poſſeſſed both a character and ſituation highly favourable to the cultivation of ſtatuary. They had beautiful models in their own perſons, and their induſtrious character qualified them to attain perfection in every art for which they had a taſte. Their ſituation raiſed a ſpirit of commerce, and commerce induced them to cultivate the arts. Their temples ſhone with ſtatues and columns of gold, and a profuſion of emeralds was everywhere ſcattered. All the great works of the Phenicians have been unfortunately deſtroyed; but many of the Carthaginian medals are ſtill preſerved, ten of which are depoſited in the cabinet of the grand duke of Florence. But though the Carthaginians were a colony of Phenicians, we cannot from their works judge of the merit of their anceſtors.

10 This art not cultivated among the Perſians. The Perſians made no diſtinguiſhed figure in the arts of deſign. They were indeed ſenſible to the charms of beauty, but they did not ſtudy to imitate them. Their dreſs, which conſiſted of long flowing robes concealing the whole perſon, prevented them from attending to the beauties of form. Their religion, too, which taught them to worſhip the divinity in the emblem of fire, and that it was impious to repreſent him under a human form, ſeemed almoſt to prohibit the exerciſe of this art, by taking away thoſe motives which alone could give it dignity and value; and as it was not cuſtomary among them to raiſe ſtatues to great men, it was impoſſible that ſtatuary could flouriſh in Perſia.

11 Etrurian ſculpture. The Etrurians or ancient Tuſcans, in the opinion of Winkelman, carried this art to ſome degree of perfection at an earlier period than the Greeks. It is ſaid to have been introduced before the ſiege of Troy by Dedalus, who, in order to eſcape the reſentment of Minos king of Crete, took refuge in Sicily, from whence he

paſſed

passed into Italy, where he left many monuments of his art. Pausanias and Diodorus Siculus inform us, that some works ascribed to him were to be seen when they wrote, and that these possessed that character of majesty which afterwards distinguished the labours of Etruria.

A character strongly marked forms the chief distinction in those productions of Etruria which have descended to us. Their style was indeed harsh and overcharged; a fault also committed by Michael Angelo the celebrated painter of modern Etruria; for it is not to be supposed that a people of such rude manners as the Etrurians could communicate to their works that vividness and beauty which the elegance of Grecian manners inspired. On the other hand, there are many of the Tuscan statues which bear so close a resemblance to those of Greece, that antiquarians have thought it probable that they were conveyed from that country or Magna Græcia into Etruria about the time of the Roman conquest, when Italy was adorned with the spoils of Greece.

12 [...]t style. Among the monuments of Etrurian art two different styles have been observed. In the first the lines are straight, the attitude stiff, and no idea of beauty appears in the formation of the head. The contour is not well rounded, and the figure is too slender. The head is oval, the chin peaked, the eyes flat, and looking asquint.

These are the defects of an art in a state of infancy, which an accomplished master could never fall into, and are equally conspicuous in Gothic statues as in the productions of the ancient natives of Florence. They resemble the style of the Egyptians so much, that one is almost induced to suppose that there had once been a communication between these two nations; but others think that this style was introduced by Dedalus.

13 [...]ond [...]e. Winkleman supposes that the second epoch of this art commenced in Etruria, about the time at which it had reached its greatest perfection in Greece, in the age of Phidias: but this conjecture is not supported by any proofs. To describe the second style of sculpture among the Etrurians, is almost the same as to describe the style of Michael Angelo and his numerous imitators. The joints are strongly marked, the muscles raised, the bones distinguishable; but the whole mien harsh. In designing the bone of the leg, and the separation of the muscles of the calf, there is an elevation and strength above life. The statues of the gods are designed with more delicacy. In forming them, the artists were anxious to show that they could exercise their power without that violent distension of the muscles which is necessary in the exertions of beings merely human; but in general their attitudes are unnatural, and the actions strained. If a statue, for instance, hold any thing with its fore fingers, the rest are stretched out in a stiff position.

According to ancient history, the Greeks did not emerge from the savage state till a long time after the Egyptians, Chaldeans, and Indians, had arrived at a considerable degree of civilization. The original rude inhabitants of Greece were civilized by colonies which arrived among them, at different times, from Egypt and Phenicia. These brought along with them the religion, the letters, and the arts of their parent countries; and if sculpture had its origin from the worship of idols, there is reason to believe that it was one of the arts which were thus imported; for that the gods of Greece were of Egyptian and Phenician extraction is a fact incontrovertible (see MYSTERIES, MYTHOLOGY, PHILOLOGY, Sect. VII. PHILOSOPHY, N° 19, and TITAN.). The original statues of the gods, however, were very rude. The earliest objects of idolatrous worship have everywhere been the heavenly bodies; and the symbols consecrated to them were generally pillars of a conical or pyramidal figure. It was not till hero-worship was engrafted on the planetary, that the sculptor thought of giving to the sacred statue any part of the human form (see POLYTHEISM, N° 19, 25); and it appears to have been about the era of this revolution in idolatry that the art of sculpture was introduced among the Greeks. The first representations of their gods were round stones placed upon cubes or pillars; and these stones they afterwards formed roughly, so as to give them something of the appearance of a head. Agreeable to this description was a Jupiter, which Pausanias saw in Tegeum, in Arcadia. These representations were called *Hermes*; not that they represented Mercury, but from the word *herma*, which signified a rough stone. It is the name which Homer gives to the stones which were used to fix vessels to the shore. Pausanias saw at Pheres 30 deities made of unformed blocks or cubical stones. The Lacedemonians represented Castor and Pollux by two parallel posts; and a transverse beam was added, to express their mutual affection.

If the Greeks derived from foreign nations the rudiments of the arts, it must redound much to their honour, that in a few centuries they carried them to such wonderful perfection as entirely to eclipse the fame of their masters. It is by tracing the progress of sculpture among them that we are to study the history of this art; and we shall see its origin and successive improvements correspond with nature, which always operates slowly and gradually.

VIEW OF GRECIAN SCULPTURE.

The great superiority of the Greeks in the art of sculpture may be ascribed to a variety of causes. The influence of climate over the human body is so striking, that it must have fixed the attention of every thinking man who has reflected on the subject. The violent heats of the torrid zone, and the excessive cold of the polar regions, are unfavourable to beauty. It is only in the mild climates of the temperate regions that it appears in its most attractive charms. Perhaps no country in the world enjoys a more serene air, less tainted with mists and vapours, or possesses in a higher degree that mild and genial warmth which can unfold and expand the human body into all the symmetry of muscular strength, and all the delicacies of female beauty in greater perfection, than the happy climate of Greece; and never was there any people that had a greater taste for beauty, or were more anxious to improve it. Of the four wishes of Simonides, the second was to have a handsome figure. The love of beauty was so great among the Lacedemonian women, that they kept in their chambers the statues of Nereus, of Narcissus, of 14 Causes which promoted the art of sculpture in Greece.

Z z [...] Hyacinthus,

Hyacinthus, and of Castor and Pollux; hoping that by often contemplating them they might have beautiful children.

There was a variety of circumstances in the noble and virtuous freedom of the Grecian manners that rendered these models of beauty peculiarly subservient to the cultivation of the fine arts. There were no tyrannical laws, as among the Egyptians, to check their progress. They had the best opportunities to study them in the public places, where the youth, who needed no other veil than chastity and purity of manners, performed their various exercises quite naked. They had the strongest motives to cultivate sculpture, for a statue was the highest honour which public merit could attain. It was an honour ambitiously sought, and granted only to those who had distinguished themselves in the eyes of their fellow citizens. As the Greeks preferred natural qualities to acquired accomplishments, they decreed the first rewards to those who excelled in agility and strength of body. Statues were often raised to wrestlers. Even the most eminent men of Greece, in their youth, sought renown in gymnastic exercises. Chrysippus and Cleanthes distinguished themselves in the public games before they were known as philosophers. Plato appeared as a wrestler both at the Isthmian and Pythian games; and Pythagoras carried off the prize at Elis, (see PYTHAGORAS.) The passion by which they were inspired was the ambition of having their statues erected in the most sacred place of Greece, to be seen and admired by the whole people. The number of statues erected on different occasions was immense; of course the number of artists must have been great, their emulation ardent, and their progress rapid.

As most of their statues were decreed for those who vanquished in the public games, the artists had the opportunity of seeing excellent models; for those who surpassed in running, boxing, and wrestling, must in general have been well formed, yet would exhibit different kinds of beauty.

The high estimation in which sculptors were held was very favourable to their art. Socrates declared the artists the only wise men. An artist could be a legislator, a commander of armies, and might hope to have his statue placed beside those of Miltiades and Themistocles, or those of the gods themselves. Besides, the honour and success of an artist did not depend on the caprice of pride or of ignorance. The productions of art were estimated and rewarded by the greatest sages in the general assembly of Greece, and the sculptor who had executed his work with ability and taste was confident of obtaining immortality.

It was the opinion of Winkelman, that liberty was highly favourable to this art; but, though liberty is absolutely necessary to the advancement of science, it may be doubted whether the fine arts owe their improvement to it. Sculpture flourished most in Greece, when Pericles exercised the power of a king; and in the reign of Alexander, when Greece was conquered. It attained no perfection in Rome till Augustus had enslaved the Romans. It revived in Italy under the patronage of the family of Medici, and in France under the despotic rule of Louis XIV. It is the love of beauty, luxury, wealth, or the patronage of a powerful individual, that promotes the progress of this art.

15 Grecian ideas of beauty.

It will now be proper to give a particular account of the ideas which the Greeks entertained concerning the standard of beauty in the different parts of the human body. And with respect to the head, the profile which they chiefly admired is peculiar to dignified beauty.

16 The profile.

It consists in a line almost straight, or marked by such slight and gentle inflections as are scarcely distinguishable from a straight line. In the figures of women and young persons, the forehead and nose form a line approaching to a perpendicular.

17 The forehead.

Ancient writers, as well as artists, assure us that the Greeks reckoned a small forehead a mark of beauty, and a high forehead a deformity. From the same idea, the Circassians wore their hair hanging down over their foreheads almost to their eyebrows. To give an oval form to the countenance, it is necessary that the hair should cover the forehead, and thus make a curve about the temples; otherwise the face, which terminates in an oval form in the inferior part, will be angular in the higher part, and the proportion will be destroyed. This rounding of the forehead may be seen in all handsome persons, in all the heads of ideal beauty in ancient statues, and especially in those of youth. It has been overlooked, however, by modern statuaries. Bernini, who modelled a statue of Louis XIV. in his youth, turned back the hair from the forehead.

18 The eyes.

It is generally agreed that large eyes are beautiful; but their size is of less importance in sculpture than their form, and the manner in which they are enchased. In ideal beauty, the eyes are always sunk deeper than they are in nature, and consequently the eyebrows have a greater projection. But in large statues, placed at a certain distance, the eyes, which are of the same colour with the rest of the head, would have little effect if they were not sunk. By deepening the cavity of the eye, the statuary increases the light and shade, and thus gives the head more life and expression. The same practice is used in small statues. The eye is a characteristic feature in the heads of the different deities. In the statues of Apollo, Jupiter, and Juno, the eye is large and round. In those of Pallas they are also large; but by lowering the eyelids, the virgin air and expression of modesty are delicately marked. Venus has small eyes, and the lower eyelid being raised a little, gives them a languishing look and an enchanting sweetness. It is only necessary to see the Venus de Medicis to be convinced that large eyes are not essential to beauty, especially if we compare her small eyes with those which resemble them in nature. The beauty of the eyebrows consists in the fineness of the hair, and in the sharpness of the bone which covers them; and masters of the art considered the joining of the eyebrows as a deformity, though it is sometimes to be met with in ancient statues.

19 The mouth.

The beauty of the mouth is peculiarly necessary to constitute a fine face. The lower lip must be fuller than the upper, in order to give an elegant rounding to the chin. The teeth seldom appear, except in laughing satyrs. In human figures the lips are generally close, and a little opened in the figures of the gods. The lips of Venus are half open.

In figures of ideal beauty, the Grecian artists never interrupted the rounding of the chin by introducing a dimple: for this they considered not as a mark of beauty, and only to be admitted to distinguish individuals. The dimple indeed appears in some ancient statues, but antiquaries

antiquaries suspect it to be the work of a modern hand. It is suspected also, that the dimple which is sometimes found on the cheeks of ancient statues is a modern innovation.

20 ears.

No part of the head was executed by the ancients with more care than the ears, though little attention has been given to them by modern artists. This character is so decisive, that if we observe in any statue that the ears are not highly finished, but only roughly marked, we may conclude with certainty that we are examining a modern production. The ancients were very attentive to copy the precise form of the ear in taking likenesses. Thus, where we meet with a head the ears of which have a very large interior opening, we know it to be the head of Marcus Aurelius.

21 hair.

The manner in which the ancient artists formed the hair also enables us to distinguish their works from those of the moderns. On hard and coarse stones the hair was short, and appeared as if it had been combed with a wide comb; for that kind of stone was difficult to work, and could not without immense labour be formed into curled and flowing hair. But the figures executed in marble in the most flourishing period of the art have the hair curled and flowing; at least where the head was not intended to be an exact resemblance, for then the artist conformed to his model. In the heads of women, the hair was thrown back, and tied behind in a waving manner, leaving considerable intervals; which gives the agreeable variety of light and shade, and produces the effects of the claro-obscuro. The hair of the Amazons is disposed in this manner. Apollo and Bacchus have their hair falling down their shoulders; and young persons, till they arrived at manhood, wore their hair long. The colour of the hair which was reckoned most beautiful, was fair; and this they gave without distinction to the most beautiful of their gods, Apollo and Bacchus, and likewise to their most illustrious heroes.

22 hands.

Although the ravages of time have preserved but few of the hands or feet of ancient statues, it is evident from what remains how anxious the Grecian artists were to give every perfection to these parts. The hands of young persons were moderately plump, with little cavities or dimples at the joints of the fingers. The fingers tapered very gently from the root to the point, like well proportioned columns, and the joints were scarcely perceptible. The terminating joint was not bent, as it commonly appears in modern statues.

23 legs and feet.

In the figures of young men the joints of the knee are faintly marked. The knee unites the leg to the thigh without making any remarkable projections or cavities. The most beautiful legs and best turned knees, according to Winkelman, are preserved in the Apollo Sauroctonos, in the Villa Borghese; in the Apollo which has a swan at its feet; and in the Bacchus of Villa Medicis. The same able connoisseur remarks, it is rare to meet with beautiful knees in young persons, or in the elegant representations of art. As the ancients did not cover the feet as we do, they gave to them the most beautiful turning, and studied the form of them with the most scrupulous attention.

The breasts of men were large and elevated. The breasts of women did not possess much amplitude. The figures of the deities have always the breasts of a virgin; the beauty of which the ancients made to consist in a gentle elevation. So anxious were the women to resemble this standard, that they used several arts to restrain the growth of their breasts. The breasts of the nymphs and goddesses were never represented swelling, because that is peculiar to those women who suckle. The paps of Venus contract and end in a point, this being considered as an essential characteristic of perfect beauty. Some of the moderns have transgressed these rules, and have fallen into great improprieties. 24 The breast and lower part of the body.

The lower part of the body in the statues of men was formed like that of the living body after a profound sleep and good digestion. The navel was considerably sunk, especially in female statues.

25 Ideal beauty.

As beauty never appears in equal perfection in every part of the same individual, perfect or ideal beauty can only be produced by selecting the most beautiful parts from different models; but this must be done with such judgment and care, that these detached beauties when united may form the most exact symmetry. Yet the ancients sometimes confined themselves to one individual, even in the most flourishing age. Theodorus, whom Socrates and his disciples visited, served as a model to the artists of his time. Phryne also appears to have been a model to the painters and sculptors. But Socrates, in his conversation with Parrhasius, says, that when a perfect beauty was to be produced, the artists joined together the most striking beauties which could be collected from the finest figures. We know that Zeuxis, when he was going to paint Helen, united in one picture all the beauties of the most handsome women of Crotona.

26 The drapery of statues.

The Grecian sculptors, who represented with such success the most perfect beauty of the human form, were not regardless of the drapery of their statues. They clothed their figures in the most proper stuff, which they wrought into that shape which was best calculated to give effect to their design.

The vestments of women in Greece generally consisted of linen cloth, or some other light stuff, and in latter times of silk and sometimes of woollen cloth. They had also garments embroidered with gold. In the works of sculpture, as well as in those of painting, one may distinguish the linen by its transparency and small united folds. The other light stuffs which were worn by the women (A) were generally of cotton produced in the isle of Cos; and these the art of statuary was able to distinguish from the linen vestments. The cotton cloth was sometimes striped, and sometimes embellished with a profusion of flowers. Silk was also employed; but whether it was known in Greece before the time of the Roman emperors cannot easily be determined. In paintings, it is distinguishable by changing its colour in different lights to red, violet, and sky-blue. There were two sorts of purple; that which the Greeks called the *colour of the sea*, and Tyrian purple, which resembled lac. Woollen garments are easily known by the

(A) Men sometimes wore cotton; but all who did so were reckoned effeminate.

the amplitude of their folds. Besides these, cloth of gold sometimes composed their drapery; but it was not like the modern fabric, consisting of a thread of gold or of silver spun with a thread of silk; it was composed of gold or silver alone, without any mixture.

The vestments of the Greeks, which deserve particular attention, are the tunic, the robe, and the mantle.

27 The tunic. The tunic was that part of the dress which was next to the body. It may be seen in sleeping figures, or in those in dishabille; as in the Flora Farnese, and in the statues of the Amazons in the Capitol. The youngest of the daughters of Niobe, who throws herself at her mother's side, is clothed only with a tunic. It was of linen, or some other light stuff, without sleeves, fixed to the shoulders by a button, so as to cover the whole breast. None but the tunics of the goddess Ceres and comedians have long straight sleeves.

28 The robe. The robes of women commonly consisted of two long pieces of woollen cloth, without any particular form, attached to the shoulders by a great many buttons, and sometimes by a clasp. They had straight sleeves, which came down to the wrists. The young girls, as well as the women, fastened their robe to their side by a cincture, in the same way as the high priest of the Jews fastened his, as it is still done in many parts of Greece. The cincture formed on the side a knot of ribbons sometimes resembling a rose in shape, which has been particularly remarked in the two beautiful daughters of Niobe. In the younger of these the cincture is seen passing over the shoulders and the back. Venus has two cinctures, the one passing over the shoulder, and the other surrounding the waist. The latter is called *cestus* by the poets.

29 The mantle. The mantle was called *peplon* by the Greeks, which signifies properly the mantle of Pallas. The name was afterwards applied to the mantles of the other gods, as well as to those of men. This part of the dress was not square, as some have imagined, but of a roundish form. The ancients indeed speak in general of square mantles, but they received this shape from four tassels which were affixed to them; two of these were visible, and two were concealed under the mantle. The mantle was brought under the right arm, and over the left shoulder: sometimes it was attached to the shoulder by two buttons, as may be seen in the beautiful statue of Leucothoe at Villa Albani.

30 The colour of the vestments. The colour of vestments peculiar to certain statues is too curious to be omitted. To begin with the figures of the gods.—The drapery of Jupiter was red, that of Neptune is supposed by Winkelman to have been sea-green. The same colour also belonged to the Nereids and Nymphs. The mantle of Apollo was blue or violet. Bacchus was dressed in white. Martianus Capella assigns green to Cybele. Juno's vestments were sky-blue, but she sometimes had a white veil. Pallas was robed in a flame-coloured mantle. In a painting of Herculaneum, Venus is in flowing drapery of a golden yellow. Kings were arrayed in purple; priests in white; and conquerors sometimes in sea-green.

With respect to the head, women generally wore no covering but their hair; when they wished to cover their head, they used the corner of their mantle.—Sometimes we meet with veils of a fine transparent texture. Old women wore a kind of bonnet upon their head, an example of which may be seen in a statue in the Capitol, called the *Prefica*; but Winkelman thinks it is a statue of Hecuba.

The covering of the feet consisted of shoes or sandals. The sandals were generally an inch thick, and composed of more than one sole of cork. Those of Pallas in Villa Albani have two soles, and other statues had no less than five.

WINKELMAN has assigned four different styles to this art. The *ancient* style, which continued until the time of Phidias; the *grand* style, formed by that celebrated statuary; the *beautiful*, introduced by Praxiteles, Apelles, and Lysippus; and the *imitative* style, practised by those artists who copied the works of the ancient masters. 31 Four styles of this art among the Greeks.

The most authentic monuments of the ancient style are medals, containing an inscription, which leads us back to very distant times. The writing is from right to left in the Hebrew manner; a usage which was abandoned before the time of Herodotus. The statue of Agamemnon at Elis, which was made by Ornatas, has an inscription from right to left. This artisan flourished 50 years before Phidias; it is in the intervening period therefore between those two artists, that we are to look for the cessation of this practice. The statues formed in the ancient style were neither distinguished by beauty of shape nor by proportion, but bore a close resemblance to those of the Egyptians and Etrurians (B); the eyes were long and flat; the section of the mouth not horizontal; the chin was pointed; the curls of the hair were ranged in little rings, and resembled grains enclosed in a heap of raisins. What was still worse, it was impossible by inspecting the head to distinguish the sex. 32 The ancient style.

The characters of this ancient style were these: The designing was energetic, but harsh; it was animated, but without gracefulness; and the violence of the expression deprived the whole figure of beauty.

The grand style was brought to perfection by Phidias, Polycletus, Scopas, Alcamenes, Myron, and other illustrious artists. It is probable, from some passages of ancient writers, that in this style were preserved some characters of the ancient manner, such as the straight lines, the squares and angles. The ancient masters, such as Polycletus, being the legislators of proportions, says Winkelman, and of consequence thinking they had a right to distribute the measures and dimensions of the parts of the human body, have undoubtedly sacrificed some degree of the form of beauty to a grandeur which is harsh, in comparison of the flowing contours and graceful forms of their successors.—The most considerable monuments of the grand style are the statues of Niobe and her daughters, and a figure 33 The grand style.

(B) This is a proof additional to those that will be found in the articles to which we have referred, that the Greeks received the rudiments of the art of sculpture from the nations to which they were confessedly indebted for the elements of science.

gure of Pallas, to be seen in Villa Albani; which, however must not be confounded with the statue which is modelled according to the first style, and is also found in the same place. The head possesses all the characters of dignified beauty, at the same time exhibiting the rigidness of the ancient style. The face is defective in gracefulness; yet it is evident how easy it would have been to give the features more roundness and grace. The figures of Niobe and her daughters have not, in the opinion of Winkelman, that austerity of appearance which marks the age of the statue of Pallas. They are characterized by grandeur and simplicity; so simple are the forms, that they do not appear to be the tedious productions of art, but to have been created by an instantaneous effort of nature.

34 The graceful style.

The third style was the graceful or beautiful. Lysippus was perhaps the artist who introduced this style. Being more conversant than his predecessors with the sweet, the pure, the flowing, and the beautiful lines of nature, he avoided the square forms which the masters of the second style had too much employed. He was of opinion that the use of the art was rather to please than to astonish, and that the aim of the artist should be to raise admiration by giving delight. The artists who cultivated this style did not, however, neglect to study the sublime works of their predecessors. They knew that grace is consistent with the most dignified beauty, and that it possesses charms which must ever please: they knew also that these charms are enhanced by dignity. Grace is infused into all the movements and attitudes of their statues, and it appears in the delicate turns of the hair, and even in the adjusting of the drapery. Every sort of grace was well known to the ancients; and great as the ravages of time have been amongst the works of art, specimens are still preserved, in which can be distinguished *dignified* beauty, *attractive* beauty, and a beauty *peculiar to infants*. A specimen of dignified beauty may be seen in the statue of one of the muses in the palace of Barberini at Rome; and in the garden of the pope, on the Quirinal, is a statue of another muse, which affords a fine instance of attractive beauty. Winkelman says that the most excellent model of infant beauty which antiquity has transmitted to us is a satyr of a year old, which is preserved, though a little mutilated, in Villa Albani.

35 The imitative style.

The great reputation of Praxiteles and Apelles raised an ardent emulation in their successors, who despairing to surpass such illustrious masters, were satisfied with imitating their works. But it is well known that a mere imitator is always inferior to the master whom he attempts to copy. When no original genius appears, the art must therefore decline.

36 Materials of Grecian statues.

Clay was the first material which was employed in statuary. An instance of this may be seen in a figure of Alcamenes in bas-relief in Villa Albani. The ancients used their fingers, and especially their nails, to render certain parts more delicate and lively: hence arose the phrase *ad unguem factus homo*, "an accomplished man."

37 Clay and plaster.

It was the opinion of Count Caylus that the ancients did not use models in forming their statues. But to disprove this, it is only necessary to mention an engraving on a stone in the cabinet of Stosch, which represents Prometheus engraving the figure of a man, with a plummet in his hand to measure the proportions of his model. The ancients as well as the moderns made works in plaster; but no specimens remain except some figures in bas-relief, of which the most beautiful were found at Baia.

38 Ivory, silver, and gold.

The works made of ivory and silver were generally of a small size. Sometimes, however, statues of a prodigious size were formed of gold and ivory. The colossal Minerva of Phidias, which was composed of these materials, was 26 cubits high. It is indeed scarcely possible to believe that statues of such a size could entirely consist of gold and ivory. The quantity of ivory necessary to a colossal statue is beyond conception. M. de Pauw calculates that the statue of Jupiter Olympius, which was 54 feet high, would consume the teeth of 300 elephants.

39 Marble.

The Greeks generally hewed their marble statues out of one block, though they after worked the heads separately, and sometimes the arms. The heads of the famous group of Niobe and her daughters have been adapted to their bodies after being separately finished. It is proved by a large figure representing a river, which is preserved in Villa Albani, that the ancients first hewed their statues roughly before they attempted to finish any part. When the statue had received its perfect figure, they next proceeded to polish it with pumice-stone, and again carefully retouched every part with the chisel.

40 Porphyry.

The ancients, when they employed porphyry, usually made the head and extremities of marble. It is true, that at Venice there are four figures entirely composed of porphyry; but these are the productions of the Greeks of the middle age. They also made statues of basaltes and alabaster.

41 Expression and attitude.

Without expression, gesture, and attitude, no figure can be beautiful, because in these the graces always reside. It was for this reason that the graces are always represented as the companions of Venus.

The expression of tranquillity was frequent in Grecian statues, because, according to Plato, that was considered as the middle state of the soul between pleasure and pain. Experience too shows that in general the most beautiful persons are endowed with the sweetest and most engaging manner. Without a sedate tranquillity dignified beauty could not exist. It is in this tranquillity, therefore, that we must look for the complete display of genius.

42 in the statues of the gods;

The most elevated species of tranquillity and repose was studied in the figures of the gods. The father of the gods, and even inferior divinities, are represented without emotion or resentment. It is thus that Homer paints Jupiter shaking Olympus by the motion of his hair and his eyebrows.

> Shakes his ambrosial curls, and gives the nod,
> The stamp of fate and sanction of the god.

Jupiter is not always exhibited in this tranquil state. In a bas-relief belonging to the marquis Rondini he appears seated on an arm chair with a melancholy aspect. The Apollo of the Vatican represents the god in a fit of rage against the serpent Python, which he kills at a blow. The artist, adopting the opinion of the poets, has made the nose the seat of anger, and the lips the seat of disdain.

43 in the statues of heroes;

To express the action of a hero, the Grecian sculptors delineated heroes;

delineated the countenance of a noble virtuous character repressing his groans, and allowing no expression of pain to appear. In describing the actions of a hero the poet has much more liberty than the artist. The poet can paint them such as they were before men were taught to subdue their passions by the restraints of law, or the refined customs of social life. But the artist, obliged to select the most beautiful forms, is reduced to the necessity of giving such an expression of the passions as may not shock our feelings and disgust us with his production. The truth of these remarks will be acknowledged by those who have seen two of the most beautiful monuments of antiquity; one of which represents the fear of death, the other the most violent pains and sufferings. The daughters of Niobe against whom Diana has discharged her fatal arrows, are exhibited in that state of stupefaction which we imagine must take place when the certain prospect of death deprives the soul of all sensibility. The fable presents us an image of that stupor which Eschylus describes as seizing the Niobe when they were transformed into a rock. The other monument referred to is the image of Laocoon, which exhibits the most agonizing pain that can affect the muscles, the nerves, and the veins. The sufferings of the body and the elevation of the soul are expressed in every member with equal energy, and form the most sublime contrast imaginable. Laocoon appears to suffer with such fortitude, that, whilst his lamentable situation pierces the heart, the whole figure fills us with an ambitious desire of imitating his constancy and magnanimity in the pains and sufferings that may fall to our lot.

Philoctetes is introduced by the poets shedding tears, uttering complaints, and rending the air with his groans and cries; but the artist exhibits him silent and bearing his pains with dignity. The Ajax of the celebrated painter Timomachus is not drawn in the act of destroying the sheep which he took for the Grecian chiefs, but in the moments of reflection which succeeded that frenzy. So far did the Greeks carry their love of calmness and slow movements, that they thought a quick step always announced rusticity of manners. Demosthenes reproaches Nicobulus for this very thing; and from the words he makes use of, it appears, that to speak with insolence and to walk hastily were reckoned synonymous.

44
In the statues of women.

In the figures of women, the artists have conformed to the principle observed in all the ancient tragedies, and recommended by Aristotle, never to make women show too much intrepidity or excessive cruelty. Conformable to this maxim, Clytemnestra is represented at a little distance from the fatal spot, watching the murderer, but without taking any part with him. In a painting of Timomachus representing Medea and her children, when Medea lifts up the dagger they smile in her face, and her fury is immediately melted into compassion for the innocent victims. In another representation of the same subject, Medea appears hesitating and indecisive. Guided by the same maxims, the artists of most refined taste were careful to avoid all deformity, choosing rather to recede from truth than from their accustomed respect for beauty, as may be seen in several figures of Hecuba. Sometimes, however, she appears in the decrepitude of age, her face furrowed with wrinkles, and her breasts hanging down.

45
In the statues of the Roman emperors.

Illustrious men, and those invested with offices of dignity, are represented with a noble assurance and firm aspect. The statues of the Roman emperors resemble those of heroes, and are far removed from every species of flattery, in the gesture, in the attitude, and action. They never appear with haughty looks, or with the splendour of royalty; no figure is ever seen presenting any thing to them with bended knee, except captives; and none addresses them with an inclination of the head. In modern works too little attention has been paid to the ancient *costume*. Winkelman mentions a bas-relief, which was lately executed at Rome for the fountain of Trevi, representing an architect in the act of presenting the plan of an aqueduct to Marcus Agrippa. The modern sculptor, not content with giving a long beard to that illustrious Roman, contrary to all the ancient marble statues as well as medals which remain, exhibits the architect on his knees.

In general, it was an established principle to banish all violent passions from public monuments. This will serve as a decisive mark to distinguish the true antique from supposititious works. A medal has been found exhibiting two Assyrians, a man and woman tearing their hair, with this inscription, ASSYRIA. ET. PALAESTINA. IN. POTEST. P. R. REDAC. S. C. The forgery of this medal is manifest from the word *Palaestina*, which is not to be found in any ancient Roman medal with a Latin inscription. Besides, the violent action of tearing the hair does not suit any symbolical figure. This extravagant style, which was called by the ancients *Parenthyrsis*, has been imitated by most of the modern artists. Their figures resemble comedians on the ancient theatres, who, in order to suit the distant spectators, put on painted masks, employed exaggerated gestures, and far overleaped the bounds of nature. This style has been reduced into a theory in a treatise on the passions composed by Le Brun. The designs which accompany that work exhibit the passions in the very highest degree, approaching even to frenzy: but these are calculated to vitiate the taste, especially of the young; for the ardour of youth prompts them rather to seize the extremity than the middle; and it will be difficult for that artist who has formed his taste from such impassioned models ever to acquire that noble simplicity and sedate grandeur which distinguished the works of ancient taste.

46
Of proportion.

PROPORTION is the basis of beauty, and there can be no beauty without it; on the contrary, proportion may exist where there is little beauty. Experience every day teaches us that knowledge is distinct from taste; and proportion, therefore, which is founded on knowledge, may be strictly observed in any figure, and yet the figure have no pretensions to beauty. The ancients considering ideal beauty as the most perfect, have frequently employed it in preference to the beauty of nature.

The body consists of three parts as well as the members. The three parts of the body are the trunk, the thighs, and the legs. The inferior parts of the body are the thighs, the legs, and the feet. The arms also consist of three parts. These three parts must bear a certain proportion to the whole as well as to one another. In a well formed man the head and body must be proportioned to the thighs, the legs, and the feet, in the same manner as the thighs are proportioned to the legs and the feet, or the arms to the hands. The face

also consists of three parts, that is, three times the length of the nose; but the head is not four times the length of the nose, as some writers have asserted. From the place where the hair begins to the crown of the head are only three-fourths of the length of the nose, or that part is to the nose as 9 to 12.

It is probable that the Grecian, as well as Egyptian artists, have determined the great and small proportions by fixed rules; that they have established a positive measure for the dimensions of length, breadth, and circumference. This supposition alone can enable us to account for the great conformity which we meet with in ancient statues. Winkelman thinks that the foot was the measure which the ancients used in all their great dimensions, and that it was by the length of it that they regulated the measure of their figures, by giving to them six times that length. This in fact is the length which Vitruvius assigns, *Pes vero altitudinis corporis sexta*, l. 3. cap. 1. That celebrated antiquary thinks the foot is a more determinate measure than the head or the face, the parts from which modern painters and sculptors too often take their proportions. This proportion of the foot to the body, which has appeared strange and incomprehensible to the learned Huetius, and has been entirely rejected by Perrault, is however founded upon experience. After measuring with great care a vast number of figures, Winkelman found this proportion observed not only in Egyptian statues, but also in those of Greece. This fact may be determined by an inspection of those statues the feet of which are perfect. One may be fully convinced of it by examining some divine figures, in which the artists have made some parts beyond their natural dimensions. In the Apollo Belvidere, which is a little more than seven heads high, the foot is three Roman inches longer than the head. The head of the Venus de Medicis is very small, and the height of the statue is seven heads and a half: the foot is three inches and a half longer than the head, or precisely the sixth part of the length of the whole statue.

Practice of Sculpture.

47 Grecian sculpture to be studied by the modern artists.

We have been thus minute in our account of the Grecian sculpture, because it is the opinion of the ablest critics that modern artists have been more or less eminent as they have studied with the greater or less attention the models left us by that ingenious people: Winkelman goes so far as to contend, that the most finished works of the Grecian masters ought to be studied in preference even to the works of nature. This appears to be paradoxical; but the reason assigned by the Abbé for his opinion is, that the fairest lines of beauty are more easily discovered, and make a more striking and powerful impression, by their re-union in these sublime copies, than when they are scattered far and wide in the original. Allowing, therefore, the study of nature the high degree of merit it so justly claims, it must nevertheless be granted, that it leads to true beauty by a much more tedious, laborious, and difficult path, than the study of the *antique*, which presents immediately to the artist's view the object of his researches, and combines in a clear and strong point of light the various rays of beauty that are dispersed through the wide domain of nature.

As soon as the artist has laid this excellent foundation, acquired an intimate degree of familiarity with the beauties of the Grecian statues, and formed his taste after the admirable models they exhibit, he may then proceed with advantage and assurance to the imitation of nature. The ideas he has already formed of the perfection of nature, by observing her dispersed beauties combined and collected in the compositions of the ancient artists, will enable him to acquire with facility, and to employ with advantage, the detached and partial ideas of beauty which will be exhibited to his view in a survey of nature in her actual state. When he discovers these partial beauties, he will be capable of combining them with those perfect forms of beauty with which he is already acquainted. In a word, by having always present to his mind the noble models already mentioned, he will be in some measure his own oracle, and will draw rules from his own mind.

48 Two ways of imitating nature.

There are, however, two ways of imitating nature. In the one a single object occupies the artist, who endeavours to represent it with precision and truth; in the other, certain lines and features are taken from a variety of objects, and combined and blended into one regular whole. All kinds of copies belong to the first kind of imitation; and productions of this kind must be executed necessarily in the Dutch manner, that is to say, with high finishing, and little or no invention. But the second kind of imitation leads directly to the investigation and discovery of true beauty, of that beauty whose idea is connate with the human mind, and is only to be found there in its highest perfection. This is the kind of imitation in which the Greeks excelled, and in which men of genius excite the young artists to excel after their example, viz. by studying nature as they did.

After having studied in the productions of the Grecian masters their choice and expression of select nature, their sublime and graceful contours, their noble draperies, together with that sedate grandeur and admirable simplicity that constitute their chief merit, the curious artists will do well to study the manual and mechanical part of their operations, as this is absolutely necessary to the successful imitation of their excellent manner.

49 Models of statues.

It is certain that the ancients almost always formed their first models in wax: to this modern artists have substituted clay, or some such composition: they prefer clay before wax in the carnations, on account of the yielding nature of the latter, and its sticking in some measure to every thing it touches. We must not, however, imagine from hence that the method of forming models of wet clay was either unknown or neglected among the Greeks; on the contrary, it was in Greece that models of this kind were invented. Their author was Dibutades of Sicyon: and it is well known that Arcesilas, the friend of Lucullus, obtained a higher degree of reputation by his clay models than by all his other productions. Indeed, if clay could be made to preserve its original moisture, it would undoubtedly be the fittest substance for the models of the sculptor; but when it is placed either in the fire or left to dry imperceptibly in the air, its solid parts grow more compact, and the figure losing thus a part of its dimensions, is necessarily reduced to a smaller volume. This diminution would be of no consequence did it equally affect the whole figure, so as to preserve its proportions en-

tire. But this is not the case: for the smaller parts of the figure dry sooner than the larger; and thus losing more of their dimensions in the same space of time than the latter do, the symmetry and proportions of the figure inevitably suffer. This inconveniency does not take place in those models that are made in wax. It is indeed extremely difficult, in the ordinary method of working the wax, to give it that degree of smoothness that is necessary to represent the softness of the carnations or fleshy parts of the body. This inconvenience may, however, be remedied, by forming the model first in clay, then moulding it in plaster, and lastly casting it in wax. And, indeed, clay is seldom used but as a mould in which to cast a figure of plaster, stucco, or wax, to serve henceforth for a model by which the measures and proportions of the statue are to be adjusted. In making waxen models, it is common to put half a pound of colophony to a pound of wax; and some add turpentine, melting the whole with oil of olives.

50 Method of working the marble, and

So much for the first or preparatory steps in this procedure. It remains to consider the manner of working the marble after the model so prepared; and the method here followed by the Greeks seems to have been extremely different from that which is generally observed by modern artists. In the ancient statues we find the most striking proofs of the freedom and boldness that accompanied each stroke of the chisel, and which resulted from the artist's being perfectly sure of the accuracy of his idea, and the precision and steadiness of his hand: the most minute parts of the figure carry these marks of assurance and freedom; no indication of timorousness or diffidence appear; nothing that can induce us to fancy that the artist had occasion to correct any of his strokes. It is difficult to find, even in the second-rate productions of the Grecian artists, any mark of a false stroke or a random touch. This firmness and precision of the Grecian chisel were certainly derived from a more determined and perfect set of rules than those which are observed in modern times.

The method generally observed by the modern sculptor is as follows: First, out of a great block of marble he saws another of the size required, which is performed with a smooth steel saw, without teeth, casting water and sand thereon from time to time; then he fashions it, by taking off what is superfluous with a steel point and a heavy hammer of soft iron; after this, bringing it near the measure required, he reduces it still nearer with another finer point; he then uses a flat cutting instrument, having notches in its edge; and then a chisel to take off the scratches which the former has left; till, at length, taking rasps of different degrees of fineness, by degrees he brings his work into a condition for polishing.

After this, having studied his model with all possible attention, he draws upon this model horizontal and perpendicular lines which intersect each other at right angles. He afterwards copies these lines upon his marble, as the painter makes use of such transversal lines to copy a picture, or to reduce it to a smaller size. These transversal lines or squares, drawn in an equal number upon the marble and upon the model, in a manner proportioned to their respective dimensions, exhibit accurate measures of the surfaces upon which the artist is to work; but cannot determine, with equal precision, the depths that are proportioned to these surfaces.— The sculptor, indeed, may determine these depths by observing the relation they bear to his model; but as his eye is the only guide he has to follow in this estimate, he is always more or less exposed to error, or at least to doubt. He is never sure that the cavities made by his chisel are exact; a degree of uncertainty accompanies each stroke; nor can he be assured that it has carried away neither too much nor too little of his marble. It is equally difficult to determine, by such lines as have already been mentioned, the external and internal contours of the figure, or to transfer them from the model to the marble. By the internal contour is understood that which is described by the parts which approach towards the centre, and which are not marked in a striking manner.

It is farther to be noticed, that in a complicated and laborious work, which an artist cannot execute without assistance, he is often obliged to make use of foreign hands, that have not the talents or dexterity that are necessary to finish his plan. A single stroke of the chisel that goes too deep is a defect not to be repaired; and such a stroke may easily happen, where the depths are so imperfectly determined. Defects of this kind are inevitable, if the sculptor, in chipping his marble, begins by forming the depths that are requisite in the figure he designs to represent. Nothing is more liable to error than this manner of proceeding. The cautious artist ought, on the contrary, to form these depths gradually, by little and little, with the utmost circumspection and care; and the determining of them with precision ought to be considered as the last part of his work, and as the finishing touches of his chisel.

51 of copying ancient statues.

The various inconveniences attending this method determined several eminent artists to look out for one that would be liable to less uncertainty, and productive of fewer errors. The French academy of painting at Rome hit upon a method of copying the ancient statues, which some sculptors have employed with success, even in the figures which they finished after models in clay or wax. This method is as follows: The statue that is to be copied is enclosed in a frame that fits it exactly. The upper part of this frame is divided into a certain number of equal parts, and to each of these parts a thread is fixed with a piece of lead at the end of it. These threads, which hang freely, show what parts of the statue are most removed from the centre with much more perspicuity and precision than the lines which are drawn upon its surface, and which pass equally over the higher and hollow parts of the block: they also give the artist a tolerable rule to measure the more striking variations of height and depth, and thus render him more bold and determined in the execution of his plan.

But even this method is not without its defects: for as it is impossible, by the means of a straight line, to determine with precision the procedure of a curve, the artist has, in this method, no certain rule to guide him in his contours; and as often as the line which he is to describe deviates from the direction of the plumb line, which is his main guide, he must necessarily find himself at a loss, and be obliged to have recourse to conjecture.

It is also evident, that this method affords no certain rule to determine exactly the proportion which the various parts of the figure ought to bear to each other, considered in their mutual relation and connexions. The artist, indeed, endeavours to supply this defect by intersecting

intersecting the plumb lines by horizontal ones. This recourse has, nevertheless, its inconveniences, since the squares formed by transversal lines, that are at a distance from the figure (though they be exactly equal), yet represent the parts of the figure as greater or smaller, according as they are more or less removed from our position or point of view. But, notwithstanding these inconveniences, the method now under consideration is certainly the best that has hitherto been employed: it is more practicable and sure than any other we know, though it appears, from the remarks we have now been making, that it does not exhibit a sure and universal criterion to a sculptor who executes after a model. 52

Of polishing the statue.

To polish the statue, or make the parts of it smooth and sleek, they use pumice stone and smelt; then tripoli; and when a still greater lustre is required, they use burnt straw. For the *Casting of Statues*, see FOUNDERY, and *PLASTER of Paris*.

SCUM, properly denotes the impurities which a liquor, by boiling, casts up to the surface. The term *scum* is also used for what is more properly called the scoria of metals.

SCUPPERS, in a ship, are certain channels cut through the water-ways and sides of a ship, at proper distances, and lined with plated lead, in order to carry the water off from the deck into the sea. The scuppers of the lower deck of a ship of war are usually furnished with a leathern pipe, called the *scupper-hose*, which hangs downward from the mouth or opening of the scupper. The intent of this is to prevent the water from entering when the ship inclines under a weight of sail.

SCURVY, in medicine, see that article, N° 351, where we have given an account of the symptoms, causes, and modes of prevention and cure, according to some of the most eminent writers in medicine. We have here only to add, that, in the opinion of Dr Beddoes, the mineral acids, especially the nitric and vitriolic, may be employed in the prevention or cure of this dreadful disease with as much success as the vegetable acids.—But of all the substances that can at once be cheaply procured and long preserved, he thinks the concrete acid of tartar by far the most promising. It is very grateful, and comes near to the citric acid. In tropical countries the scurvy is seldom known.

Scurvy Grass, in botany. See COCHLEAREA.

The officinalis, or common officinal scurvy grass, grows upon rocks on the sea coast, and on the Highland mountains, abundantly. It has an acrid, bitter, and acid taste, and is highly recommended for the scurvy. There are instances of a whole ship's crew having been cured of that distemper by it; and as it abounds with acid salts, there can be no doubt but that it is a great resister of putrefaction. The best way of taking it is raw in a salad. It is also diuretic, and useful in dropsies. The Highlanders esteem it as a good stomachic.

The coronopus, another species, was some years ago rendered famous, the ashes of it being an ingredient in Mrs Joanna Stephens's celebrated medicine for the stone and gravel; but, unfortunately for those afflicted with that excruciating complaint, it has not been able to support its credit. It is acrid, and tastes like garden cress.

SCUTAGE (*scutagium*, Sax. *scildpening*), was a tax or contribution raised by those that held lands by knights service, towards furnishing the king's army, at one, two, or three merks for every knight's fee. Henry III. for his voyage to the Holy Land, had a tenth granted by the clergy, and *scutage* three merks of every knight's fee by the *laity*. This was also levied by Henry II. Richard I. and King John. See *KNIGHT-Service*.

SCUTE (*scutum*), a French gold coin of 3s. 4d. in the reign of King Henry V. Catharine queen of England had an assurance made her of sundry castles, manors, lands, &c. valued at the sum of 40,000 *scutes*, every two whereof were worth a noble. *Rot. Parl.* 1. *Hen.* VI.

SCUTELLARIA, SKULL-CAP, in botany: A genus of the gymnospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, *Personatæ*. The calyx is short, tubulated, has the mouth entire, and close after flowering. There are two species in Britain, the *galericulata* and *minor*. 1. The *Galericulata*, *Blue Skull-cap*, or *Hooded Willow-herb*. The stems are weak, branched, and above a foot high; the leaves are heart-shaped, narrow-pointed, on short footstalks, and scalloped; the flowers are blue, in pairs, on pedicles from the alæ of the leaves, and pendulous. It grows on the banks of rivers and lakes, is bitter, and has a garlic smell. 2. *Minor*, *little red Skull-cap*, or *Willow herb*. The stalks are about eight inches high; the leaves are heart-shaped, oval: the flowers are purple. It grows in fens, and on the sides of lakes.

SCUTTLES, in a ship, square holes cut in the deck, big enough to let down the body of a man, and which serve upon some occasions to let the people down into any room below, or from one deck to another.

SCYLAX, a celebrated mathematician and geographer of Caria, flourished under the reign of Darius Hystaspes, about 558 B. C. Some have attributed to him the invention of geographical tables. We have under his name a geographical work published by Hoeschelius; but it is written by a much later author, and is perhaps only an abridgment of Scylax's Ancient Geography.

SCYLLA (anc. geog.), a rock in the Fretum Siculum, near the coast of Italy, dangerous to shipping, opposite to Charybdis, a whirlpool on the coast of Sicily; both of them famous in mythology.

Sutherland's Tour up the Straits, Letter xii.

Scylla and Charybdis have been almost subdued by the repeated convulsions of this part of the earth, and by the violence of the current, which is continually increasing the breadth of the straits. If proper allowance be made for these circumstances, we shall acquit the ancients of any exaggeration, notwithstanding the very dreadful colours in which they have painted this passage. It is formed by a low peninsula, called *Cape Pelorus*, stretching to the eastward on the Sicilian side,

immediately within which lies the famous whirlpool of Charybdis, and by the rocks of Scylla, which a few miles below on the Calabrian shore project towards the west. The current runs with surprising force from one to the other alternately in the direction of the tide, and the tides themselves are very irregular. Thus vessels, by shunning the one, were in the utmost danger of being swallowed up by the other.

At present, in moderate weather, when the tide is either at ebb or flood, boats pass all over the whirlpool; but, in general, it is like the meeting of two contending currents, with a number of eddies all around; and, even now, there is scarcely a winter in which there are not some wrecks.

"At the time when we passed the straits (says Captain Sutherland, from whom we have obtained this accurate information) the weather was as favourable as we could wish; and yet, in spite of a strong breeze and the current, which hurried us on with surprising velocity, the ship's head was suddenly whirled round near three points; but the wind blowing fresh, in a few seconds she dashed through the eddy that had caught her; for, to avoid Scylla, and secure Messina, we had kept pretty close to Charybdis."

SCYROS, an island in the Ægean sea, at the distance of about 28 miles north-east from Eubœa. It is 60 miles in circumference. It was originally in the possession of the Pelasgians and Carians. Achilles retired there to avoid going to the Trojan war, and became father of Neoptolemus by Deidamia the daughter of King Lycomedes. Scyros was conquered by the Athenians under Cimon. It was very rocky and barren. Now *Scyro.* E. Long. 25. 0. N. Lat. 38. 15.

SCYTALA LACONICA, in antiquity, a stratagem or device of the Lacedemonians, for the secret writing of letters to their correspondents, so that if they should chance to be intercepted, nobody might be able to read them.—To this end they had two wooden rollers or cylinders, perfectly alike and equal; one whereof was kept in the city, the other by the person to whom the letter was directed. For the letter, a skin of very thin parchment was wrapped round the roller, and thereon was the matter written; which done, it was taken off, and sent away to the party, who, upon putting it in the same manner upon his roller, found the lines and words in the very same disposition as when they were first written. This expedient they set a very high value on; though, in truth, artless and gross enough: the moderns have improved vastly on this method of writing. See CIPHER.

SCYTALIA, in botany: A genus of the monogynia order, belonging to the octandria class of plants; and in the natural method ranking with those that are doubtful. The calyx is very short, monophyllous, and somewhat quinquedentated; the corolla pentapetalous; the filaments hairy at the base; the berry unilocular, with one seed of a soft pulpy consistence. There is only one species, viz. the *Sinensis*, a native of the East Indies.

SCYTHIA, an ancient name for the northern parts of Asia, now known by the name of *Tartary*; also for some of the north-eastern parts of Europe.

This vast territory, which extends itself from the Ister or Danube, the boundary of the Celts, that is, from about the 25th to almost the 110th degree of east longitude, was divided into Scythia in Europe and Scythia in Asia, including, however, the two Sarmatias; or, as they are called by the Greeks, *Sauromatias*, now the Circassian Tartary, which lay between and severed the two Scythias from each other. Sauromatia was also distinguished into European and Asiatic; and was divided from the European Scythia by the river Don or Tanais, which falls into the Palus Meotis; and from the Asiatic by the Rha, now Volga, which empties itself into the Caspian sea.

1. The Asiatic Scythia comprehended, in general, Great Tartary, and Russia in Asia; and, in particular, the Scythia beyond or without Imaus, contained the regions of Bogdoi or Ostiacoi, and Tanguti. That within, or on this side Imaus, had Turkestan and Mongal, the Usbeck or Zagatai, Kalmuc and Nagaian Tartars; besides Siberia, the land of the Samoiedes, and Nova Zemhla. These three last not being so soon inhabited as the former, as may be reasonably supposed, were wholly unknown to the ancients; and the former were peopled by the Bactrians, Sogdians, Gandari, Sacks, and Massagetes. As for Sarmatia, it contained Albania, Iberia, and Colchis; which makes now the Circassian Tartary, and the province of Georgia.

2. Scythia in Europe reached (towards the south-west) to the Po and the Alps, by which it was divided from Celto-Gallia. It was bounded on the south by the Ister or Danube and the Euxine sea. Its northern limits have been supposed to stretch to the spring-heads of the Boristhenes or Nieper, and the Rha or Volga, and so to that of the Tanais.—The ancients divided this country into Scythia Arimaspæa, which lay eastward, joining to Scythia in Asia; and Sarmatia Europeana on the west. In Scythia, properly so called, were the Arimaspæi on the north; the Getæ or Dacians along the Danube, on the south; and the Neuri between these two. So that it contained the European Russia or Muscovy, and the lesser Crim Tartary eastward; and, on the west, Lithuania, Poland, part of Hungary, Transylvania, Walachia, Bulgaria, and Moldavia. Sarmatia is supposed to have reached northward to that part of Swedeland called *Feningia*, now *Finland*; in which they placed the Oœnes, Panoti, and Hippopodes. This part they divided from northern Germany, now the west part of Sweden and Norway, by the *Mare Sarmaticum* or *Scythicum*, which they supposed ran up into the northern ocean, and, dividing Lapland into two parts, formed the western part of Sweden, with Norway, into one island, and Finland into another; supposing this also to be cut off from the continent by the gulf of that name.

Although the ancient Scythians were celebrated as a warlike people, yet their history is too uncertain and obscure to enable us to give any detail which would not prove equally tiresome and uninteresting to the reader. Mr Pinkerton, in a dissertation on their origin endeavours to prove that they were the most ancient of nations; and he assigns for the place of their first habitation the country known by the name of Persia. From Persia, he thinks, they proceeded in numerous hordes westward, surrounded the Euxine, peopled Germany, Italy, Gaul, the countries bordering on the Baltic, with part of Britain and Ireland. That the Scythians were of Asiatic.

atic origin cannot, we think, be questioned; and as Persia was peopled at a very early period, it may not improbably have been their parent country: but when our author contends that their empire had subsisted for more than 1500 years before Ninus the founder of the Assyrian monarchy, and that it extended from Egypt to the Ganges, and from the Persian gulf and Indian sea to the Caspian, we cannot help thinking that his prejudices against the Celts, and his desire to do honour to his favourite Goths, have made him advance a paradox inconsistent with the most authentic records of antiquity. His dissertation however is ingenious, and replete with a variety of curious learning.

SCYTHIAN Lamb, in natural history. See *Scythian Lamb*.

SCYTHROPS, a generical name given by Mr Latham to a bird of which hitherto but one species has been observed. It is about the size of a crow, and two feet three inches in length. The bill is large, convex, furrowed on the sides, and bent at the tip; the nostrils are placed at the base of it, and the tongue is cloven at the end. The general colour of the plumage is a brownish ash, but the tip of each feather of the back, wings, and tail, is black. The tail has each feather banded with black at the end, and the tip itself white; but the inner webs of the feather are marked with black and white bands. The toes are placed two forwards and two backwards, as in the parrot genus. This curious bird is a native of New Holland, and we believe in that part of the world is not uncommon, but its manners are as yet quite unknown. We are happy in being able to present our readers with an engraving of it from an excellent drawing with which we were lately favoured. See plate CCCCXLIX.

SEA, in a strict sense, signifies a large portion of water almost surrounded by land, as the Baltic and Mediterranean seas; but it is frequently used for that vast body of water which encompasses the whole earth.

1 What proportion the superficies of the sea bears to that of the land cannot easily be ascertained. Buffon has supposed that the surface of our globe is equally divided between land and water, and has accordingly calculated the superficies of the sea to be 85,490,506 square miles. But it is now well known that the ocean covers much more than the half of the earth's surface. Buffon believed the existence of a vast southern continent, which Captain Cook has shown to be visionary. It was this circumstance which misled him. According to the most accurate observations hitherto made, the surface of the sea is to the land as three to one; the ocean therefore extends over 128,235,759 square miles, supposing the superficies of the whole globe to be 170,981,012 square miles.

2 To ascertain the depth of the sea is still more difficult than its superficies, both on account of the numerous experiments which it would be necessary to make, and the want of proper instruments for that purpose. Beyond a certain depth the sea has hitherto been found unfathomable; and though several methods have been contrived to obviate this difficulty, none of them has completely answered the purpose. We know in general that the depth of the sea increases gradually as we leave the shore; but if this continued beyond a certain distance, the depth in the middle of the ocean would be prodigious. Indeed the numerous islands everywhere scattered in the sea demonstrate the contrary, by showing us that the bottom of the water is unequal like the land, and that so far from uniformly sinking, it sometimes rises into lofty mountains. If the depth of the sea be in proportion to the elevation of the land, as has generally been supposed, its greatest depth will not exceed five or six miles, for there is no mountain six miles perpendicular above the level of the sea. The sea has never been actually sounded to a greater depth than a mile and 66 feet; every thing beyond that therefore rests entirely upon conjecture and analogical reasoning, which ought never to be admitted to determine a single point that can be ascertained by experiment, because, when admitted, they have too often led to false conclusions. Along the coasts, where the depth of the sea is generally well known, it has always been found proportioned to the height of the shore: when the coast is high and mountainous, the sea that washes it is deep; when, on the contrary, the coast is low, the water is shallow. Whether this analogy holds at a distance from the shore, experiments alone can determine.

3 To calculate the quantity of water contained in the sea, while its depth is unknown, is impossible. But if we suppose with Buffon that its medium depth is the fourth part of a mile, the ocean, if its superficies be 128,235,759 square miles, will contain 32,058,939.75 cubic miles of water.

Let us now endeavour to compute the quantity of water which is constantly discharged into the sea. For this purpose let us take a river whose velocity and quantity of water is known, the Po, for instance, which according to Riccioli is 1000 feet (or 100 perches of Boulogne) broad, 10 feet deep, and runs at the rate of four miles in an hour; consequently that river discharges into the sea 200,000 cubic perches of water in an hour, or 4,800,000 in a day. A cubic mile contains 125,000,000 cubic perches; the Po, therefore will take 26 days to discharge a cubic mile of water into the sea. Let us now suppose what is perhaps not very far from the truth, that the quantity of water which the sea receives from the rivers in any country is proportioned to the extent of that country. The Po from its origin to its mouth traverses a country 380 miles long, and the rivers which fall into it on every side rise from sources about sixty miles distant from it. The Po, therefore, and the rivers which it receives, water a country of 45,600 square miles. Now since the whole superficies of the dry land is about 42,745,253 square miles, it follows, from our supposition, that the quantity of water discharged by all the rivers in the world, in one day, is 36 cubic miles, and in a year 13,140. If therefore the sea contains 32,058,939 cubic miles of water, it would take all the rivers in the world 2439 years to discharge an equal quantity.

4 It may seem surprising that the sea, since it is continually receiving such an immense supply of water, does not visibly increase, and at last cover the whole earth. But our surprise will cease, if we consider that the rivers themselves are supplied from the sea, and that they do nothing more than carry back those waters which the ocean is continually lavishing upon the earth. Dr Halley has demonstrated that the vapours raised from the sea and transported upon land are sufficient to maintain all the rivers in the world. The simplicity of this great process is astonishing: the sea not only connects distant

Margin notes: Scythian Lamb / Sea. — What proportion the surface of the sea bears to that of the land. — Depth of the sea. — Quantity of water which it contains. — Buffon's Theory of the Earth, art. 10. — Why it does not increase.

Sea.

distant countries, and renders it easy to transport the commodities of one nation to another, but its waters rising in the air descend in showers to fertilize the earth and nourish the vegetable kingdom, and collecting into rivers flow onwards, bringing fertility and wealth and commerce along with them, and again return to the sea to repeat the same round.

5
Theories of philosophers on this subject.

The knowledge of this process of nature might, one would think, have convinced philosophers that the proportion between sea and land continued always nearly the same. Philosophers however have formed different theories about this as well as most other subjects, maintaining on the one hand that the sea is continually encroaching on the land, and on the other that the land is constantly gaining on the sea. Both sides have supported their theories by arguments, demonstrations, and uncontrovertible facts!

6
Arguments of those who affirm that the sea is encroaching on the land.

The height of the mountains, say the philosophers who support the encroachments of the sea, is continually diminishing; exposed to the violence of every storm, the hardest rocks must at last give way and tumble down. The rivers are continually sweeping along with them particles of earth which they deposite in the bottom of the sea. Both the depth of the ocean then and the height of the dry land must be always decreasing; the waters therefore must, unless a part of them were annihilated, spread over a greater extent of surface in proportion as these causes operate. This reasoning, convincing as it is, might be confirmed by a great number of facts: it will be sufficient however to mention one or two. In the reign of Augustus the isle of Wight made a part of Britain, so that the English crossed over to it at low water with cart loads of tin; yet that island is at present separated from Britain by a channel half a mile wide. The Godwin sands on the eastern shore of England were formerly the fertile estate of Earl Godwin. Nor are the encroachments of the sea confined to Britain. In the bay of Baiæ near Naples there are remains of houses and streets still visible below the present level of the sea. The sea therefore is making continued encroachments upon the land; and the time will come, say they, when the waters will again cover the surface of the earth.

7
Arguments of those who affirm that the land is gaining on the sea.

Such are the arguments of those philosophers who maintain the continual encroachments of the sea. Those who maintain the opposite theory, that the land is gradually gaining on the sea, though they pretend not to deny the facts advanced by their opponents, affirm that they are altogether insufficient to establish the hypothesis which they were brought forward to support. Though the rivers carry down particles of earth into the sea, these, say they, are either accumulated on other shores, or collecting in the bottom of the ocean, harden into stone, which being possessed of a vegetative power rises by degrees above the surface of the sea and forms rocks, and mountains, and islands. The vegetative nature of stone indeed is sufficient, of itself, to convince us that the quantity of earth must be daily accumulating, and consequently that the surface of the sea is diminishing in extent. Celsius, a Swedish philosopher (for this dispute has been carried on in Sweden with the greatest keenness), has endeavoured to build this theory with more solid materials than vegetable stone. In a curious memoir, published in 1743, he asserts that the Baltic and the Atlantic, at least that part of it which washes Norway, is constantly diminishing; and he proves this by the testimony of a great many aged pilots and fishermen, who affirmed that the sea was become much shallower in many places than it had been during their youth: that many rocks formerly covered with water were now several feet above the surface of the sea: that loaded vessels used formerly to ride in many places where pinnaces and barks could now with difficulty swim. He produces instances of ancient sea port towns now several leagues from the shore, and of anchors and wrecks of vessels found far within the country. He mentions a particular rock which 168 years before was at the bottom of the sea, but was then raised eight feet above its surface. In another place where the water 50 years before had reached to the knee there was then none. Several rocks, too, which during the infancy of some old pilots had been two feet under water, were then three feet above it. From all these observations M. Celsius concludes, that the water of the Baltic decreases in height $4\frac{1}{2}$ lines in a year, 4 inches 5 lines in 18 years, 4 feet 5 inches in a hundred years, and in a thousand years 45 feet. Conscious, however, that these facts, how conclusive soever as far as relates to the Baltic, can never determine the general question, M. Celsius advances another argument in support of his theory. All that quantity of moisture, says he, which is imbibed by plants is lost to the general mass of water, being converted into earth by the putrefaction of vegetables. This notion had been mentioned by Newton, and was adopted by Van Helmont: if granted, it follows as a consequence that the earth is continually increasing and the water diminishing in a very rapid degree.

8
These arguments examined.

Such are the arguments advanced in support of both theories; for it is needless to mention a notion of Linnæus that the whole earth was formerly covered with water except a single mountain. When fairly weighed, they amount to nothing more than this, that the sea has encroached upon the land in some places, and retired in others; a conclusion which we are very willing to allow. What was advanced by those philosophers, who maintain that the sea is continually encroaching on the land, about the depth of the sea constantly diminishing, must remain a mere assertion till they prove by experiments, either that this is really the case, or that nature has no way of restoring those particles of earth which are washed down by the rivers. Nor have they any good reason to affirm that the height of the mountains is decreasing. Can a single uncontrovertible instance be produced of this? Are the Alps or the Apennines, or Taurus, or Caucasus, less lofty now than they were a thousand years ago? We mean not to deny that the rain actually washes down particles of earth from the mountains, nor to affirm that the hardest rocks are able to resist continual storms, nor that many mountains have suffered, and continue to suffer daily, from a thousand accidents. But the effects produced by all these causes are so trifling as to be altogether imperceptible (A). Nature has assiduously guarded against such accidents; she has formed the mountains of the most durable

(A) M. Gensanne pretends that the Pyrenean mountains become an inch lower every ten years. But even according

ble materials; and where they are covered with earth, she has bound it together by a thick and firm matting of grass, and thus secured it from the rains; and should accident deprive it of that covering, she takes care immediately to supply the defect. Even should the earth be swept away together with its covering, nature has still such resources left as frequently restore things to their former state. Many kinds of moss, one would be tempted to think, have been created for this very purpose: they take root and flourish almost upon the bare rock, and furnish as they decay a sufficient bed for several of the hardy Alpine plants. These perish in their turn, and others succeed them. The roots of the plants bind fast the earth as it accumulates, more plants spring up and spread wider, till by degrees the whole surface is covered with a firm coat of grass. Even the rain, which always contains in it a good deal of earth, contributes something to hasten the process.

As the vegetation of stone, an argument advanced by the philosophers who support the opposite theory, is now, we believe, given up by all parties, it is needless to take any farther notice of it here, (see STONE). The hypothesis of M. Celsius, that water is converted into earth, has also shared the same fate, because it was unsupported by experiment, and contrary to every thing that we know either about earth or water. It is a little extraordinary that philosophers have been so lavish of water as to convert it in this manner into stone and earth, when they had given it, one would think, sufficient employment before in making new worlds and in confuting Moses.

9 Bottom of the sea. As the sea covers so great a portion of the globe, we should, no doubt, by exploring its bottom, discover a vast number of interesting particulars. Unfortunately in the greater part of the ocean this has hitherto been impossible. Part, however, has been examined; and the discoveries which this examination has produced may enable us to form some idea at least of the whole. The bottom of the sea, as might have been conjectured indeed beforehand, bears a great resemblance to the surface of the dry land, being, like it, full of plains, rocks, caverns, and mountains; some of which are abrupt and almost perpendicular, while others rise with a gentle declivity, and sometimes tower above the water and form islands. Neither do the materials differ which compose the bottom of the sea and the basis of the dry land. If we dig to a considerable depth in any part of the earth, we uniformly meet with rock; the same thing holds in the sea. The strata, too, are of the same kind, disposed in the same manner, and form indeed but one whole. The same kind of mineral and bituminous substances are also found interspersed with these strata; and it is to them probably that the sea is indebted for its bitter taste. Over these natural and original strata an artificial bed has pretty generally been formed, composed of different materials in different places. It consists frequently of muddy tartareous substances firmly cemented together, sometimes of shells or coral reduced to powder, and near the mouths of rivers it is generally composed of fine sand or gravel. The bottom of the sea resembles the land likewise in another particular: many fresh springs and even rivers rise out of it, which, displacing the salt water, render the lower part of the sea wherever they abound quite fresh. An instance of this kind occurs near Goa on the western coast of Indostan *, and another † in the Mediterranean sea not far from Marseilles. These facts occasioned a notion, which later experiments have exploded, that the sea beyond a certain depth was always fresh.

Sea.

* *Boyle de Fundo Maris.*

† *Marsigli Histoire Physique de la Mer, part. 1.*

Substances of a very beautiful appearance are frequently brought up by the sounding line from the bottom of the sea. The plummet is hollowed below, and this cavity filled with tallow, to which some of the substances adhere which form the bed of the ocean. These are generally sand, gravel, or mud; but they are sometimes of the brightest scarlet, vermilion, purple, and yellow; and sometimes, though less frequently, they are blue, green, or white. These colours are owing to a kind of jelly which envelopes the substances, and vanish entirely as soon as this jelly dries. At times, however, they assume the appearance of tartareous crusts, and are then so permanent, that they can be received into white wax melted and poured round them, and perhaps by proper care might be converted into valuable paints.

10 Colour of the sea. Sea water is really, as any one may convince himself by pouring it into a glass, as clear and transparent as river water. The various appearances therefore which it assumes are owing to accidental causes, and not to any change in the water itself. The depth, or the materials which compose the bottom of the sea, occasions it to assume different colours in different places. The Arabian gulf, for instance, is said to be red from the colour of the sands which form its bed. The appearance of the sea is affected too by the winds and the sun, while the clouds that pass over it communicate all their various and fleeting colours. When the sun shines it is green; when the sun gleams through a fog it is yellow; near the north pole it appears black; while in the torrid zone its colour is often brown. Sometimes the sea assumes a luminous appearance. See LIGHT, N° 37.

11 Saltness of the sea. The sea contains the greatest quantity of salt in the torrid zone, where otherwise from the excessive heat it would be in danger of putrefaction: as we advance northward this quantity diminishes, till at the pole it nearly vanishes altogether. Under the line Lucas found that the sea contained a seventh part of solid contents, consisting chiefly of sea salt. At Harwich he found it yielded $\frac{1}{32}$th of sea salt. At Carlscroon in Sweden it contains $\frac{1}{70}$th part (B), and on the coast of Greenland a great deal less. This deficiency of salt near the poles probably contributes a good deal towards the prodigious quantities of ice which are met with in these seas; for

cording to his own calculation, it would require a million of years to level these mountains with the plain, though they continued to decrease at the same rate; and philosophers tell us that this rate is constantly diminishing!

(B) This gradual diminution of saltness from the equator to the pole is not, however, without particular exceptions. The Mediterranean sea contains $\frac{1}{27}$ of sea salt, which is less than the German sea contains.

for salt water requires a much greater degree of cold to freeze it than fresh water. It was this circumstance, probably, together with its constant motion, which induced the ancients to believe that the sea never froze. Even among the moderns it has been a generally received opinion, that sea ice is originally formed in rivers. Buffon has made the great quantities of ice with which the South sea abounds an argument for the existence of a continent near the Antarctic pole. But it is now well known that great quantities of ice are formed at a distance from land. Sea ice is of two kinds; field-ice, which extends along the shore, and is only two or three feet thick; and mountain-ice, which abounds in the middle of the ocean. The size of these mountains is sometimes prodigious. The sea ice is always fresh, and has been often of great use to navigators. The weight of sea water is to that of river water as 73 to 70; that is, a cubic foot of sea water weighs 73lb. while the same quantity of river water weighs only 70lb.; but this proportion varies in different places. It is worthy of our attention, too, that the water at the surface of the sea contains less salt than near the bottom; the difference indeed is inconsiderable, but still it is something. The Compte de Marsigli found the same quantity of water, when taken from the bottom of the Mediterranean, to weigh one ounce three pennyweights 51 grains; whereas from the surface it weighed only one ounce three pennyweights 49 grains. He repeated the experiment frequently with nearly the same result.

12 Temperature of the sea.

The sea, with respective temperature, may be divided into two regions: The first begins at the surface of the water, and descends as far as the influence of the sun's rays; the second reaches from thence to the bottom of the sea. In summer the lower region is considerably colder than the upper: but it is probable that during winter the very reverse takes place; at least the Compte de Marsigli found it so repeatedly in the Mediterranean. This naturally results from the situation of the water near the bottom of the sea. Uninfluenced by the changes in the atmosphere, it retains always nearly the same degree of temperature: and this is considerably above congelation; for the lower region of the sea, at least in the temperate parts of the world, was never known to freeze. Captain Ellis let down a sea gage (see GAGE) in latitude 25° 13′ north, and longitude 25° 12′ west, to take the degrees of temperature and saltness of the sea at different depths. It descended 5346 feet, which is a mile and eleven fathoms. He found the sea salter and colder in proportion to its depth till the gage had descended 3900 feet, when the mercury in the thermometer came up at 53; but the water never grew colder, though he let down the gage 2446 feet lower. At the surface the thermometer stood at 84.

Boyle de Temperie Regionum Submarinarum.

Phil. Transf. for 1751, p. 213.

13 The sea has three motions. Motion occasioned by the wind.

The sea has three kinds of motion: 1. The first is that undulation which is occasioned by the wind. This motion is entirely confined to the surface; the bottom even during the most violent storms remains perfectly calm. Mr Boyle has remarked, from the testimony of several divers, that the sea is affected by the winds only to the depth of six feet. It would follow from this, that the height of the waves above the surface does not exceed six feet; and that this holds in the Mediterranean at least, we are informed by the Compte de Marsigli, though he also sometimes observed them, during a very violent tempest, rise two feet higher. It is affirmed by Pliny, and several other ancient writers, that oil calms the waves of the sea; and that divers were accustomed to carry some of it for that purpose in their mouths. This account was always considered by the moderns as a fable, and treated with such contempt, that they did not even deign to put it to the test of experiment, till Dr Franklin accidentally discovered its truth. Happening in 1757 to be in the middle of a large fleet, he observed that the water round one or two vessels was quite calm and smooth, while everywhere else it was very much agitated by the winds. He applied to the captain for an explanation of this phenomenon, who replied, that the cooks, he supposed, had thrown their greasy water out at the scupper holes, and by that means oiled the sides of the vessels in question. This answer did not satisfy the Doctor at first; but recollecting what Pliny had said on the subject, he resolved at least to try the experiment. He did so accordingly in 1762, and found that oil actually calmed the waves of the sea. He repeated the experiment upon Lake Clapham: the oil spread itself with great rapidity upon the surface, but did not produce the desired effect, because, having been thrown in upon the side opposite to the wind, it was immediately driven to the edge of the water. But upon throwing in a like quantity upon the other side of the lake, it calmed in an instant several yards of the surface; and gradually spreading, rendered all that part of the lake, to the extent of at least half an acre, as smooth as glass. The curious effect produced by this liquid may be accounted for by the repulsion which exists between oil and water, and between oil and air, which prevents all immediate contact, all rubbing of the one upon the other.

2. The second kind of motion is that continual tendency which the whole water in the sea has towards the west. It is greater near the equator than about the poles; and indeed cannot be said to take place at all in the northern hemisphere beyond the tropic. It begins on the west side of America, where it is moderate: hence that part of the ocean has been called *Pacific*. As the waters advance westward their motion is accelerated; so that, after having traversed the globe, they strike with great violence on the eastern shore of America. Being stopped by that continent, they turn northward, and run with considerable impetuosity into the gulf of Mexico; from thence they proceed along the coast of North America, till they come to the south side of the great bank at Newfoundland, when they turn off, and run down through the Western Isles. This current is called the *Gulf Stream*. It was first accurately described by Dr Franklin, who remarked also, that the water in it having been originally heated in the torrid zone, cools so gradually in its passage northward, that even the latitude might be found in any part of the stream by means of a thermometer.—This motion of the sea westward has never been explained: it seems to have some connexion with the trade winds and the diurnal revolution of the earth on its axis. 15 Motion towards the west.—Currents.

3. The third and most remarkable motion of the sea is the tide, which is a regular swell of the ocean once every 12 hours, owing, as Newton has demonstrated, to the attraction of the moon. In the middle of the sea the tide seldom rises higher than one or two feet, but on the coast it frequently reaches the height of 45 feet, 16 Motion occasioned by the tide.

feet, and in some places even more. The tide generally rises higher in the evening than in the morning: on the coast of Britain this holds in winter, but in summer the morning tides are highest. In some seas it is said that there are no tides. This cannot be owing to their being surrounded by land, because there is a tide in the lakes of North America. For an explanation of these and other phenomena we refer to the article TIDE.

SEA-Air, that part of the atmosphere which is above the sea.

Sea air has been found salubrious and remarkably beneficial in some distempers. This may be owing to its containing a greater portion of oxigenous gas or vital air, and being less impregnated with noxious vapours than the land. Dr Ingenhousz made several experiments to ascertain the salubrity of sea-air. By mixing equal measures of common air and nitrous air, he found, that at Gravesend, they occupied about 104, or one measure, and $\frac{4}{100}$ of a measure: whereas on sea, about three miles from the mouth of the Thames, two measures of air (one of common and one of nitrous air) occupied from 0.91 to 0.94. He attempted a similar experiment on the middle of the channel between the English coast and Ostend; but the motion of the ship rendered it impracticable. He found that in rainy and windy weather the sea air contained a smaller quantity of vital air than when the weather was calm. On the sea-shore at Ostend it occupied from 94½ to 97; at Bruges he found it at 105; and at Antwerp 109½. Dr Ingenhousz thus concludes his paper:

Phil. Trans. 1780, p 354. "It appears, from these experiments, that the air at sea and close to it is in general purer and fitter for animal life than the air on the land, though it seems to be subject to the same inconstancy in its degree of purity with that of the land: so that we may now with more confidence send our patients, labouring under consumptive disorders, to the sea, or at least to places situated close to the sea, which have no marshes in their neighbourhood. It seems also probable, that the air will be found in general much purer far from the land than near the shore, the former being never subject to be mixed with land air."

Dr Damman, an eminent physician, and professor royal of midwifery at Ghent, told Dr Ingenhousz, that when he was formerly a practitioner at Ostend, during seven years, he found the people there remarkably healthy; that nothing was rarer there than to see a patient labouring under a consumption or asthma, a malignant, putrid, or spotted fever; that the disease to which they are the most subject, is a regular intermittent fever in autumn, when sudden transitions from hot to cold weather happen.

People are in general very healthy at Gibraltar, though there are very few trees near that place; which Dr Ingenhousz thinks is owing to the purity of the air, arising from the neighbourhood of the sea.

Most small islands are very healthy.

At Malta people are little subject to diseases, and live to a very advanced age.

SEA, Dead. See ASPHALTITES.

SEA-Devil. See LOPHIUS.

SEA-Dragon, a monster of a very singular nature. In the Gentleman's Magazine for the year 1749, we have the account of a sea-dragon which was said to be taken between Orford and Southwold, on the coast of Suffolk, and afterwards carried round the country as a curiosity by the fisherman who caught it.

"Its head and tail (says the writer) resemble those of an alligator; it has two large fins, which serve it both to swim and to fly, and though they were so dried that I could not extend them, yet they appear, by the folds, to be shaped like those which painters have given to dragons and other winged monsters that serve as supporters to coats of arms. Its body is covered with impenetrable scales; its legs have two joints, and its feet are hoofed like those of an ass: it has five rows of very white and sharp teeth in each jaw, and is in length about four feet, though it was longer when alive, it having shrunk as it became dry.

"It was caught in a net with mackerel; and being dragged on shore, was knocked down with a stretcher or boat-hook. The net being opened, it suddenly sprung up, and flew above 50 yards; the man who first seized it had several of his fingers bitten off; and the wound mortifying, he died. It afterwards fastened on the man's arm who shows it, and lacerated it so much, that the muscles are shrunk, and the hand and fingers distorted; the wound is not yet healed, and is thought to be incurable. It is said by some to have been described by naturalists under the name of the *Sea-dragon*." See Plate CCCCXLIX.

SEA-Marks. The erection of beacons, light-houses, and sea-marks, is a branch of the royal PREROGATIVE. By 8 Eliz. 13. the corporation of the Trinity house are empowered to set up any beacons or sea-marks wherever they shall think them necessary; and if the owner of the land or any other person shall destroy them, or take down any steeple, tree, or other known sea-mark, he shall forfeit 100l. Sterling; or, in case of inability to pay it, he shall be *ipso facto* outlawed.

SEA-Needle, *Gar fish*. See ESOX.

SEA-Nettle. See *ANIMAL-Flower*.

SEA-Pie, or *Oyster-Catcher*. See HÆMATOPUS.

SEA-Plants, are those vegetables that grow in salt-water within the shores of the sea. The old botanists divided these into three classes. 1. The first class, according to their arrangement, contained the *algæ*, the *fuci*, the *sea-mosses* or *conservas*, and the different species of sponges. 2. The second contained substances of a hard texture, like stone or horn, which seem to have been of the same nature with what we call *zoophyta*, with this difference, that we refer sponges to this class, and not to the first. The third class was the same with our *lithophyta*, comprehending *corals*, *madrepora*, &c. It is now well known that the genera belonging to the

Sea. fecond and third of thefe claffes, and even fome referred to the firft, are not vegetables, but animals, or the productions of animals. See CORALLINA, MADREPORA, SPONGIA. Sea plants, then, properly fpeaking, belong to the clafs of cryptogamia, and the order of algæ; and, according to Bomare, are all comprehended under the genus of fucus. We may alfo add feveral fpecies of the ulva and conferva and the fargazo. The fuci and marine ulvæ are immerfed in the fea, are feffile, and without root. The marine confervæ are either feffile or floating. The fargazo grows beyond foundings.

As fome fpecies of the fucus, when dried and preferved, are extremely beautiful, the curious, and efpecially thofe who profecute the ftudy of botany, muft be anxious to know the beft method of preferving them, without deftroying their colour and beauty. The following method is recommended by M. Mauduyt: Take a fheet of paper, or rather of pafteboard, and cover it with varnifh on both fides; and having rowed in a boat to the rock where the fucus abounds, plunge your varnifhed paper into the water, and, detaching the fucus, receive it upon the paper. Agitate the paper gently in the water, that the plant may be properly fpread over it; and lift them up together foftly out of the water: then fix down with pins the ftrong ftalks, that they may not be difplaced, and leave the plant lying upon the varnifhed paper to dry in the open air. When it is fully dry, the different parts will retain their pofition, and the plant may be preferved within the leaves of a book. If you wifh to free it from the flime and falt which adheres to it, it may be wafhed gently in frefh water, after being removed from the rock on which it grew.

Sea-Serpent, a monftrous creature, faid to inhabit the northern feas about Greenland and the coafts of Norway. The following marvellous account of this monfter is given by Guthrie. "In 1756, one of them was fhot by a mafter of a fhip: its head refembled that of a horfe; the mouth was large and black, as were the eyes, a white mane hanging from its neck: it floated on the furface of the water, and held its head at leaft two feet out of the fea: between the head and neck were feven or eight folds, which were very thick; and the length of this fnake was more than 100 yards, fome fay fathoms. They have a remarkable averfion to the fmell of caftor; for which reafon, fhip, boat, and bark mafters provide themfelves with quantities of that drug, to prevent being overfet, the ferpent's olfactory nerves being remarkably exquifite. The particularities related of this animal would be incredible, were they not attefted upon oath. Egede, a very reputable author, fays, that on the 6th day of July 1734, a large and frightful fea monfter raifed itfelf fo high out of the water that its head reached above the main-top-maft of the fhip; that it had a long fharp fnout, broad paws, and fpouted water like a whale; that the body feemed to be covered with fcales; the fkin was uneven and wrinkled, and the lower part was formed like a fnake. The body of this monfter is faid to be as thick as a hogfhead; his fkin is variegated like a tortoife-fhell; and his excrement, which floats upon the furface of the water, is corrofive." Notwithftanding the belief of Guthrie, and the teftimony which he produces, we cannot help doubting of the exiftence of the fea-ferpent. Its bulk is faid to be fo difproportionate to all the known animals of our globe, that it requires more than ordinary evidence to render it credible; but the evidence which is offered is fo very feeble and unfatisfactory, that no man of found judgment would think it fufficient to eftablifh the truth of an extraordinary fact.

Sea-Sicknefs, a diforder incident to moft perfons on their firft going to fea, occafioned by the agitation of the veffel. In voyages, fea-ficknefs, though it continues in general only for the firft day or two, is extremely harraffing to fome people at intervals, efpecially on any increafed motion of the veffel. Sometimes, by long continuance, it caufes fever, headach, quick pulfe, thirft, white tongue, and a total deprivation of the retention of the ftomach; evils which are always difficult to remove, and frequently terminate only with the voyage. *Mofeley's Tropical Difeafes.*

This indifpofition is confiderably alleviated by a fmall tea fpoonful of ether, taken now and then in a glafs of water, and applying fome of it to the temples and noftrils. The ancient writers recommend acid fruits, bread and vegetables foaked in vinegar, after the ftomach has been cleanfed by vomiting; but not to attempt to fupprefs the vomiting until that end was obtained. An old remedy for fea-ficknefs, and a very common one among failors, is a draught or two of fea water; which, though a difgufting medicine at fuch a time, yet where the firft paffages are foul and loaded, generally produces the defired effect when the perturbation it occafions ceafes.

Sea-Star. See ASTERIAS.

Sea-Urchin. See ECHINUS.

Sea-Water, the falt water of the fea. The principal falts contained in fea water are, 1ft, Common marine or culinary falt, compounded of foffil alkali or foda and marine acid; 2dly, A falt formed by the union of the fame acid with magnefian earth; and, laftly, A fmall quantity of felenite. The quantity of faline matter contained in a pint of fea-water, in the Britifh feas, is, according to Neumann, about one ounce in each pint (A).

The faltnefs of this water is judged to arife from great multitudes both of mines and mountains of falt difperfed here and there in the depths of the fea. Dr Halley fuppofes that it is probable the greateft part of the fea falt, and of all falt lakes, as the Cafpian fea, the Dead fea, the lake of Mexico, and the Titicaca in

(A) In Sir Torbern Bergman's analyfis of fea water taken up in the beginning of June 1776, about the latitude of the Canaries, from the depth of 60 fathoms, the folid contents of a pint of the water were,

		Grs.		ʒ.	℈.	Grs.
Of common falt	-	$253\frac{6}{11}$

Total	-	$330\frac{9}{11}$				

in Peru, derived from the water of the rivers which they receive: and since this sort of lakes has no exit or discharge but by the exhalation of vapours, and also since these vapours are entirely fresh or devoid of such particles, it is certain that the saltness of the sea and of such lakes must from time to time increase; and therefore the saltness at this time must be greater than at any time heretofore. He further adds, that if, by experiments made in different ages, we could find the different quantity of salt which the same quantity of water (taken up in the same place, and in all other the same circumstances) would afford, it would be easy from thence, by rules of proportion, to find the age of the world very nearly, or the time wherein it has been acquiring its present saltness.

This opinion of Dr Halley is so improbable, that it is surprising so acute a philosopher could have adopted it. That fresh water rivers should in the course of many thousand years produce saltness in the sea, is quite incredible. If this were the case, every sea or great body of water which receives rivers must be salt, and must possess a degree of saltness in proportion to the quantity of water which the rivers discharge. But so far is this from being true, that the Palus Meotis and the great lakes in America do not contain salt but fresh water. It may indeed be objected, that the quantity of salt which the rivers carry along with them and deposite in the sea, must depend on the nature of the soil through which they flow, which may in some places contain no salt at all: and this may be the reason why the great lakes in America and the Palus Meotis are fresh. But to this opinion, which is merely hypothetical, there are insurmountable objections. It is a curious fact that the saltness of the sea is greatest under the line, and diminishes gradually as we advance to the poles: We must therefore suppose, if Dr Halley's theory be true, that the earth contains more salt in the tropical regions than in the temperate zones, and more in the temperate zones than in the frigid; and consequently that the rivers in these different regions contain a quantity of salt proportionable to their distance from the equator. This, however, must first be proved by experiment, and cannot be assumed as an established fact. But there is another circumstance that entirely destroys this theory. If we allow that the sea receives its saltness from the rivers, it must be equally salt or nearly so in every part of the earth. For, according to a simple and well known principle in chemistry, *when any substance is dissolved in water with the assistance of agitation, at whatever part of the water it is introduced, it will be equally diffused through the whole liquid.* Now though it were true that a greater quantity of salt were introduced into the sea under the line than towards the poles, from the constant agitation occasioned by the wind and tide, the salt must soon pervade the whole mass of water. To say that the superior degree of heat in the tropical regions may dissolve a greater quantity of salt, will not destroy our argument; for it is an established principle in chemistry, that cold water will dissolve nearly as great a quantity of salt as hot water can dissolve.

The saltness of the sea has also been ascribed to the solution of subterraneous mines of salt which is supposed to abound in the bottom of the sea and along its shores. But this hypothesis cannot be supported. If the sea were constantly dissolving salt, it would soon become saturated; for it cannot be said that it is deprived of any part of its salt by evaporation, since rain-water is fresh. If the sea were to become saturated, neither fishes nor vegetables could live in it. We must therefore despair of being able to account for the saltness of the sea by second causes; and must suppose that it has been salt from the creation. It is impossible indeed to suppose that the waters of the sea were at any period fresh since the formation of fishes and sea-plants: for as these will not live in water saturated with salt, neither will they live in water that is fresh; we therefore conclude that the saltness of the sea has been nearly the same in all ages. This is the simplest hypothesis of the three that have been mentioned. It explains best the various phenomena, and is involved in fewest difficulties. We shall, however, allow that there may be some exceptions; that the saltness of some seas, or of particular parts of the same sea, may be increased by mines of rock-salt dispersed near its shores.

With regard to the use of this salt property of sea-water, it is observed, that the saltness of the sea preserves its waters pure and sweet, which otherwise would corrupt and stink like a filthy lake, and consequently that none of the myriads of creatures which now live therein could then have a being. From thence also the sea-water becomes much heavier, and therefore ships of greater size and quantity may be used thereon. Salt water also doth not freeze so soon as fresh water, whence the seas are more free for navigation. We have a dissertation, by Dr Russel, concerning the medical uses of sea water in diseases of the glands, &c. wherein the author premises some observations upon the nature of sea water, considered as impregnated with particles of all the bodies it passes over, such as submarine plants, fish, salts, minerals, &c. and saturated with their several effluvia, to enrich it and keep it from putrefaction: whence this fluid is supposed to contract a soapiness; and the whole collection, being pervaded by the sulphureous steams passing through it, to constitute what we call *sea water;* the confessed distinguishing characteristics of which are saltness, bitterness, nitrosity, and unctuosity: whence the author concludes, that it may be justly expected to contribute signally to the improvement of physic. The cases in which our author informs us we are to expect advantage from sea water are, 1. In all recent obstructions of the glands of the intestines and mesentery. 2. All recent obstructions of the pulmonary glands, and those of the viscera, which frequently produce consumptions. 3. All recent glandular swellings of the neck, or other parts. 4. Recent tumours of the joints, if they are not suppurated, or become schirrous or cancerous, and have not carious bones for their cause. 5. Recent defluxions upon the glands of the eyelids. 6. All defœdations of the skin, from an erysipelas to a lepra. 7. Diseases of the glands of the nose, with their usual companion a thickness of the lip. 8. Obstructions of the kidneys, where there is no inflammation, and the stone not large. 9. In recent obstructions of the liver, this method will be proper, where it prevents constipations of the belly, and assists other medicines directed in icterical cases. The same remedy is said to be of signal service in the bronchocele; and is likewise recommended for the prevention of those

Sea.

the bilious colics that ſo frequently affect our mariners.

Preſervation of Sea-Water from Putrefaction. As it is ſometimes neceſſary to preſerve ſea-water in caſks for bathing and other purpoſes, it is of importance to know how to keep it from putrefaction. Many experiments were made to determine this point by Mr Henry, and are recorded in the firſt volume of the Memoirs of the Literary and Philoſophical Society of Mancheſter. His firſt experiment we ſhall here preſent to our readers. To one quart of ſea-water were added two ſcruples of freſh quicklime; to another, half an ounce of common culinary ſalt; and a third was kept as a ſtandard without any addition. The mouths of the bottles being looſely covered with paper, they were expoſed to the action of the ſun in ſome of the hotteſt weather in ſummer. In about a week the ſtandard became very offenſive; and the water, with the additional quantity of ſalt, did not continue ſweet many hours longer; whereas that with lime continued many months without ever exhibiting the leaſt marks of putridity." When he added a dram more of quicklime, the whole of the magneſia contained in the water was ſeparated; and when a further addition was made, a lime-water was immediately formed. He therefore concluded, that two ſcruples of quicklime are ſufficient to preſerve a quart of ſea-water. The proportions, however, may vary a little, according to the ſtrength of the quicklime employed.

1 Different methods of freſhening ſea-water.

Freſhening of Sea-Water. The method of making ſea-water freſh was long a deſideratum in navigation. Many methods have been propoſed for this purpoſe. Mr Appleby publiſhed an account of a proceſs which he had inſtituted in the year 1734. He diſtilled ſea-water with a quantity of *lapis infernalis*, and calcined bones; but this proceſs was ſoon laid aſide, as it was not only difficult in itſelf, but rendered the water unpalatable. Dr Butler propoſed ſoap leys in place of Mr Appleby's ingredients; but the water was ſtill liable to the ſame objection. Dr Stephen Hales recommended powdered chalk; but his method was expenſive, and did not improve the taſte of the water. Dr Lind of Portſmouth diſtilled ſea-water without any ingredient; but as the experiment he made was performed in a veſſel containing only two quarts, with a glaſs receiver in his ſtudy, nothing concluſive can be drawn from it for the uſe of ſailors. At length Dr

2 Dr Irving's.

Irving brought the proceſs to a very high degree of ſimplicity and perfection, by which the water is obtained pure, without much expence of fuel or a complicated apparatus. For this valuable diſcovery he received a reward of 5000l. The advantages of his method remain to be ſtated, which may be reduced to the following: 1. The aboliſhing all ſtills, ſtill-heads, worm-pipes, and their tubes, which occupy ſo much ſpace as to render them totally incompatible with the neceſſary buſineſs of the ſhip; and uſing in the room of theſe the ſhip's kettle or boiler, to the top whereof may occaſionally be applied a ſimple tube, which can be eaſily made on board a veſſel at ſea, of iron plate, ſtove funnel, or tin ſheet; ſo that no ſituation can prevent a ſhip from being completely ſupplied with the means of diſtilling ſea-water. 2. In conſequence of the principles of diſtillation being fully aſcertained, the contrivance of the ſimpleſt means of obtaining the greateſt quantity of diſtilled water, by making the tube ſufficiently large to receive the whole column of vapour, and placing it nearly in a horizontal direction, to prevent any compreſſion of the fluid, which takes place ſo much with the common worm. 3. The adopting of the ſimpleſt and moſt efficacious means of condenſing vapour; for nothing more is required in the diſtillation but keeping the ſurface of the tube always wet, which is done by having ſome ſea-water at hand, and a perſon to dip a mop or ſwab into this water, and paſs it along the upper ſurface of the tube. By this operation the vapour contained in the tube will be entirely condenſed with the greateſt rapidity imaginable; for by the application of the wet mop thin ſheets of water are uniformly ſpread, and mechanically preſſed upon the ſurface of the hot tube; which being converted into vapour make way for a ſucceſſion of freſh ſheets; and thus, both by the evaporation and cloſe contact of the cold water conſtantly repeated, the heat is carried off more effectually than by any other method yet known. 4. The carrying on the diſtillation without any addition, a correct chemical analyſis of ſea-water having evinced the futility of mixing ingredients with it, either to prevent an acid from riſing with the vapour, or to deſtroy any bituminous oil ſuppoſed to exiſt in ſea-water, and to contaminate the diſtilled water, giving it that fiery unpalatable taſte inſeparable from the former proceſſes. 5. The aſcertaining the proper quantity of ſea water that ought to be diſtilled, whereby the freſh water is prevented from contracting a noxious impregnation of metallic ſalts, and the veſſel from being corroded and otherwiſe damaged by the ſalts caking on the bottom of it. 6. The producing a quantity of ſweet and wholeſome water, perfectly agreeable to the taſte, and ſufficient for all the purpoſes of ſhipping. 7. The taking advantage of the dreſſing the ſhip's proviſions, ſo as to diſtil a very conſiderable quantity of water from the vapour, which would otherwiſe be loſt, without any addition of fuel. To ſum up the merits of this method in a few words: the uſe of a ſimple tube, of the moſt eaſy conſtruction, applicable to any ſhip's kettle. The rejecting all ingredients; aſcertaining the proportion of water to be diſtilled, with every advantage of quality, ſaving of fuel, and preſervation of boilers. The obtaining freſh water, wholeſome, palatable, and in ſufficient quantities. Taking advantage of the vapour which aſcends in the kettle while the ſhip's proviſions are boiling. All theſe advantages are obtained by the above mentioned ſimple addition to the common ſhip's kettles. But Dr Irving propoſes to introduce two further improvements. The firſt is a hearth, or ſtove, ſo conſtructed that the fire which is kept up the whole day for the common buſineſs of the ſhip ſerves likewiſe for diſtillation; whereby a ſufficient quantity of water for the economical purpoſes of the ſhip may be obtained, with a very inconſiderable addition to the expence of fuel. The other improvement is that of ſubſtituting, even in the largeſt ſhips, caſt-iron boilers, of a new conſtruction, in the place of coppers.

3 Directions for diſtilling ſea-water.

As ſoon as ſea-water is put into the boiler, the tube is to be fitted either in the top or lid, round which, if neceſſary, a bit of wet linen may be applied, to make it fit cloſe to the mouth of the veſſel; there will be no occaſion for luting, as the tube acts like a funnel in carrying

rying off the vapour. When the water begins to boil, the vapour fhould be allowed to pafs freely for a minute, which will effectually clean the tube and upper part of the boiler. The tube is afterwards to be kept conftantly wet, by paffing a mop or fwab, dipped in fea water, along its upper furface. The wafte water running from the mop may be carried off by means of a board made like a fpout, and placed beneath the tube. The diftillation may be continued till three-fourths of the water be drawn off, and no further. This may be afcertained either by a guage-rod put into the boiler, or by meafuring the water diftilled. The brine is then to be let out. Water may be diftilled in the fame manner while the provifions are boiling. When the tube is made on fhore, the beft fubftance for the purpofe is thin copper well tinned, this being more durable in long voyages than tin-plates. Inftead of mopping, the tube, if required, may have a cafe made alfo of copper, fo much larger in diameter as to admit a thin fheet of water to circulate between them by means of a fpiral copper thread, with a pipe of an inch diameter at each end of the cafe; the lower for receiving cold water, and the upper for carrying it off when heated.

Plate CCCCXLVIII. When only a very fmall portion of room can be conveniently allowed for diftillation, the machine (N° 2.), which is only 27 inches long, may be fubftituted, as was done in this voyage. The principal intention of this machine, however, is to diftil rum and other liquors; for which purpofe it has been employed with extraordinary fuccefs, in preventing an *empyreuma*, or fiery tafte.

Figure 1. reprefents in perfpective a fection of the two boilers taken out of the frame. In the back part at D, E, are feen openings for the cocks. On the top is a diftilling tube A, B, C, five inches diameter at A, and decreafing in fize to three inches at C; the length from B to C is five feet. Near C is a ring to prevent the water which is applied to the furface from mixing with the diftilled water. In the infide of the tube, below B, is a fmall lip or ledging, to hinder the diftilled water from returning into the boiler by the rolling of the fhip.

In figure 2. A, B, C, D, reprefent a vertical fection of a copper box, 27 inches long, feven inches wide, and 11 in height, tinned on the infide. In the bottom F is an aperture about fix inches in diameter, having a ring to fit on the ftill or boiler. The dotted lines which run nearly horizontal, are veffels of thin copper, tinned on the outfide, two feet long, feven inches wide, and three quarters of an inch deep. At G is a funnel to receive cold water, which is conveyed into the veffels by communicating pipes, contrived in fuch a manner as to form a complete and quick circulation of the water through their whole extent. When the water is become hot by the action of the fteam, it is difcharged by the horizontal pipe at A. E is a pipe from which the diftilled water or fpirits run, and is bent in fuch a form that the liquor running from it acts as a valve, and hinders any fteam from efcaping that way. On the top of the box, at H, is a fafety-valve, which prevents any danger from a great accumulation of vapour not condenfed for want of a proper fupply of cold water.

4 Lorgna's method of freshening it by congelation. We fhall now mention a different method, difcovered by the Chevalier Lorgna, by congelation of fea-water. Sea-water requires a very great degree of cold in order to become ice. Our author found that a freezing mixture, made by mixing three parts of pounded ice with two parts of common falt, was quite fufficient to freeze it. The cold produced by this mixture is equal to about 4° below nought of Fahrenheit's thermometer.

A quantity of fea water is never entirely congealed, a portion of it always remaining fluid; and, what is very remarkable, this fluid part is incomparably more full of falt and more naufeous than the reft: hence, if this be feparated from the congealed part, the latter on being melted will be found to contain much lefs falt than it did before congelation. This we fhall call *the water of the firft purification.*

If the water of the firft purification be again congealed, a part of it will remain fluid as in the firft operation. This fluid portion will contain a greater proportion of falt than the reft, which is of courfe more pure, and, being melted, forms the water of the fecond purification. Thus, by repeatedly freezing the fame fea water, and feparating the fluid from the congealed part in every operation, it is at laft perfectly purified, fo as to be entirely diverted of falt, and as fit for drink and other purpofes as the pureft water that is ufed.

At firft the fea water, in order to be congealed, requires a very great degree of cold, as mentioned above, the ice formed in it confifts rather of fcales or filaments than of a compact body, and the quantity of the fluid parts bears a confiderable proportion to the quantity of ice. But as the water, by undergoing the fucceffive congelations, becomes more and more pure, fo it becomes capable of being congealed by a fmaller and fmaller degree of cold; the ice is at the fame time more compact, and in greater quantity; the fluid part at laft becoming very inconfiderable.

Sea-Weed, or *Alga Marina*, is commonly ufed as a manure on the fea coaft, where it can be procured in abundance. The beft fort grows on rocks, and is that from which kelp is made. The next to this is called the *peafy fea-weed*; and the worft is that with a long ftalk. In the neighbourhood of Berwick, the farmers mix it with ftable dung and earth, and thus obtain a great quantity of excellent manure. Sea-weed is found alfo to be a very fit manure for gardens, as it not only enriches them, but deftroys the vermine by which they are ufually infefted.

Sea-Wolf. See ANARRHICAS.

Saltnefs of the Sea. See *Sea-Water.*

South Sea. See *Pacific Ocean*, and *South Sea.*

SEAL, a puncheon, piece of metal, or other matter, ufually either round or oval; whereon are engraven the arms, device, &c. of fome prince, ftate, community, magiftrate, or private perfon, often with a legend or infcription; the impreffion whereof in wax ferves to make acts, inftruments, &c. authentic.

The ufe of feals, as a mark of authenticity to letters and other inftruments in writing, is extremely ancient. We read of it among the Jews and Perfians in the earlieft and moft facred records of hiftory. And in the book of Jeremiah there is a very remarkable inftance, not only of an atteftation by feal, but alfo of the other ufual formalities attending a Jewifh purchafe. In the civil law alfo, feals were the evidence of truth, and were required, on the part of the witneffes at leaft, at the atteftation of every teftament. But in the times of our Saxon anceftors, they were not much in ufe in England. For though Sir Edward Coke relies on an

inftance

Seal.

instance of King Edwyn's making use of a seal about 100 years before the Conquest, yet it does not follow that this was the usage among the whole nation: and perhaps the charter he mentions may be of doubtful authority, from this very circumstance of its being sealed; since we are assured by all our ancient historians that sealing was not then in common use. The method of the Saxons was, for such as could write to subscribe their names, and, whether they could write or not, to affix the sign of the cross: which custom our illiterate vulgar do for the most part to this day keep up, by signing a cross for their mark when unable to write their names. And indeed this inability to write, and therefore making a cross in its stead, is honestly avowed by Cædwalla, a Saxon king, at the end of one of his charters. In like manner, and for the same unsurmountable reason, the Normans, a brave but illiterate nation, at their first settlement in France used the practice of sealing only, without writing their names; which custom continued when learning made its way among them, though the reason for doing it had ceased; and hence the charter of Edward the Confessor to Westminster-abbey, himself being brought up in Normandy, was witnessed only by his seal, and is generally thought to be the oldest sealed charter of any authenticity in England. At the Conquest, the Norman lords brought over into this kingdom their own fashions; and introduced waxen seals only, instead of the English method of writing their names, and signing with the sign of the cross. The impressions of these seals were sometimes a knight on horseback, sometimes other devices; but coats of arms were not introduced into seals, nor indeed used at all till about the reign of Richard I. who brought them from the croisade in the Holy Land, where they were first invented and painted on the shields of the knights, to distinguish the variety of persons of every Christian nation who resorted thither, and who could not, when clad in complete steel, be otherwise known or ascertained.

This neglect of signing, and resting only upon the authenticity of seals, remained very long among us; for it was held in all our books, that sealing alone was sufficient to authenticate a deed: and so the common form of attesting deeds, "sealed and delivered," continues to this day, notwithstanding the statute 29 Car. II. c. 3. revives the Saxon custom, and expressly directs the signing in all grants of lands and many other species of deeds: in which, therefore, signing seems to be now as necessary as sealing, though it hath been sometimes held that the one includes the other.

Sea || Seam.

The king's *great-seal* is that whereby all patents, commissions, warrants, &c. coming down from the king are sealed; the keeping whereof is in the hands of the lord chancellor. The king's *privy-seal* is a seal that is usually first set to grants that are to pass the great seal.

Seal. See *Keeper of the Privy-Seal*.

Seal is also used for the wax or lead, and the impression thereon affixed to the thing sealed.

An amalgam of mercury with gold, reduced to the consistence of butter, by straining off part of the mercury through leather, has been recommended as a proper material for taking off the impression of seals in wax. In this state, the compound scarcely contains one part of mercury to two of gold; yet is of a silver whiteness, as if there was none of the precious metal in it. In this state it grows soft on being warmed or worked between the fingers; and is therefore proper for the purpose above-mentioned, but is not superior to some amalgams made with the inferior metals, as is well known to some impostors, who have sold for this use amalgams of the base metals as curious preparations of gold.

Seal, in zoology. See Phoca.

SEALER, an officer in chancery appointed by the lord chancellor or keeper of the great seal to seal the writs and instruments there made in his presence.

SEALING, in architecture, the fixing a piece of wood or iron in a wall with plaster, mortar, cement, lead, or other solid binding. For staples, hinges, and joints, plaster is very proper.

Sealing Wax. See Wax.

SEAM, or Seme of corn, a measure of eight bushels.

Seam of Glass, the quantity of 120 pounds, or 24 stones, each five pounds weight. The seam of wood is a horse load.

Seam, in mines, the same with a vein or stratum of metal.

SEAMANSHIP.

1 Definition.

BY this word we express that noble art, or, more purely, the qualifications which enable a man to exercise the noble art of working a ship. A seaman, in the language of the profession, is not merely a mariner or labourer on board a ship, but a man who understands the structure of this wonderful machine, and every subordinate part of its mechanism, so as to enable him to employ it to the best advantage for pushing her forward in a particular direction, and for avoiding the numberless dangers to which she is exposed by the violence of the winds and waves. He also knows what courses can be held by the ship, according to the wind that blows, and what cannot, and which of these is most conducive to her progress in her intended voyage; and he must be able to perform every part of the necessary operation with his own hands. As the seamen express it, he must be able "to hand, reef, and steer."

2 Importance and

We are justified in calling it a *noble art*, not only by its importance, which it is quite needless to amplify or embellish, but by its immense extent and difficulty, and the prodigious number and variety of principles on which it is founded—all of which must be possessed in such a manner that they shall offer themselves without reflection in an instant, otherwise the pretended seaman is but a lubber, and cannot be trusted on his watch.

The art is practised by persons without what we call *education*, and in the humbler walks of life, and therefore it suffers in the estimation of the careless spectator. It is thought little of, because little attention is paid

paid to it. But if multiplicity, variety, and intricacy of principles, and a systematic knowledge of these principles, entitle any art to the appellation of *scientific* and *liberal*, seamanship claims these epithets in an eminent degree. We are amused with the pedantry of the seaman, which appears in his whole language. Indeed it is the only pedantry that amuses. A scholar, a soldier, a lawyer, nay, even the elegant courtier, would disgust us, were he to make the thousandth part of the allusions to his profession that is well received from the jolly seaman; and we do the seaman no more than justice. His profession *must* engross his whole mind, otherwise he can never learn it. He possesses a prodigious deal of knowledge; but the honest tar cannot tell what he knows, or rather what he feels, for his science is really at his finger ends. We can say with confidence, that if a person of education, versed in mechanics, and acquainted with the structure of a ship, were to observe with attention the movements which are made on board a first or second rate ship of war during a shifting storm, under the direction of an intelligent officer, he would be rapt in admiration.

3 difficulty of the art,

What a pity it is that an art so important, so difficult, and so intimately connected with the invariable laws of mechanical nature, should be so held by its possessors, that it cannot improve, but must die with each individual. Having no advantages of previous education, they cannot arrange their thoughts; they can hardly be said to think. They can far less express or communicate to others the intuitive knowledge which they possess; and their art, acquired by habit alone, is little different from an instinct. We are as little entitled to expect improvement here as in the architecture of the bee or the beaver. The species (pardon the allusion ye generous hearts of oak) cannot improve. Yet a ship is a machine. We know the forces which act on it, and we know the results of its construction—all these are as fixed as the laws of motion. What hinders this to be reduced to a set of practical maxims, as well founded and as logically deduced as the working of a steam engine or a cotton mill? The stocker or the spinner acts only with his hands, and may "whistle as he works for want of thought;" but the mechanist, the engineer, thinks for him, improves his machine, and directs him to a better practice. May not the rough seaman look for the same assistance; and may not the ingenious speculatist in his closet unravel the intricate thread of mechanism which connects all the manual operations with the unchangeable laws of nature, and both furnish the seaman with a better machine and direct him to a more dexterous use of it?

4 which has been zealously cultivated by the French philosophers.

We cannot help thinking that much may be done; nay, we may say that much has been done. We think highly of the progressive labours of Renaud, Pitot, Bouguer, Du Hamel, Groignard, Bernoulli, Euler, Romme, and others; and are both surprised and sorry that Britain has contributed so little in these attempts. Gordon is the only one of our countrymen who has given a professedly scientific treatise on a small branch of the subject. The government of France has always been strongly impressed with the notion of great improvements being attainable by systematic study of this art; and we are indebted to the endeavours of that ingenious nation for any thing of practical importance that has been obtained. M. Bouguer was professor of hydrology at one of the marine academies of France, and was enjoined, as part of his duty, to compose dissertations both on the construction and the working of ships. His *Traité du Navire*, and his *Manœuvre des Vaisseaux*, are undoubtedly very valuable performances: So are those of Euler and Bernoulli, considered as mathematical dissertations, and they are wonderful works of genius, considered as the productions of persons who hardly ever saw a ship, and were totally unacquainted with the profession of a seaman. In this respect Bouguer had great superiority, having always lived at a sea-port, and having made many very long voyages. His treatises therefore are infinitely better accommodated to the demands of the seaman, and more directly instructive; but still the author is more a mathematician than an artist, and his performance is intelligible only to mathematicians. It is true, the academical education of the young gentlemen of the French navy is such, that a great number of them may acquire the preparatory knowledge that is necessary; and we are well informed that, in this respect, the officers of the British navy are greatly inferior to them.

5 Argument against the utility of their performances;

But this very circumstance has furnished to many persons an argument against the utility of those performances. It is said that, "notwithstanding this superior mathematical education, and the possession of those boasted performances of M. Bouguer, the French are greatly inferior, in point of seamanship, to our countrymen, who have not a page in their language to instruct them, and who could not peruse it if they had it." Nay, so little do the French themselves seem sensible of the advantage of these publications, that no person among them has attempted to make a familiar abridgement of them, written in a way fitted to attract attention; and they still remain neglected in their original abstruse and uninteresting form.

We wish that we could give a satisfactory answer to this observation. It is just, and it is important. These very ingenious and learned dissertations are by no means so useful as we should expect. They are large books, and appear to contain much; and as their plan is logical, it seems to occupy the whole subject, and therefore to have done almost all that can be done. But, alas! they have only opened the subject, and the study is yet in its infancy. The whole science of the art must proceed on the knowledge of the impulsions of the wind and water. These are the forces which act on the machine; and its motions, which are the ultimatum of our research, whether as an end to be obtained or as a thing to be prevented, must depend on these forces. Now it is with respect to this fundamental point that we are as yet almost totally in the dark. And, in the performances of M. Bouguer, as also in those of the other authors we have named, the theory of these forces, by which their quantity and the direction of their action are ascertained, is altogether erroneous; and its results deviate so enormously from what is observed in the motions of a ship, that the person who should direct the operations on shipboard, in conformity to the maxims deducible from M. Bouguer's propositions, would be baffled in most of his attempts, and be in danger of losing the ship. The whole proceeds on the supposed truth of that theory which states the impulse of a fluid

6 which are evidently erroneous in their fundamental principles,

to be in the proportion of the fquare of the fine of the angle of incidence; and that its action on any fmall portion, fuch as a fquare foot of the fails or hull, is the fame as if that portion were detached from the reft, and were expofed, fingle and alone, to the wind or water in the fame angle. But we have fhown, in the article *Resistance of Fluids*, both from theory and experience, that both of thefe principles are erroneous, and this to a very great degree, in cafes which occur moft frequently in practice, that is, in the fmall angles of inclination. When the wind falls nearly perpendicular on the fails, theory is not very erroneous: but in thefe cafes, the circumftances of the fhip's fituation are generally fuch that the practice is eafy, occuring almoft without thought; and in this cafe, too, even confiderable deviations from the very beft practice are of no great moment. The interefting cafes, where the intended movement requires or depends upon very oblique actions of the wind on the fails, and its practicability or impracticability depends on a very fmall variation of this obliquity; a miftake of the force, either as to intenfity or direction, produces a mighty effect on the refulting motion. This is the cafe in failing to windward; the moft important of all the general problems of feamanfhip. The trim of the fails, and the courfe of the fhip, fo as to gain moft on the wind, are very nice things; that is, they are confined within very narrow limits, and a fmall miftake produces a very confiderable effect. The fame thing obtains in many of the nice problems of tacking, box-hauling, wearing after, lying-to in a ftorm, &c.

The error in the fecond affertion of the theory is ftill greater, and the action on one part of the fail or hull is fo greatly modified by its action on another adjoining part, that a ftay-fail is often feen hanging like a loofe rag, altho' there is nothing between it and the wind; and this merely becaufe a great fail in its neighbourhood fends off a lateral ftream of wind, which completely hinders the wind from getting at it. Till the theory of the action of fluids be eftablifhed, therefore, we cannot tell what are the forces which are acting on every point of the fail and hull: Therefore we cannot tell either the mean intenfity or direction of the whole force which acts on any particular fail, nor the intenfity and mean direction of the refiftance to the hull; circumftances abfolutely neceffary for enabling us to fay what will be their energy in producing a rotation round any particular axis. In like manner, we cannot, by fuch a computation, find the fpontaneous axis of converfion (fee Rotation), or the velocity of fuch converfion. In fhort, we cannot pronounce with tolerable confidence *à priori* what will be the motions in any cafe, or what difpofitions of the fails will produce the movement we wifh to perform. The experienced feaman learns by habit the general effects of every difpofition of the fails; and though his knowledge is far from being accurate, it feldom leads him into any very blundering operation. Perhaps he feldom makes the beft adjuftment poffible, but feldomer ftill does he deviate very far from it; and in the moft general and important problem, fuch as working to windward, the refult of much experience and many corrections has fettled a trim of the fails, which is certainly not far from the truth, but (it muft be acknowledged) deviates widely and uniformly from the theories of the mathematician's clofet. The honeft tar, therefore, muft be indulged in his joke on the ufelefs labours of the mathematician, who can neither hand, reef, nor fteer.

After this account of the theoretical performances in the art of feamanfhip, and what we have faid in another place on the fmall hopes we entertain of feeing a perfect theory of the impulfe of fluids, it will not be expected that we enter very minutely on the fubject in this place; nor is it our intention. But let it be obferved, that theory is defective in one point only; 7 though u[…] may be made of them.
and although this is a moft important point, and the errors in it deftroy the conclufions of the chief propofitions, the reafoning remains in full force, and the *modus operandi* is precifely fuch as is ftated in the theory. The *principles* of the art are therefore to be found in thefe treatifes; but falfe inferences have been drawn, by computing from erroneous quantities. The rules and the practice of the computation, however, are ftill beyond controverfy: Nay, fince the procefs of inveftigation is legitimate, we may make ufe of it in order to difcover the very circumftance in which we are at prefent miftaken; for by converting the propofition, inftead of finding the motions by means of the fuppofed forces, combined with the known mechanifm, we may difcover the forces by means of this mechanifm and the obferved motions.

We fhall therefore in this place give a very general view of the movements of a fhip under fail, fhowing how they are produced and modified by the action of the wind on her fails, the water on her rudder and on her bows. We fhall not attempt a precife determination of any of thefe movements; but we fhall fay enough to enable the curious landfman to underftand how this mighty machine is managed amidft the fury of the winds and waves; and, what is more to our wifh, we hope to enable the uninftructed but thinking feaman to generalize that knowledge which he poffeffes; to clafs his ideas and give them a fort of rational fyftem; and even to improve his practice, by making him fenfible of the immediate operation of every thing he does, and in what manner it contributes to produce the movement which he has in view. 8 Defign of this artic[le]

A fhip may be confidered at prefent as a mafs of inert matter in free fpace, at liberty to move in every direction, according to the forces which impel or refift her: and when fhe is in actual motion, in the direction of her courfe, we may ftill confider her as at reft in abfolute fpace, but expofed to the impulfe of a current of water moving equally faft in the oppofite direction; for in both cafes the preffure of the water on her bows, is the fame; and we know that it is poffible, and frequently happens in currents, that the impulfe of the wind on her fails, and that of the water on her bows, balance each other fo precifely, that fhe not only does not ftir from the place, but alfo remains fteadily in the fame pofition, with her head directed to the fame point of the compafs. This ftate of things is eafily conceived by any perfon accuftomed to confider mechanical fubjects, and every feaman of experience has obferved it. It is of importance to confider it in this point of view, becaufe it gives us the moft familiar notion of the manner in which thefe forces of the wind and water are fet in oppofition, and made to balance or not to balance each 9 A fhip co[n]fidered as [in] free fpace impelled and refift[ed] by oppofi[te] forces.

each other by the intervention of the ship, in the same manner as the goods and the weights balance each other in the scales by the intervention of a beam or steelyard.

10 Impulse of the wind on the sails opposite to that of the water on the bows.

When a ship proceeds steadily in her course, without changing her rate of sailing, or varying the direction of her head, we must in the first place conceive the accumulated impulses of the wind on all her sails as precisely equal and directly opposite to the impulse of the water on her bows. In the next place, because the ship does not change the direction of her keel, she resembles the balanced steelyard, in which the energies of the two weights, which tend to produce rotations in opposite directions, and thus to change the position of the beam, mutually balance each other round the fulcrum; so the energies of the actions of the wind on the different sails balance the energies of the water on the different parts of the hull.

The seaman has two principal tasks to perform. The first is to keep the ship steadily in that course which will bring her farthest on in the line of her intended voyage. This is frequently very different from that line, and the choice of the best course is sometimes a

11 Skill of the seaman displayed in shaping his course.

matter of considerable difficulty. It is sometimes possible to shape the course precisely along the line of the voyage; and yet the intelligent seaman knows that he will arrive sooner, or with greater safety, at his port, by taking a different course; because he will gain more by increasing his speed than he loses by increasing the distance. Some principle must direct him in the selection of this course. This we must attempt to lay before the reader.

Having chosen such a course as he thinks most advantageous, he must set such a quantity of sail as the strength of the wind will allow him to carry with safety and effect, and must trim the sails properly, or so adjust their positions to the direction of the wind, that they may have the greatest possible tendency to impel the ship in the line of her course, and to keep her steadily in that direction.

His other task is to produce any deviations which he sees proper from the present course of the ship; and to produce these in the most certain, the safest, and the most expeditious manner. It is chiefly in this movement that the mechanical nature of a ship comes into view, and it is here that the superior address and resource of an expert seaman is to be perceived.

Under the article Sailing some notice has been taken of the first task of the seaman, and it was there shown how a ship, after having taken up her anchor and fitted her sails, accelerates her motion, by degrees which continually diminish, till the increasing resistance of the water becomes precisely equal to the diminished impulse of the wind, and then the motion continues uniformly the same so long as the wind continues to blow with the same force and in the same direction.

It is perfectly consonant to experience that the impulse of fluids is in the duplicate ratio of the relative velocity. Let it be supposed that when water moves one foot per second its perpendicular pressure or impulse on a square foot is m pounds. Then, if it be moving with the velocity V estimated in feet per second, its perpendicular impulse on a surface S, containing any number of square feet, must be $m\,SV^2$.

In like manner, the impulse of air on the same surface may be represented by $n\,SV^2$; and the proportion of the impulse of these two fluids will be that of m to n. We may express this by the ratio of q to 1, making $\frac{m}{n} = q$.

M. Bouguer's computations and tables are on the supposition that the impulse of sea water moving one foot per second is 23 ounces on a square foot, and that the impulse of the wind is the same when it blows at the rate of 24 feet per second. These measures are all French. They by no means agree with the experiments of others; and what we have already said, when treating of the *Resistance of Fluids*, is enough to show us that nothing like precise measures can be expected. It was shown as the result of a rational investigation, and confirmed by the experiments of Buat and others, that the impulsions and resistances at the same surface, with the same obliquity of incidence and the same velocity of motion, are different according to the form and situation of the adjoining parts. Thus the total resistance of a thin board is greater than that of a long prism, having this board for its front or bow, &c. 12 Impulse of the water computed in ounces on the square foot.

We are greatly at a loss what to give as absolute measures of these impulsions.

1. With respect to water. The experiments of the French academy on a prism two feet broad and deep and four feet long, indicate a resistance of 0,973 pounds avoirdupois to a square foot, moving with the velocity of one foot per second at the surface of still water.

Mr Buat's experiments on a square foot wholly immersed in a stream were as follow:

A square foot as a thin plate -	1,81 pounds.
Ditto as the front of a box one foot long - - -	1,42
Ditto as the front of a box three feet long - - -	1,29

The resistance of sea water is about $\frac{1}{35}$ greater.

2. With respect to air, the varieties are as great.—The resistance of a square foot to air moving with the velocity of one foot per second appears from Mr Robins's experiments on 16 square inches to be on a square foot - - 0,001596 pounds,

Chevalier Borda's on 16 inches	0,001757
———— on 81 inches	0,002042
Mr Rouse's on large surfaces	0,002291

Precise measures are not to be expected, nor are they necessary in this inquiry. Here we are chiefly interested in their proportions, as they may be varied by their mode of action in the different circumstances of obliquity and velocity.

We begin by recurring to the fundamental proposition concerning the impulse of fluids, viz. that the absolute pressure is always in a direction perpendicular to the impelled surface, whatever may be the direction of the stream of fluid. We must therefore illustrate the doctrine, by always supposing a flat surface of sail stretched on a yard, which can be braced about in any direction, and giving this sail such a position and such an extent of surface that the impulse on it may be the same both as to direction and intensity with that on the real sails. Thus the consideration is greatly simplified. The direction of the impulse is therefore perpendicular to the yard. Its intensity depends on the velocity 13 Direct impulse on the sail perpendicular to the yard.

locity with which the wind meets the ſail, and the obliquity of its ſtroke. We ſhall adopt the conſtructions founded on the common doctrine, that the impulſe is as the ſquare of the ſine of the inclination, becauſe they are ſimple; whereas, if we are to introduce the values of the oblique impulſes, ſuch as they have been obſerved in the excellent experiments of the Academy of Paris, the conſtructions would be complicated in the extreme, and we could hardly draw any conſequences which would be intelligible to any but expert mathematicians. The concluſions will be erroneous, not in kind but in quantity only; and we ſhall point out the neceſſary corrections, ſo that the final reſults will be found not very different from real obſervation.

14 A ſhip compared to an oblong box.

If a ſhip were a round cylindrical body like a flat tub, floating on its bottom, and fitted with a maſt and ſail in the centre, ſhe would always ſail in a direction perpendicular to the yard. This is evident. But ſhe is an oblong body, and may be compared to a cheſt, whoſe length greatly exceeds its breadth. She is ſo ſhaped, that a moderate force will puſh her through the water with the head or ſtern foremoſt; but it requires a very great force to puſh her ſidewiſe with the ſame velocity. A fine ſailing ſhip of war will require about 12 times as much force to puſh her ſidewiſe as to puſh her head foremoſt. In this reſpect therefore ſhe will very much reſemble a cheſt whoſe length is 12 times its breadth; and whatever be the proportion of theſe reſiſtances in different ſhips, we may always ſubſtitute a box which ſhall have the ſame reſiſtances headwiſe and ſidewiſe.

Let EFGH (fig. 1.) be the horizontal ſection of ſuch a box, and AB its middle line, and C its centre. In whatever direction this box may chance to move, the direction of the whole reſiſtance on its two ſides will paſs through C. For as the whole ſtream has one inclination to the ſide EF, the equivalent of the equal impulſes on every part will be in a line perpendicular to the middle of EF. For the ſame reaſon, it will be in a line perpendicular to the middle of FG. Theſe perpendiculars muſt croſs in C. Suppoſe a maſt erected at C, and YCy to be a yard hoiſted on it carrying a ſail. Let the yard be firſt conceived as braced right athwart at right angles to the keel, as repreſented by Y′y′. Then, whatever be the direction of the wind abaft this ſail, it will impel the veſſel in the direction CB. But if the ſail has the oblique poſition Yy, the impulſe will be in the direction CD perpendicular to CY, and will both puſh the veſſel ahead and ſidewiſe: for the impulſe CD is equivalent to the two impulſes CK and CI (the ſides of the rectangle of which CD is the diagonal). The force CI puſhes the veſſel ahead, and CK puſhes her ſidewiſe. She muſt therefore take ſome intermediate direction $a\,b$, ſuch that the reſiſtance of the water to the plane FG is to its reſiſtance to the plane EF as CI to CK.

15 Of the leeway when not ſailing directly before the wind.

The angle bCB between the real courſe and the direction of the head is called the Leeway; and in the courſe of this diſſertation we ſhall expreſs it by the ſymbol x. It evidently depends on the ſhape of the veſſel and on the poſition of the yard. An accurate knowledge of the quantity of leeway, correſponding to different circumſtances of obliquity of impulſe, extent of ſurface, &c. is of the utmoſt importance in the practice of navigation; and even an approximation is valuable. The ſubject is ſo very difficult that this muſt content us for the preſent.

16 How to find the quantity of leeway.

Let V be the velocity of the ſhip in the direction Cb, and let the ſurfaces FG and FE be called A′ and B′. Then the reſiſtance to the lateral motion is $mV^2 \times B' \times$ ſine^2, bCB, and that to the direct motion is $mV^2 \times A' \times$ ſine^2, bCK, or $mV^2 \times A' \times$ coſ.$^2\,b$CB. Therefore theſe reſiſtances are in the proportion of B′ × ſine^2, x to A′ × coſ.^{2}, x (repreſenting the angle of leeway bCB by the ſymbol x).

Therefore we have CI : CK, or CI : ID = A′· coſ.$^2 x$: B′· ſine^2, x, $= A' : B' \cdot \frac{\text{ſine}^2 x}{\text{coſ.}^2 x} = A : B \cdot$ tangent$^2 x$.

Let the angle YCB, to which the yard is braced up, be called the Trim of the ſails, and expreſſed by the ſymbol b. This is the complement of the angle DCB. Now CI : ID = rad. : tan. DCI, = 1 : tan. DCI, = 1 : cotan. b. Therefore we have finally 1 : cotan. b = A′ : B′· tan.$^2 x$, and A′· cotan. b = B′· tangent$^2 x$, and tan.$^2 x = \frac{A}{B}$ cot. b. This equation evidently aſcertains the mutual relation between the trim of the ſails and the leeway in every caſe where we can tell the proportion between the reſiſtances to the direct and broadſide motions of the ſhip, and where this proportion does not change by the obliquity of the courſe. Thus, ſuppoſe the yard braced up to an angle of 30° with the keel. Then cotan. 30° = 1,732 very nearly. Suppoſe alſo that the reſiſtance ſidewiſe is 12 times greater than the reſiſtance headwiſe. This gives A′ = 1 and B′ = 12. Therefore 1,732 = 12 × tangent$^2 x$, and tangent$^2 x = \frac{1{,}732}{12}$, = 0,14434, and tan. x = 0,3799, and x = 20° 48′, very nearly two points of leeway.

This computation, or rather the equation which gives room for it, ſuppoſes the reſiſtances proportional to the ſquares of the ſines of incidence. The experiments of the Academy of Paris, of which an abſtract is given in the article *Resistance of Fluids*, ſhow that this ſuppoſition is not far from the truth when the angle of incidence is great. In this preſent caſe the angle of incidence on the front FG is about 70°, and the experiments juſt now mentioned ſhow that the real reſiſtances exceed the theoretical ones only $\frac{1}{17}$. But the angle of incidence on EF is only 20° 48′. Experiment ſhows that in this inclination the reſiſtance is almoſt quadruple of the theoretical reſiſtances. Therefore the lateral reſiſtance is aſſumed much too ſmall in the preſent inſtance. Therefore a much ſmaller leeway will ſuffice for producing a lateral reſiſtance which will balance the lateral impulſe CK, ariſing from the obliquity of the ſail, viz. 30°. The matter of fact is, that a pretty good ſailing ſhip, with her ſails braced to this angle at a medium, will not make above five or ſix degrees leeway in ſmooth water and eaſy weather; and yet in this ſituation the hull and rigging preſent a very great ſurface to the wind, in the moſt improper poſitions, ſo as to have a very great effect in increaſing her leeway. And if we compute the reſiſtances for this leeway of ſix degrees by the actual experiments of the French Academy on that angle, we ſhall find the reſult not far from

from the truth; that is, the direct and lateral resistances will be nearly in the proportion of CI to ID.

It results from this view of the matter, that the leeway is in general much smaller than what the usual theory assigns.

17 Which depends on the trim of the sails.

We also see, that according to whatever law the resistances change by a change of inclination, the leeway remains the same while the trim of the sails is the same. The leeway depends only on the direction of the impulse of the wind; and this depends solely on the position of the sails with respect to the keel, whatever may be the direction of the wind. This is a very important observation, and will be frequently referred to in the progress of the present investigation. Note, however, that we are here considering only the action on the sails, and on the same sails. We are not considering the action of the wind on the hull and rigging. This may be very considerable; and it is always in a lee direction, and augments the leeway; and its influence must be so much the more sensible as it bears a greater proportion to the impulse on the sails. A ship under courses, or close-reefed topsails and courses, must make more leeway than when under all her canvas trimmed to the same angle. But to introduce this additional cause of deviation here would render the investigation too complicated to be of any use.

18 ... by experiments

This doctrine will be considerably illustrated by attending to the manner in which a lighter is tracked along a canal, or swings to its anchor in a stream. The track rope is made fast to some staple or bolt E on the deck (fig. 2.), and is passed between two of the timberheads of the bow at D, and laid hold of at F on shore. The men or cattle walk along the path FG, the rope keeps extended in the direction DF, and the lighter arranges itself in an oblique position AB, and is thus dragged along in the direction $a\,b$, parallel to the side of the canal. Or, if the canal has a current in the opposite direction $b\,a$, the lighter may be kept steady in its place by the rope DF made fast to a post at F. In this case, it is always observed that the lighter swings in a position AB, which is oblique to the stream $a\,b$. Now the force which retains it in this position, and which precisely balances the action of the stream, is certainly exerted in the direction DF; and the lighter would be held in the same manner if the rope were made fast at C amidship, without any dependence on the timberheads at D; and it would still be held in the same position, if, instead of the single rope CF, it were riding by two ropes CG and GH, of which CH is in a direction right a-head, but oblique to the stream, and the other CG is perpendicular to CH or AB. And, drawing DI and DK perpendicular to AB and CG, the strain on the rope CH is to that on the rope CG as CI to CK. The action of the rope in these cases is precisely analogous to that of the sail $y\,Y$; and the obliquity of the keel to the direction of the motion, or to the direction of the stream, is analogous to the leeway. All this must be evident to any person accustomed to mechanical disquisitions.

19 ... models

A most important use may be made of this illustration. If an accurate model be made of a ship, and if it be placed in a stream of water, and ridden in this manner by a rope made fast at any point D of the bow, it will arrange itself in some determined position AB. There will be a certain obliquity to the stream, measured by the angle B$o\,b$; and there will be a corresponding obliquity of the rope, measured by the angle FCB. Let y CY be perpendicular to CF. Then CY will be the position of the yard, or trim of the sails corresponding to the leeway bCB. Then, if we shift the rope to a point of the bow distant from D by a small quantity, we shall obtain a new position of the ship, both with respect to the stream and the rope; and in this way may be obtained the relation between the position of the sails and the leeway, independent of all theory, and susceptible of great accuracy; and this may be done with a variety of models suited to the most usual forms of ships.

20 on ships.

In farther thinking on this subject, we are persuaded that these experiments, instead of being made on models, may with equal ease be made on a ship of any size. Let the ship ride in a stream at a mooring D (fig. 3.) by means of a short hawser BCD from her bow, having a spring AC on it carried out from her quarter. She will swing to her moorings, till she ranges herself in a certain position AB with respect to the direction $a\,b$ of the stream; and the direction of the hawser DC will point to some point E of the line of the keel. Now, it is plain to any person acquainted with mechanical disquisitions, that the deviation BEb is precisely the leeway that the ship will make when the average position of the sails is that of the line GEH perpendicular to ED; at least this will give the leeway which is produced by the sails alone. By heaving on the spring, the knot C may be brought into any other position we please; and for every new position of the knot the ship will take a new position with respect to the stream and to the hawser. And we persist in saying, that more information will be got by this train of experiments than from any mathematical theory: for all theories of the impulses of fluids must proceed on physical postulates with respect to the motions of the filaments, which are exceedingly conjectural.

21 The comparison of a ship to an oblong body is only useful to give clear notions on the subject.

And it must now be farther observed, that the substitution which we have made of an oblong parallelopiped for a ship, although well suited to give us clear notions of the subject, is of small use in practice; for it is next to impossible (even granting the theory of oblique impulsions) to make this substitution. A ship is of a form which is not reducible to equations; and therefore the action of the water on her bow or broadside can only be had by a most laborious and intricate calculation for almost every square foot of its surface. (See *Bezout's Cours de Mathem.* Vol. V. p. 72, &c.) And this must be different for every ship. But, which is more unlucky, when we have got a parallelopiped which will have the same proportion of direct and lateral resistance for a particular angle of leeway, it will not answer for another leeway of the same ship; for when the leeway changes, the figure actually exposed to the action of the water changes also. When the leeway is increased, more of the lee-quarter is acted on by the water, and a part of the weather-bow is now removed from its action. Another parallelopiped must therefore be discovered, whose resistances shall suit this new position of the keel with respect to the real course of the ship.

We therefore beg leave to recommend this train of experiments to the notice of the ASSOCIATION FOR THE IMPROVEMENT OF NAVAL ARCHITECTURE as a very promising method for ascertaining this important

point

point. And we proceed, in the next place, to ascertain the relation between the velocity of the ship and that of the wind, modified as they may be by the trim of the sails and the obliquity of the impulse.

22 The relation between the velocity of the ship and wind ascertained.

Let AB (fig. 4, 5, and 6.) represent the horizontal section of a ship. In place of all the drawing sails, that is, the sails which are ready filled, we can always substitute one sail of equal extent, trimmed to the same angle with the keel. This being supposed attached to the yard DCD, let this yard be first of all at right angles to the keel, as represented in fig. 4. Let the wind blow in the direction WC, and let CE (in the direction WC continued) represent the velocity V of the wind. Let CF be the velocity v of the ship. It must also be in the direction of the ship's motion, because when the sail is at right angles to the keel, the absolute impulse on the sail is in the direction of the keel, and there is no lateral impulse, and consequently no leeway. Draw EF, and complete the parallelogram CFEe, producing eC through the centre of the yard to w. Then wC will be the relative or apparent direction of the wind, and Ce or FE will be its apparent or relative velocity: For if the line Ce be carried along CF, keeping always parallel to its first position, and if a particle of air move uniformly along CE (a fixed line in absolute space) in the same time, this particle will always be found in that point of CE where it is intersected at that instant by the moving line Ce; so that if Ce were a tube, the particle of air, which really moves in the line CE, would always be found in the tube Ce. While CE is the real direction of the wind, Ce will be the position of the vane at the mast head, which will therefore mark the apparent direction of the wind, or its motion relative to the moving ship.

We may conceive this in another way. Suppose a cannon-shot fired in the direction CE at the passing ship, and that it passes through the mast at C with the velocity of the wind. It will not pass through the offside of the ship at P, in the line CE: for while the shot moves from C to P, the point P has gone forward, and the point p is now in the place where P was when the shot passed through the mast. The shot will therefore pass through the ship's side in the point p, and a person on board seeing it pass through C and p will say that its motion was in the line Cp.

23 When a ship is in motion the apparent direction of the wind is always ahead of its real direction.

Thus it happens, that when a ship is in motion the apparent direction of the wind is always ahead of its real direction. The line wC is always found within the angle WCB. It is easy to see from the construction, that the difference between the real and apparent directions of the wind is so much the more remarkable as the velocity of the ship is greater: For the angle WCw or ECe depends on the magnitude of Ee or CF, in proportion to CE. Persons not much accustomed to attend to these matters are apt to think all attention to this difference to be nothing but affectation of nicety. They have no notion that the velocity of a ship can have any sensible proportion to that of the wind. "Swift as the wind" is a proverbial expression; yet the velocity of a ship always bears a very sensible proportion to that of the wind, and even very frequently exceeds it. We may form a pretty exact notion of the velocity of the wind by observing the shadows of the summer clouds flying along the face of a country, and it may be very well measured by this method. The motion of such clouds cannot be very different from that of the air below; and when the pressure of the wind on a flat surface, while blowing with a velocity measured in this way, is compared with its pressure when its velocity is measured by more unexceptionable methods, they are found to agree with all desirable accuracy. Now observations of this kind frequently repeated, show that what we call a pleasant brisk gale blows at the rate of about 10 miles an hour, or about 15 feet in a second, and exerts a pressure of half a pound on a square foot. Mr Smeaton has frequently observed the sails of a windmill, driven by such a wind, moving faster, nay much faster, towards their extremities, so that the sail, instead of being pressed to the frames on the arms, was taken aback, and fluttering on them. Nay, we know that a good ship, with all her sails set and the wind on the beam, will in such a situation sail above 10 knots an hour in smooth water. There is an observation made by every experienced seaman, which shows this difference between the real and apparent directions of the wind very distinctly. When a ship that is sailing briskly with the wind on the beam tacks about, and then sails equally well on the other tack, the wind always appears to have shifted and come more ahead. This is familiar to all seamen. The seaman judges of the direction of the wind by the position of the ship's vanes. Suppose the ship sailing due west on the starboard tack, with the wind apparently, N. N. W. the vane pointing S. S. E. If the ship puts about, and stands due east on the larboard tack, the vane will be found no longer to point S. S. E. but perhaps S. S. W. the wind appearing N. N. E. and the ship must be nearly close-hauled in order to make an east course. The wind appears to have shifted four points. If the ship tacks again, the wind returns to its old quarter. We have often observed a greater difference than this. The celebrated astronomer Dr Bradley, taking the amusement of sailing in a pinnace on the river Thames, observed this, and was surprised at it, imagining that the change of wind was owing to the approaching to or retiring from the shore. The boatmen told him that it always happened at sea, and explained it to him in the best manner they were able. The explanation struck him, and set him a musing on an astronomical phenomenon which he had been puzzled by for some years, and which he called THE ABERRATION OF THE FIXED STARS. Every star changes its place a small matter for half a year, and returns to it at the completion of the year. He compared the stream of light from the star to the wind, and the telescope of the astronomer to the ship's vane, while the earth was like the ship, moving in opposite directions when in the opposite points of its orbit. The telescope must always be pointed ahead of the real direction of the star, in the same manner as the vane is always in a direction ahead of the wind; and thus he ascertained the progressive motion of light, and discovered the proportion of its velocity to the velocity of the earth in its orbit, by observing the deviation which was necessarily given to the telescope. Observing that the light shifted its direction about 40″, he concluded its velocity to be about 11,000 times greater than that of the earth; just as the intelligent seaman would conclude from this apparent shifting of the wind, that the velocity of the wind is about triple that of the ship. This is indeed the best method for

24 Observation of Dr Bradley on this subject.

for diſcovering the velocity of the wind. Let the direction of the vane at the maſt-head be very accurately marked on both tacks, and let the velocity of the ſhip be alſo accurately meaſured. The angle between the directions of the ſhip's head on theſe different tacks being halved, will give the real direction of the wind, which muſt be compared with the poſition of the vane in order to determine the angle contained between the real and apparent directions of the wind or the angle ECe; or half of the obſerved ſhifting of the wind will ſhow the inclination of its true and apparent directions. This being found, the proportion of EC to FC (fig. 6.) is eaſily meaſured.

We have been very particular on this point, becauſe ſince the mutual actions of bodies depend on their relative motions only, we ſhould make prodigious miſtakes if we eſtimated the action of the wind by its real direction and velocity, when they differ ſo much from the relative or apparent.

25 Velocity of ſhip when its ſails are at right angles to the keel.

We now reſume the inveſtigation of the velocity of the ſhip (fig. 4.), having its ſail at right angles to the keel, and the wind blowing in the direction and with the velocity CE, while the ſhip proceeds in the direction of the keel with the velocity CF. Produce Ee, which is parallel to BC, till it meet the yard in g, and draw FG perpendicular to Eg. Let a repreſent the angle WCD, contained between the ſail and the real direction of the wind, and let b be the angle of trim DCB. CE the velocity of the wind was expreſſed by V, and CF the velocity of the ſhip by v.

The abſolute impulſe on the ſail is (by the uſual theory) proportional to the ſquare of the relative velocity, and to the ſquare of the ſine of the angle of incidence; that is, to $FE^2 \times$ ſin.^{2} wCD. Now the angle GFE = wCD, and EG is equal to FE × ſin. GFE; and EG is equal to Eg—gG. But Eg = EC × ſin. ECg, = V × ſin. a; and gG = CF, = v. Therefore EG = V × ſin. a—v, and the impulſe is proportional to $\overline{V \times \text{ſin. } a - v}^2$. If S repreſent the ſurface of the ſail, the impulſe, in pounds, will be $n\,S\,(V \times \text{ſin. } a - v)^2$.

Let A be the ſurface which, when it meets the water perpendicularly with the velocity v, will ſuſtain the ſame preſſure or reſiſtance which the bows of the ſhip actually meets with. This impulſe, in pounds, will be $m\,A\,v^2$. Therefore, becauſe we are conſidering the ſhip's motion as in a ſtate of uniformity, the two preſſures balance each other; and therefore $m\,A\,v^2 = n\,S\,(V \times \text{ſin. } a - v)^2$, and $\frac{m}{n} A\,v^2 = S(V \times \text{ſin. } a - v^2)$;

therefore $\frac{\sqrt{m}}{n} \sqrt{A} \times v = \sqrt{S} \times V \times \text{ſin. } a - v\sqrt{S}$,

and $v = \frac{\sqrt{S} \times v \times \text{ſin. } a}{\sqrt{\frac{m}{n}A} + \sqrt{S}} = \frac{V \times \text{ſin. } a}{\sqrt{\frac{mA}{nS}} + 1} = \frac{V \times \text{ſin. } a}{\sqrt{\frac{A}{q\,S}} + 1}$.

We ſee, in the firſt place, that the velocity of the ſhip is (*cæteris paribus*) proportional to the velocity of the wind, and to the ſine of its incidence on the ſail jointly; for while the ſurface of the ſail S and the equivalent ſurface for the bows remains the ſame, v increaſes or diminiſhes at the ſame rate with V · ſin. a—. When the wind is right aſtern, the ſine of a is unity, and then the ſhip's velocity is $\frac{V}{\sqrt{\frac{m\,A}{n\,S}} + 1}$.

Note, that the denominator of this fraction is a common number; for m and n are numbers, and A and S being quantities of one kind, $\frac{A}{S}$ is alſo a number.

It muſt alſo be carefully attended to, that S expreſſes a quantity of ſail actually receiving wind with the inclination a. It will not always be true, therefore, that the velocity will increaſe as the wind is more abaft, becauſe ſome ſails will then becalm others. This obſervation is not, however, of great importance; for it is very unuſual to put a ſhip in the ſituation conſidered hitherto; that is, with the yards ſquare, unleſs ſhe be right before the wind.

If we would diſcover the relation between the velocity and the quantity of ſail in this ſimple caſe of the wind right aſt, obſerve that the equation $v = \frac{V}{\sqrt{\frac{mA}{nS}} + 1}$ gives us $\sqrt{\frac{m\,A}{n\,S}}\,v + v = V$, and $\sqrt{\frac{m\,A}{n\,S}}\,v = V - v$, and $\frac{m\,A}{n\,S} v^2 = \overline{V - v}^2$, and $\frac{n\,S}{m\,A} = \frac{v^2}{(V-v)^2}$; and becauſe n and m and A are conſtant quantities, S is proportional to $\frac{v^2}{(V-v)^2}$, or the ſurface of ſail is proportional to the ſquare of the ſhip's velocity directly, and to the ſquare of the relative velocity inverſely. Thus, if a ſhip be ſailing with $\frac{1}{3}$ of the velocity of the wind, and we would have her ſail with $\frac{1}{2}$ of it, we muſt quadruple the ſails. This is more eaſily ſeen in another way. The velocity of the ſhip is proportional to the velocity of the wind; and therefore the relative velocity is alſo proportional to that of the wind, and the impulſe of the wind is as the ſquare of the relative velocity. Therefore, in order to increaſe the relative velocity by an increaſe of ſail only, we muſt make this increaſe of ſail in the duplicate proportion of the increaſe of velocity.

Let us, in the next place, conſider the motion of a ſhip whoſe ſails ſtand oblique to the keel.

26 Its velocity when the ſails ſtand oblique to the keel.

The conſtruction for this purpoſe differs a little from the former, becauſe, when the ſails are trimmed to any oblique poſition DCB (fig. 5. and 6.), there muſt be a deviation from the direction of the keel, or a leeway BCb. Call this x. Let CF be the velocity of the ſhip. Draw, as before, Eg perpendicular to the yard, and FG perpendicular to Eg; alſo draw FH perpendicular to the yard: then, as before, EG, which is in the ſubduplicate ratio of the impulſe on the ſail, is equal to Eg—Gg. Now Eg is, as before, = V × ſin. a, and Gg is equal to FH, which is = CF × ſin. FCH, or = v × ſin. (b+x). Therefore we have the impulſe = $n\,S(V \cdot \text{ſin. } a - v \cdot \text{ſin. } (b+x))^2$.

This expreſſion of the impulſe is perfectly ſimilar to that in the former caſe, its only difference conſiſting in the ſubductive part, which is here $v \times \text{ſin. } \overline{b+x}$ inſtead of v. But it expreſſes the ſame thing as before, viz. the diminution of the impulſe. The impulſe being reckoned ſolely in the direction perpendicular to the ſail,

it is diminished solely by the sail withdrawing itself *in that direction* from the wind; and as g E may be considered as the real impulsive motion of the wind, G E must be considered as the relative and effective impulsive motion. The impulse would have been the same had the ship been at rest, and had the wind met it perpendicularly with the velocity G E.

27 Connection between the impulse and motion of the ship.

We must now shew the connexion between this impulse and the motion of the ship. The sail, and consequently the ship, is pressed by the wind in the direction CI perpendicular to the sail or yard with the force which we have just now determined. This (in the state of uniform motion) must be equal and opposite to the action of water. Draw I L at right angles to the keel. The impulse in the direction CI (which we may measure by CI) is equivalent to the impulses C L and LI. By the first the ship is impelled right forward, and by the second she is driven sidewise. Therefore we must have a leeway, and a lateral as well as a direct resistance. We suppose the form of the ship to be known, and therefore the proportion is known, or discoverable, between the direct and lateral resistances corresponding to every angle x of leeway. Let A be the surface whose perpendicular resistance is equal to the direct resistance of the ship corresponding to the leeway x, that is, whose resistance is equal to the resistance really felt by the ship's bows in the direction of the keel when she is sailing with this leeway; and let B in like manner be the surface whose perpendicular resistance is equal to the actual resistance to the ship's motion in the direction LI, perpendicular to the keel. (*N. B.* This is not equivalent to A′ and B′ adapted to the rectangular box, but to $A' \cdot \text{cos.}^2 x$ and $B' \cdot \text{sin.}^2 x$.) We have therefore A : B = CL : LI, and $LI = \frac{CL \cdot B}{A}$. Also, because $CI = \sqrt{CL^2 + LI^2}$, we have $A : \sqrt{A^2 + B^2} = CL : CI$, and $CI = \frac{CL \cdot \sqrt{A^2 + B^2}}{A}$. The resistance in the direction LC is properly measured by $m\,A\,v^2$, as has been already observed. Therefore the resistance in the direction I C must be expressed by $m \sqrt{A^2 + B^2}\, v^2$; or (making C the surface which is equal to $\sqrt{A^2 + B^2}$, and which will therefore have the same perpendicular resistance to the water having the velocity v) it may be expressed by $m\,C\,v^2$.

Therefore, because there is an equilibrium between the impulse and resistance, we have $m\,C v^2 = n\,S\,(V \cdot \text{sin.}\, a - v \cdot \text{sin.}\, \overline{b + x})^2$ and $\frac{m}{n} C v^2$, or $q\,C\,v^2 = S\,(V \cdot \text{sin.}\, a - v \cdot \text{sin.}\, \overline{b+x})^2$, and $\sqrt{q} \sqrt{C}\, v = \sqrt{S}\, (V \cdot \text{sin.}\, a - v \cdot \text{sin.}\, \overline{b + x})$.

Therefore $v = \frac{\sqrt{S} \cdot V \cdot \text{sin.}\, a}{\sqrt{q\,C} + \sqrt{S} \cdot \text{sin.}\, \overline{b + x}} = \frac{V \cdot \text{sin.}\, a}{\sqrt{q} \frac{\sqrt{C}}{\sqrt{S}} + \text{sin.}\, \overline{b + x}} = V \frac{\text{Sin.}\, a}{\sqrt{q} \frac{\sqrt{C}}{\sqrt{S}} + \text{sin.}\, \overline{b + x}}$.

Observe that the quantity which is the coefficient of V in this equation is a common number; for sin. a is a number, being a decimal fraction of the radius 1. Sin. $\overline{b + x}$ is also a number, for the same reason. And since m and n were numbers of pounds, $\frac{m}{n}$ or q is a common number. And because C and S are surfaces, or quantities of one kind, $\frac{C}{S}$ is also a common number.

This is the simplest expression that we can think of for the velocity acquired by the ship, though it must be acknowledged to be too complex to be of very prompt use. Its complication arises from the necessity of introducing the leeway x. This affects the whole of the denominator; for the surface C depends on it, because C = is $\sqrt{A^2 + B^2}$, and A and B are analogous to $A' \text{cos.}^2 x$ and $B' \text{sin.}^2 x$.

28 Important consequences deduced from the foregoing theorem.

But we can deduce some important consequences from this theorem.

1. While the surface S of the sail actually filled by the wind remains the same, and the angle DCB, which in future we shall call the Trim of the sails, also remains the same, both the leeway x and the substituted surface G remains the same. The denominator is therefore constant; and the velocity of the ship is proportional to $\sqrt{S} \cdot V \cdot \text{sin.}\, a$; that is, directly as the velocity of the wind, directly as the absolute inclination of the wind to the yard, and directly as the square root of the surface of the sails.

We also learn from the construction of the figure, that FG parallel to the yard cuts CE in a given ratio. For CF is in a constant ratio to E g, as has been just now demonstrated. And the angle DCF is constant. Therefore CF · sin. b, or FH or G g, is proportional to E g, and OC to EC, or EC is cut in one proportion, whatever may be the angle ECD, so long as the angle DCF is constant.

We also see that it is very possible for the velocity of the ship on an oblique course to exceed that of the wind. This will be the case when the number $\frac{\text{sin.}\, a}{\sqrt{q \frac{C}{S}} + \text{sin.}\, \overline{b + x}}$ exceeds unity, or when sin. a is greater than $\sqrt{q \frac{C}{S}} + \text{sin.}\, \overline{b + x}$. Now this may easily be by sufficiently enlarging S and diminishing $b + x$. It is indeed frequently seen in fine sailers with all their sails set and not hauled too near the wind.

We remarked above that the angle of leeway x affects the whole denominator of the fraction which expresses the velocity. Let it be observed that the angle ICL is the complement of LCD, or of b. Therefore CL : LI, or A : B = 1 : tan. ICL, = 1 : cot. b, and B = A · cotan. b. Now A is equivalent to $A' \cdot \text{cos.}^2 x$, and thus b becomes a function of x. C is evidently so, being $= \sqrt{A^2 + B^2}$. Therefore before the value of this fraction can be obtained, we must be able to compute, by our knowledge of the form of the ship, the value of A for every angle x of leeway. This can be done only by resolving her bows into a great number of elementary planes, and computing the impulse on each and adding them into one sum. The computation is of immense labour, as may be seen by one example given by Bouguer. When the leeway is but small, not exceeding ten degrees, the substitution of the rectangular prism of one determined form is abundantly exact for all leeways contained within this limit; and we shall soon see the rea-

son

fuft for being contented with this approximation. We may now make ufe of the formula expreffing the velocity for folving the chief problems in this part of the feaman's tafk.

29 [Problem I. To determine the beft pofition of the fails for ftanding on a given courfe, when the direction and velocity of the wind, and angle with the courfe are given.]

And firft let it be required to determine the beft pofition of the fail for ftanding on a given courfe *a b*, when CE the direction and velocity of the wind, and its angle with the courfe WCF, are given. This problem has exercifed the talents of the mathematicians ever fince the days of Newton. In the article PNEUMATICS we gave the folution of one very nearly related to it, namely, to determine the pofition of the fail which would produce the greateft impulfe in the direction of the courfe. The folution was to place the yard CD in fuch a pofition that the tangent of the angle FCD may be one half of the tangent of the angle DCW. This will indeed be the beft pofition of the fail for beginning the motion; but as foon as the fhip begins to move in the direction CF, the effective impulfe of the wind is diminifhed, and alfo its inclination to the fail. The angle DC*w* diminifhes continually as the fhip accelerates; for CF is now accompanied by its equal E*e*, and by an angle EC*e* or WC*w*. CF increafes, and the impulfe on the fail diminifhes, till an equilibrium obtains between the refiftance of the water and the impulfe of the wind. The impulfe is now meafured by $\Theta e^2 \times$ fin.^{2} eCD inftead of CE^2 $\times$ fin.^{2} ECD, that is, by EG^2 inftead of Eg^2.

This introduction of the relative motion of the wind renders the actual folution of the problem extremely difficult. It is very eafily expreffed geometrically: Divide the angle *w*CF in fuch a manner that the tangent of DCF may be half of the tangent of DC*w*, and the problem may be conftructed geometrically as follows.

Let WCF (fig. 7.) be the angle between the fail and courfe. Round the centre C defcribe the circle WDFY; produce WC to Q, fo that CQ$=\frac{1}{3}$ WC, and draw QY parallel to CF cutting the circle in Y; bifect the arch WY in D, and draw DC. DC is the proper pofition of the yard.

Draw the chord WY, cutting CD in V and CF in T; draw the tangent PD cutting CF in S and CY in R.

It is evident that WY, PR, are both perpendicular to CD, and are bifected in V and D; therefore (by reafon of the parallels QY, CF) 4 : 3 = QW : CW, = YW : TW, = RP : SP. Therefore PD : PS = 2 : 3, and PD : DS = 2 : 1. Q. E. D. But this divifion cannot be made to the beft advantage till the fhip has attained its greateft velocity, and the angle *w*CF has been produced.

We muft confider all the three angles, *a*, *b*, and *x* as variable in the equation which expreffes the value of *v*, and we muft make the fluxion of this equation $= 0$; then, by means of the equation B $=$ A $\cdot$ cotan. *b*, we muft obtain the value of $\dot{b}$ and of b in terms of *x* and $\dot{x}$. With refpect to $\dot{a}$, obferve, that if we make the angle WCF $= p$, we have $p = a + b + x$; and p being a conftant quantity, we have $\dot{a} + \dot{b} + \dot{x} = 0$. Subftituting for $\dot{a}$, $\dot{b}$, *a*, and *b* their values in terms of *x* and $\dot{x}$, in the fluxionary equation $= 0$, we readily obtain *x*, and then *a* and *b*, which folves the problem.

Let it be required, in the next place, to determine the courfe and the trim of the fails moft proper for plying to windward.

30 [Problem II. To determine the courfe and trim of the fails moft proper for plying to windward.]

In fig. 6. draw FP perpendicular to WC. CF is the motion of the fhip; but it is only by the motion CP that fhe gains to windward. Now CP is $=$ CF $\times$ cofin. WCF, or $v \cdot$ cofin. $(a+b+x)$. This muft be rendered a maximum, as follows:

By means of the equation which expreffes the value of *u* and the equation B $=$ A $\cdot$ cotan. *b*, we exterminate the quantities *u* and *b*; we then take the fluxion of the quantity into which the expreffion $v \cdot$ cof. $(a+b+x)$ is changed by this operation. Making this fluxion $=0$, we get the equation which muft folve the problem. This equation will contain the two variable quantities *a* and *x* with their fluxions; then make the coefficient of $\dot{x}$ equal to o, alfo the coefficient of $\dot{a}$ equal to o. This will give two equations which will determine *a* and *x*, and from this we get $b = p - a - x$.

31 [Problem III. To determine the beft courfe and trim of the fails for getting away from a given line of coaft.]

Should it be required, in the third place, to find the beft courfe and trim of the fails for getting away from a given line of coaft CM (fig. 6.), the procefs perfectly refembles this laft, which is in fact getting away from a line of coaft which makes a right angle with the wind. Therefore, in place of the angle WCF, we muft fubftitute the angle WCM $=\pm$ WCF. Call this angle *e*. We muft make $v \cdot$ cof. $(e \pm a \pm b \pm x)$ a maximum. The analytical procefs is the fame as the former, only *e* is here a conftant quantity.

32 [Obfervations on the preceding problems.]

Thefe are the three principal problems which can be folved by means of the knowledge that we have obtained of the motion of the fhip when impelled by an oblique fail, and therefore making leeway; and they may be confidered as an abftract of this part of M. Bouguer's work. We have only pointed out the procefs for this folution, and have even omitted fome things taken notice of by M. Bezout in this very elegant compendium. Our reafons will appear as we go on. The learned reader will readily fee the extreme difficulty of the fubject, and the immenfe calculations which are neceffary even in the fimpleft cafes, and will grant that it is out of the power of any but an expert analyft to derive any ufe from them; but the mathematician can calculate tables for the ufe of the practical feaman. Thus he can calculate the beft pofition of the fails for advancing in a courfe 90° from the wind, and the velocity in that courfe; then for 85°, 80°, 75°, &c. M. Bouguer has given a table of this kind; but to avoid the immenfe difficulty of the procefs, he has adapted it to the apparent direction of the wind. We have inferted a few of his numbers fuited to fuch cafes as can be of fervice, namely, when all the fails draw, or none ftand in the way of others. Column 1ft is the apparent angle of the wind and courfe; column 2d is the correfponding angle of the fails and keel; and column 3d is the apparent angle of the fails and wind.

33 [M. Bouguer's table for finding the beft pofition of the fails for advancing in any courfe.]

1 *w*CF	2 DCB	3 *w*CD
103° 53′	42° 30′	61° 23′
99 13	40 —	59 13
94 25	37 30	56 55

73 39	27 30	46 09
68 —	25 —	43 —

In

In all these numbers we have the tangent of wCD double of the tangent of DCF.

34 Inutility of these calculations.

But this is really doing but little for the seaman. The apparent direction of the wind is unknown to him till the ship is sailing with uniform velocity; and he is still uninformed as to the leeway. It is, however, of service to him to know, for instance, that when the angle of the vanes and yards is 56 degrees, the yard should be braced up to 37° 30′, &c.

But here occurs a new difficulty. By the construction of a square rigged ship it is impossible to give the yards that inclination to the keel which the calculation requires. Few ships can have their yards braced up to 37° 30′; and yet this is required in order to have an incidence of 56°, and to hold a course 94° 25′ from the apparent direction of the wind, that is, with the wind apparently 4° 25′ abaft the beam. A good sailing ship in this position may acquire a velocity even exceeding that of the wind. Let us suppose it only one half of this velocity. We shall find that the angle WCw is in this case about 29°, and the ship is nearly going 123° from the wind, with the wind almost perpendicular to the sail; therefore this utmost bracing up of the sails is only giving them the position suited to a wind broad on the quarter. It is impossible therefore to comply with the demand of the mathematician, and the seaman must be contented to employ a less favourable disposition of his sails in all cases where his course does not lie at least eleven points from the wind.

Let us see whether this restriction, arising from necessity, leaves any thing in our choice, and makes one course preferable to another. We see that there are a prodigious number of courses, and these the most usual and the most important, which we must hold with one trim of the sails; in particular, sailing with the wind on the beam, and all cases of plying to windward, must be performed with this unfavourable trim of the sails. We are certain that the smaller we make the angle of incidence, real or apparent, the smaller will be the velocity of the ship; but it may happen that we shall gain more to windward, or get sooner away from a lee coast, or any object of danger, by sailing slowly on one course than by sailing quickly on another.

We have seen that while the trim of the sails remains the same, the leeway and the angle of the yard and course remains the same, and that the velocity of the ship is as the sine of the angle of real incidence, that is, as the sine of the angle of the sail and the real direction of the wind.

Let the ship AB (fig. 8.) hold the course CF, with the wind blowing in the direction WC, and having her yards DCD braced up to the smallest angle BCD which the rigging can admit. Let CF be to CE as the velocity of the ship to the velocity of the wind; join FE and draw Cw parallel to EF; it is evident that FE is the relative motion of the wind, and wCD is the relative incidence on the sail. Draw FO parallel to the yard DC, and describe a circle through the points COF; then we say that if the ship, with the same wind and the same trim of the same drawing sails, be made to sail on any other course Cf, her velocity along CF is to the velocity along Cf as CF is to Cf; or, in other words, the ship will employ the same time in going from C to any point of the circumference CFO.

Join fO. Then, because the angles CFO, CfO are on the same chord CO, they are equal, and fO is parallel to dCd, the new position of the yard corresponding to the new position of the keel $a\,b$, making the angle dCb = DCB. Also, by the nature of the circle, the line CF is to Cf as the sine of the angle COF to the sine of the angle COf, that is (on account of the parallels CD, OF and Cd, Of), as the sine of WCD to the sine of WCd. But when the trim of the sails remains the same, the velocity of the ship is as the sine of the angle of the sail with the direction of the wind; therefore CF is to Cf as the velocity on CF to that on Cf, and the proposition is demonstrated.

Let it now be required to determine the best course for avoiding a rock R lying in the direction CR, or for withdrawing as fast as possible from a line of coast PQ. Draw CM through R, or parallel to PQ, and let m be the middle of the arch CmM. It is plain that m is the most remote from CM of any point of the arch CmM, and therefore the ship will recede farther from the coast PQ in any given time by holding the course Cm than by any other course. 35 To determine the best course for avoiding a rock.

This course is easily determined; for the arch CmM = 360° — (arch CO + arch OM), and the arch CO is the measure of twice the angle CFO, or twice the angle DCB, or twice $\overline{b+x}$, and the arch OM measures twice the angle ECM.

Thus, suppose the sharpest possible trim of the sails to be 35°, and the observed angle ECM to be 70°; then CO+OM is 70°+140° or 210°. This being taken from 360°, leaves 150°, of which the half Mm is 75°, and the angle MCm is 37° 30′. This added to ECM makes ECm 107° 30′, leaving WCm = 72° 30′, and the ship must hold a course making an angle of 72° 30′ with the real direction of the wind, and WCD will be 37° 30′.

This supposes no leeway. But if we know that under all the sail which the ship can carry with safety and advantage she makes 5 degrees of leeway, the angle DCm of the sail and course, or $b+x$, is 40°. Then CO+OM = 220°, which being taken from 360° leaves 140°, of which the half is 70°, = Mm, and the angle MCm = 35°, and ECm = 105°, and WCm = 75°, and the ship must lie with her head 70° from the wind, making 5 degrees of leeway, and the angle WCD is 35°.

The general rule for the position of the ship is, *that the line on shipboard which bisects the angle* b + x *may also bisect the angle* WCM, or make the angle between the course and the line from which we wish to withdraw equal to the angle between the sail and the real direction of the wind.

36 Corollary.

It is plain that this problem includes that of plying to windward. We have only to suppose ECM to be 90°; then, taking our example in the same ship, with the same trim and the same leeway, we have $b + x = 40°$. This taken from 90° leaves 50° and WCn=90—25=65, and the ship's head must lie 60° from the wind, and the yard must be 25° from it.

It must be observed here, that it is not always eligible to select the course which will remove the ship fastest from the given line CM; it may be more prudent to remove from it more securely though more slowly. In such cases the procedure is very simple, viz. to shape the course as near the wind as is possible.

The reader will also easily see that the propriety of these practices is confined to those courses only where the practicable trim of the sails is not sufficiently sharp. Whenever

Whenever the course lies so far from the wind that it is possible to make the tangent of the apparent angle of the wind and sail double the tangent of the sail and course, it should be done.

37
...e adjustment of the ...s suppo...d in the ...ory im...acticable.

These are the chief practical consequences which can be deduced from the theory. But we should consider how far this adjustment of the sails and course can be performed. And here occur difficulties so great as to make it almost impracticable. We have always supposed the position of the surface of the sail to be distinctly observable and measurable; but this can hardly be affirmed even with respect to a sail stretched on a yard. Here we supposed the surface of the sail to have the same inclination to the keel that the yard has. This is by no means the case; the sail assumes a concave form, of which it is almost impossible to assign the direction of the mean impulse. We believe that this is always considerably to leeward of a perpendicular to the yard, lying between CI and CE (fig. 6.) This is of some advantage, being equivalent to a sharper trim. We cannot affirm this, however, with any confidence, because it renders the impulse on the weather-leech of the sail so exceedingly feeble as hardly to have any effect. In sailing close to the wind the ship is kept so near that the weather-leech of the sail is almost ready to receive the wind edgewise, and to flutter or shiver. The most effective or drawing sails with a side wind, especially when plying to windward, are the staysails. We believe that it is impossible to say, with any thing approaching to precision, what is the position of the general surface of a staysail, or to calculate the intensity and direction of the general impulse; and we affirm with confidence that no man can pronounce on these points with any exactness. If we can guess within a third or a fourth part of the truth, it is all we can pretend to; and after all, it is but a guess. Add to this, the sails coming in the way of each other, and either becalming them or sending the wind upon them in a direction widely different from that of its free motion. All these points we think beyond our power of calculation, and therefore that it is in vain to give the seaman mathematical rules, or even tables of adjustment ready calculated; since he can neither produce that medium position of his sails that is required, nor tell what is the position which he employs.

This is one of the principal reasons why so little advantage has been derived from the very ingenious and promising disquisitions of Bouguer and other mathematicians, and has made us omit the actual solution of the chief problems, contenting ourselves with pointing out the process to such readers as have a relish for these analytical operations.

38
...e theory ...lf erroneous,

But there is another principal reason for the small progress which has been made in the theory of seamanship: This is the error of the theory itself, which supposes the impulsions of a fluid to be in the duplicate ratio of the sine of incidence. The most careful comparison which has been made between the results of this theory and matters of fact is to be seen in the experiments made by the members of the Royal Academy of Sciences at Paris, mentioned in the article *Resistance of Fluids*. We subjoin another abstract of them in the following table; where col. 1st gives the angle of incidence: col. 2d gives the impulsions really observed; col. 3d the impulses, had they followed the duplicate ratio of the sines; and col. 4th the impulses, if they were in the simple ratio of the sines:—

Angle of Incid.	Impulsion observed.	Impulse as Sine².	Impulse as Sine.
90	1000	1000	1000
84	989	989	995
78	958	957	978
72	908	905	951
66	845	835	914
60	771	750	866
54	693	655	809
48	615	552	743
42	543	448	669
36	480	346	587
30	440	250	500
24	424	165	407
18	414	96	309
12	406	43	208
6	400	11	105

Here we see an enormous difference in the great obliquities. When the angle of incidence is only six degrees, the observed impulse is forty times greater than the theoretical impulse; at 12° it is ten times greater; at 18° it is more than four times greater; and at 24° it is almost three times greater.

No wonder then that the deductions from this theory are so useless and so unlike what we familiarly observe. We took notice of this when we were considering the leeway of a rectangular box, and thus saw a reason for admitting an incomparably smaller leeway than what would result from the laborious computations necessary by the theory. This error in theory has as great an influence on the impulsions of air when acting obliquely on a sail; and the experiments of Mr Robins and of the chevalier Borda on the oblique impulsions of air are perfectly conformable (as far as they go) to those of the academicians on water. The oblique impulsions of the wind are therefore much more efficacious for pressing the ship in the direction of her course than the theory allows us to suppose; and the progress of a ship plying to windward is much greater, both because the oblique impulses of the wind are more effective, and because the leeway is much smaller, than we suppose. Were not this the case, it would be impossible for a square-rigged ship to get to windward. The impulse on her sails when close hauled would be so trifling that she would not have a third part of the velocity which we see her acquire: and this trifling velocity would be wasted in leeway; for we have seen that the diminution of the oblique impulses of the water is accompanied by an increase of leeway. But we see that in the great obliquities the impulsions continue to be very considerable, and that even an incidence of six degrees gives an impulse as great as the theory allows to an incidence of 40. We may therefore, on all occasions, keep the yards more square; and the loss which we sustain by the diminution of the very oblique impulse will be more than compensated by its more favourable direction with respect to the ship's keel. Let us take an example of this: Suppose the wind about two points before the beam, making an angle of 68° with the keel. The theory assigns 43° for the inclination of the wind to the

39
and the deductions from it useless.

the sail, and 25° from the trim of the sail. The perpendicular impulse being supposed 1000, the theoretical impulse for 43° is 465. This reduced in the proportion of radius to the sine of 25°, gives the impulse in the direction of the course only 197.

But if we ease off the lee braces till the yard makes an angle of 50° with the keel, and allows the wind an incidence of no more than 18°, we have the experimented impulse 414, which, when reduced in the proportion of radius to the sine of 50°, gives an effective impulse 317. In like manner, the trim 56°, with the incidence 12°, gives an effective impulse 337; and the trim 62°, with the incidence only 6°, gives 353.

Hence it would at first sight appear that the angle DCB of 62° and WCD of 6° would be better for holding a course within six points of the wind than any more oblique position of the sails; but it will only give a greater initial impulse. As the ship accelerates, the wind apparently comes ahead, and we must continue to brace up as the ship freshens her way. It is not unusual for her to acquire half or two thirds of the velocity of the wind; in which case the wind comes apparently ahead more than two points, when the yards must be braced up to 35°, and this allows an impulse no greater than about 7°. Now this is very frequently observed in good ships, which in a brisk gale and smooth water will go five or six knots close-hauled, the ship's head six points from the wind, and the sails no more than just full, but ready to shiver by the smallest luff. All this would be impossible by the usual theory; and in this respect these experiments of the French academy give a fine illustration of the seaman's practice. They account for what we should otherwise be much puzzled to explain; and the great progress which is made by a ship close-hauled being perfectly agreeable to what we should expect from the law of oblique impulsion deducible from these so often mentioned experiments, while it is totally incompatible with the common theory, should make us abandon the theory without hesitation, and strenuously set about the establishment of another, founded entirely on experiments. For this purpose the experiments should be made on the oblique impulsions of air on as great a scale as possible, and in as great a variety of circumstances, so as to furnish a series of impulsions for all angles of obliquity. We have but four or five experiments on this subject, viz. two by Mr Robins and two or three by the chevalier Borda. Having thus gotten a series of impulsions, it is very practicable to raise on this foundation a practical institute, and to give a table of the velocities of a ship suited to every angle of inclination and of trim; for nothing is more certain than the resolution of the impulse perpendicular to the sail into a force in the direction of the keel, and a lateral force.

40 Experiments proper for establishing another.

We are also disposed to think that experiments might be made on a model very nicely rigged with sails, and trimmed in every different degree, which would point out the mean direction of the impulse on the sails, and the comparative force of these impulses in different directions of the wind. The method would be very similar to that for examining the impulse of the water on the hull. If this can also be ascertained experimentally, the intelligent reader will easily see that the whole motion of a ship under sail may be determined for every case. Tables may then be constructed by calculation, or by graphical operations, which will give the velocities of a ship in every different course, and corresponding to every trim of sail. And let it be here observed, that the trim of the sail is not to be estimated in degrees of inclination of the yards; because, as we have already remarked, we cannot observe nor adjust the lateen sails in this way. But, in making the experiments for ascertaining the impulse, the exact position of the tacks and sheets of the sails are to be noted; and this combination of adjustments is to pass by the name of a certain trim. Thus that trim of all the sails may be called 40, whose direction is experimentally found equivalent to a flat surface trimmed to the obliquity 40°.

Having done this, we may construct a figure for each trim similar to fig. 8. where, instead of a circle, we shall have a curve COM'F', whose chords CF', cf', &c. are proportional to the velocities in these courses; and by means of this curve we can find the point m', which is most remote from any line CM from which we wish to withdraw; and thus we may solve all the principal problems of the art.

We hope that it will not be accounted presumption in us to expect more improvement from a theory founded on judicious experiments only, than from a theory of the impulse of fluids, which is found so inconsistent with observation, and of whose fallacy all its authors, from Newton to D'Alembert, entertained strong suspicions. Again, we beg leave to recommend this view of the subject to the attention of the SOCIETY FOR THE IMPROVEMENT OF NAVAL ARCHITECTURE. Should these patriotic gentlemen entertain a favourable opinion of the plan, and honour us with their correspondence, we will cheerfully impart to them our notions of the way in which both these trains of experiments may be prosecuted with success, and results obtained in which we may confide; and we content ourselves at present with offering to the public these hints, which are not the speculations of a man of mere science, but of one who, with a competent knowledge of the laws of mechanical nature, has the experience of several years service in the royal navy, where the art of working of ships was a favourite object of his scientific attention.

41 Recommended to the Society for the Improvement of Naval Architecture.

With these observations we conclude our discussion of the first part of the seaman's task, and now proceed to consider the means that are employed to prevent or to produce any deviations from the uniform rectilineal course which has been selected.

42 Means employed to prevent or produce deviations from a course.

Here the ship is to be considered as a body in free space, convertible round her centre of inertia. For whatever may be the point round which she turns, this motion may always be considered as compounded of a rotation round an axis passing through her centre of gravity or inertia. She is impelled by the wind and by the water acting on many surfaces differently inclined to each other, and the impulse on each is perpendicular to the surface. In order therefore that she may continue steadily in one course, it is not only necessary that the impelling forces, estimated in their mean direction, be equal and opposite to the resisting forces estimated in their mean direction; but also that these two directions may pass through one point, otherwise she will be affected as a log of wood is when pushed in opposite directions by two forces, which are equal indeed, but are applied to different parts of the log. A ship must be

be considered as a lever, acted on in different parts by forces in different directions, and the whole balancing each other round that point or axis where the equivalent of all the resisting forces passes. This may be considered as a point supported by this resisting force, and as a sort of fulcrum: therefore, in order that the ship may maintain her position, the energies or *momenta* of all the impelling forces round this point must balance each other.

43 npulses ... a ship ... iling right ... fore the ... ind diffe- ... nt from ... ose on ... r when ... iling ob- ... iquely.

When a ship sails right afore the wind, with her yards square, it is evident that the impulses on each side of the keel are equal, as also their mechanical *momenta* round any axis passing perpendicularly through the keel. So are the actions of the water on her bows. But when she sails on an oblique course, with her yards braced up on either side, she sustains a pressure in the direction CI (fig. 5.) perpendicular to the sail. This, by giving her a lateral pressure LI, as well as a pressure CL ahead, causes her to make leeway, and to move in a line C *b* inclined to CB. By this means the balance of action on the two bows is destroyed; the general impulse on the lee-bow is increased; and that on the weather bow is diminished. The combined impulse is therefore no longer in the direction BC, but (in the state of uniform motion) in the direction IC.

Suppose that in an instant the whole sails are annihilated and the impelling pressure CI, which precisely balanced the resisting pressure on the bows, removed. The ship tends, by her inertia, to proceed in the direction C *b*. This tendency produces a continuation of the resistance in the opposite direction IC, which is not directly opposed to the tendency of the ship in the direction C *b*; therefore the ship's head would immediately come up to the wind. The experienced seaman will recollect something like this when the sails are suddenly lowered when coming to anchor. It does not happen solely from the obliquity of the action on the bows: It would happen to the parallelopiped of fig. 2. which was sustaining a lateral impulsion B· sin.² *x*, and a direct impulsion A· cos.² *x*. These are continued for a moment after the annihilation of the sail; but being no longer opposed by a force in the direction CD, but by a force in the direction C *b*, the force B. sin.² *x* must prevail, and the body is not only retarded in its motion, but its head turns towards the wind. But this effect of the leeway is greatly increased by the curved form of the ship's bows. This occasions the centre of effort of all the impulsions of the water on the lee side of the ship to be very far forward, and this so much the more remarkably as she is sharper afore. It is in general not much abaft the foremast. Now the centre of the ship's tendency to continue her motion is the same with her centre of gravity, and this is generally but a little before the mainmast. She is therefore in the same condition nearly as if she were pushed at the mainmast in a direction parallel to C *b*, and at the foremast by a force parallel to IC. The evident consequence of this is a tendency to come up to the wind. This is independent of all situation of the sails, provided only that they have been trimmed obliquely.

44 riping.

This tendency of the ship's head to windward is called GRIPING in the seaman's language, and is greatest in ships which are sharp forward, as we have said already. This circumstance is easily understood. Whatever is the direction of the ship's motion, the absolute impulse on that part of the bow immediately contiguous to B is perpendicular to that very part of the surface. The more acute, therefore, that the angle of the bow is, the more will the impulse on that part be perpendicular to the keel, and the greater will be its energy to turn the head to windward.

45 Propriety of the disposition of the sails of a ship.

Thus we are enabled to understand or to see the propriety of the disposition of the sails of a ship. We see her crowded with sails forward, and even many sails extended far before her bow, such as the spritsail, the bowsprit-topsail, the fore-topmast staysail, the jib, and flying jib. The sails abaft are comparatively smaller. The sails on the mizenmast are much smaller than those on the foremast. All the staysails hoisted on the mainmast may be considered as headsails, because their centres of effort are considerably before the centre of gravity of the ship; and notwithstanding this disposition, it generally requires a small action of the rudder to counteract the windward tendency of the lee-bow. This is considered as a good quality when moderate; because it enables the seaman to throw the sails aback, and stop the ship's way in a moment, if she be in danger from any thing ahead; and the ship which does not carry a little of a weather helm, is always a dull sailer.

46 Action of the water and the sails.

In order to judge somewhat more accurately of the action of the water and sails, suppose the ship AB (fig. 9.) to have its sails on the mizenmast D, the mainmast E, and foremast F, braced up or trimmed alike, and that the three lines D *i*, E *e*, F *f*, perpendicular to the sails, are in the proportion of the impulses on the sails. The ship is driven ahead and to leeward, and moves in the path *a* C *b*. This path is so inclined to the line of the keel that the medium direction of the resistance of the water is parallel to the direction of the impulse. A line CI may be drawn parallel to the lines D *i*, E *e*, F *f*, and equal to their sum; and it may be drawn from such a point C, that the actions on all the parts of the hull between C and B may balance the *momenta* of all the actions on the hull between C and A.

47 Centre of effort

This point may justly be called the *centre of effort*, or the *centre of resistance*. We cannot determine this point for want of a proper theory of the resistance of fluids. Nay, although experiments like those of the Parisian academy should give us the most perfect knowledge of the intensity of the oblique impulses on a square foot, we should hardly be benefited by them: for the action of the water on a square foot of the hull at *p*, for instance, is so modified by the intervention of the stream of water which has struck the hull about B, and glided along the bow B *o p*, that the pressure on *p* is totally different from what it would have been were it a square foot of surface detached from the rest, and presented in the same position to the water moving in the direction *b* C. For it is found, that the resistances given to planes joined so as to form a wedge, or to curved surfaces, are widely different from the accumulated resistances, calculated for their separate parts, agreeably to the experiments of the academy on single surfaces. We therefore do not attempt to ascertain the point C by theory; but it may be accurately determined by the experiments which we have so strongly recommended; and we offer this as an additionl inducement for prosecuting them.

48 to be determined by experiments.

Draw through C a line perpendicular to CI, that is, parallel to the sails; and let the lines of impulse of the three

three

three sails cut it in the points i, k, and m. This line im may be considered as a lever, moveable round C, and acted on at the points i, k, and m, by three forces. The rotatory momentum of the sails on the mizenmast is $\mathrm{D}i \times i\mathrm{C}$; that of the sails on the mainmast is $\mathrm{E}e \times k\mathrm{C}$; and the momentum of the sails on the foremast is $\mathrm{F}f \times m\mathrm{C}$.

49 Equilibrium preserved by the position of the sails.

The two first tend to press forward the arm C i, and then to turn the ship's head towards the wind. The action of the sails on the foremast tends to pull the arm C m forward, and produce a contrary rotation. If the ship under these three sails keeps steadily in her course, without the aid of the rudder, we must have $\mathrm{D}i \times i\mathrm{C} + \mathrm{E}e \times k\mathrm{C} = \mathrm{F}f \times m\mathrm{C}$. This is very possible, and is often seen in a ship under her mizen topsail, main topsail, and fore-topsail, all parallel to one another, and their surfaces duly proportioned by reefing. If more sails are set, we must always have a similar equilibrium. A certain number of them will have their efforts directed from the larboard arm of the lever im lying to leeward of CI, and a certain number will have their efforts directed from the starboard arm lying to windward of CI. The sum of the products of each of the first set, by their distances from C, must be equal to the sum of the similar products of the other set. As this equilibrium is all that is necessary for preserving the ship's position, and the cessation of it is immediately followed by a conversion; and as these states of the ship may be had by means of the three square sails only, when their surfaces are properly proportioned—it is plain that every movement may be executed and explained by their means. This will greatly simplify our future discussions. We shall therefore suppose in future that they are only the three topsails set, and that their surfaces are so adjusted by reefing, that their actions exactly balance each other round that point C of the middle line AB, where the actions of the water on the different parts of her bottom in like manner balance each other. This point C may be differently situated in the ship according to the leeway she makes, depending on the trim of the sails; and therefore although a certain proportion of the three surfaces may balance each other in one state of leeway, they may happen not to do so in another state. But the equilibrium is evidently attainable in every case, and we therefore shall always suppose it.

50 Consequence of destroying it.

It must now be observed, that when this equilibrium is destroyed, as, for example, by turning the edge of the mizen-topsail to the wind, which the seamen call *shivering* the mizen-topsail, and which may be considered as equivalent to the removing the mizen-topsail entirely, it does not follow that the ship will round the point C, this point remaining fixed. The ship must be considered as a free body, still acted on by a number of forces, which no longer balance each other; and she must therefore *begin* to turn round a spontaneous axis of conversion, which must be determined in the way set forth in the article ROTATION. It is of importance to point out in general where this axis is situated. Therefore let G (fig. 10.) be the centre of gravity of the ship. Draw the line q G v parallel to the yards, cutting D d in q, E e in r, CI in t, and F f in v. While the three sails are set, the line qv may be considered as a lever acted on by four forces, *viz.* D d, impelling the lever forward perpendicularly in the point q; E e, impelling it forward in the point r; F f, impelling it forward in the point v; and CI, impelling it backward in the point t. These forces balance each other both in respect of progressive motion and of rotatory energy; for CI was taken equal to the sum of D d, E e, and F f; so that no acceleration or retardation of the ship's progress in her course is supposed.

But by taking away the mizen-topsail, both the equilibriums are destroyed. A part D d of the accelerating force is taken away; and yet the ship, by her inertia or inherent force, tends, for a moment, to proceed in the direction C p with her former velocity; and by this tendency exerts for a moment the same pressure CI on the water, and sustains the same resistance IC. She must therefore be retarded in her motion by the excess of the resistance IC over the remaining impelling forces E e and F f, that is, by a force equal and opposite to D d. She will therefore be retarded in the same manner as if the mizen-topsail were still set, and a force equal and opposite to its action were applied to G the centre of gravity, and she would soon acquire a smaller velocity, which would again bring all things into equilibrium; and she would stand on in the same course, without changing either her leeway or the position of her head.

But the equilibrium of the lever is also destroyed. It is now acted on by three forces only, *viz.* E e and F f, impelling it forward in the points r and v, and IC impelling it backward in the point t. Make $rv : ro = \mathrm{E}e + \mathrm{F}f : \mathrm{F}f$, and make op parallel to CI and equal to $\mathrm{E}e + \mathrm{F}f$. Then we know, from the common principles of mechanics, that the force op acting at o will have the same momentum or energy to turn the lever round *any* point whatever as the two forces E e and F f applied to r and v; and now the lever is acted on by two forces, *viz.* IC, urging it backwards in the point t and op urging it forwards in the point o. It must therefore turn round like a floating log, which gets two blows in opposite directions. If we now make $\mathrm{IC} - op : op = to : tx$, or $\mathrm{IC} - op : \mathrm{IC} = to : ox$, and apply to the point x a force equal to $\mathrm{IC} - op$ in the direction IC; we know by the common principles of mechanics, that this force $\mathrm{IC} - op$ will produce the same rotation round any point as the two forces IC and op applied in their proper directions at t and o. Let us examine the situation of the point x.

The force $\mathrm{IC} - op$ is evidently $= \mathrm{D}d$, and op is $= \mathrm{E}e + \mathrm{F}f$. Therefore $ot : tx = \mathrm{D}d : op$. But because, when all the sails were filled, there was an equilibrium round C, and therefore round t, and because the force op acting at o is equivalent to E e and F f acting at r and v, we must still have the equilibrium; and therefore we have the momentum $\mathrm{D}d \times qt = op \times ot$. Therefore $ot : tq = \mathrm{D}d : op$, and $tq = tx$. Therefore the point x is the same with the point q.

51 By shivering the mizen-sail.

Therefore, when we shiver the mizen-topsail, the rotation of the ship is the same as if the ship were at rest, and a force equal and opposite to the action of the mizen-topsail were applied at q or at D, or at any point in the line D q.

This might have been shown in another and shorter way. Suppose all sails filled, the ship is in equilibrio. This will be disturbed by applying to D a force opposite to D d; and if the force be also equal to D d, it is evident that these two forces destroy each other, and that this application of the force d D is equivalent to the

the taking away of the mizen-topsail. But we chose to give the whole mechanical investigation; because it gave us an opportunity of pointing out to the reader, in a case of very easy comprehension, the precise manner in which the ship is acted on by the different sails and by the water, and what share each of them has in the motion ultimately produced. We shall not repeat this manner of procedure in other cases, because a little reflection on the part of the reader will now enable him to trace the *modus operandi* through all its steps.

We now see that, in respect both of progressive motion and of conversion, the ship is affected by shivering the sail D, in the same manner as if a force equal and opposite to D *d* were applied at D, or at any point in the line D *d*. We must now have recourse to the principles established under the article ROTATION.

Let p represent a particle of matter, r its radius vector, or its distance p G from an axis passing through the centre of gravity G, and let M represent the whole quantity of matter of the ship. Then its momentum of inertia is $= \int p \cdot r^2$ (see ROTATION, N° 18.) The ship, impelled in the point D by a force in the direction d D, will begin to turn round a spontaneous vertical axis, passing through a point S of the line q G, which is drawn through the centre of gravity G, perpendicular to the direction d D of the external force, and the distance GS of this axis from the centre of gravity is $= \frac{\int p \cdot r^2}{M \cdot Gq}$ (see ROTATION, N° 96.), and it is taken on the opposite side of G from q, that is, S and q are on opposite sides of G.

Let us express the external force by the symbol F. It is equivalent to a certain number of pounds, being the pressure of the wind moving with the velocity V and inclination a on the surface of the sail D; and may therefore be computed either by the theoretical or experimental law of oblique impulses. Having obtained this, we can ascertain the angular velocity of the rotation and the absolute velocity of any given point of the ship by means of the theorems established in the article ROTATION.

52 [...]tion of [...] rudder. But before we proceed to this investigation, we shall consider the action of the rudder, which operates precisely in the same manner. Let the ship AB (fig. 11.) have her rudder in the position AD, the helm being hard a-starboard, while the ship sailing on the starboard tack, and making leeway, keeps on the course a b. The lee surface of the rudder meets the water obliquely. The very foot of the rudder meets it in the direction DE parallel to a b. The parts farther up meet it with various obliquities, and with various velocities, as it glides round the bottom of the ship and falls into the wake. It is absolutely impossible to calculate the accumulated impulse. We shall not be far mistaken in the deflection of each contiguous filament, as it quits the bottom and glides along the rudder; but we neither know the velocity of these filaments, nor the deflection and velocity of the filaments gliding without them. We therefore imagine that all computations on this subject are in vain. But it is enough for our purpose that we know the direction of the absolute pressure which they exert on its surface. It is in the direction D *d*, perpendicular to that surface. We also may be confident that this pressure is very considerable, in proportion to the action of the water on the ship's bows, or of the wind on the sails; and we may suppose it to be nearly in the proportion of the square of the velocity of the ship in her course; but we cannot affirm it to be accurately in that proportion, for reasons that will readily occur to one who considers the way in which the water falls in behind the ship.

It is observed, however, that a fine sailer always steers well, and that all movements by means of the rudder are performed with great rapidity when the velocity of the ship is great. We shall see by and by, that the speed with which the ship performs the angular movements is in the proportion of her progressive velocity: For we shall see that the squares of the times of performing the evolution are as the impulses inversely, which are as the squares of the velocities. There is perhaps no force which acts on a ship that can be more accurately determined by experiment than this. Let the ship ride in a stream or tideway whose velocity is accurately measured; and let her ride from two moorings, so that her bow may be a fixed point. Let a small tow-line be laid out from her stern or quarter at right angles to the keel, and connected with some apparatus fitted up on shore or on board another ship, by which the strain on it may be accurately measured; a person conversant with mechanics will see many ways in which this can be done. Perhaps the following may be as good as any: Let the end of the tow-line be fixed to some point as high out of the water as the point of the ship from which it is given out, and let this be very high. Let a block with a hook be on the rope, and a considerable weight hung on this hook. Things being thus prepared, put down the helm to a certain angle, so as to cause the ship to sheer off from the point to which the far end of the tow-line is attached. This will stretch the rope, and raise the weight out of the water. Now heave upon the rope, to bring the ship back again to her former position, with her keel in the direction of the stream. When this position is attained, note carefully the form of the rope, that is, the angle which its two parts make with the horizon. Call this angle a. Every person acquainted with these subjects knows that the horizontal strain is equal to half the weight multiplied by the co-tangent of a, or that 2 is to the co-tangent of a as the weight to the horizontal strain. Now it is this strain which balances, and therefore measures the action of the rudder, or D e in fig. 11. Therefore to have the absolute impulse D *d*, we must increase D e in the proportion of radius to the secant of the angle b which the rudder makes with the keel. In a great ship sailing six miles in an hour, the impulse on the rudder inclined 30° to the keel is not less than 3000 pounds. The surface of the rudder of such a ship contains near 80 square feet. It is not, however, very necessary to know this absolute impulse D *d*, because it is its part D e alone which measures the energy of the rudder in producing a conversion. Such experiments, made with various positions of the rudder, will give its energies corresponding to these positions, and will settle that long disputed point which is the best position for turning a ship. On the hypothesis that the impulsions of fluids are in the duplicate ratio of the sines of incidence, there can be no doubt that it should make an angle of 54° 44′ with the keel. But the form of a large ship will not admit of this, because a tiller of a length sufficient for managing the rudder in sailing with

53 Greatest in a fine sailer.

54 How to determine it.

with great velocity has not room to deviate above 30° from the direction of the keel; and in this poſition of the rudder the mean obliquity of the filaments of water to its ſurface cannot exceed 40° or 45°. A greater angle would not be of much ſervice, for it is never for want of a proper obliquity that the rudder fails of producing a converſion.

55
Why a ſhip miſſes ſtays, &c.

A ſhip miſſes ſtays in rough weather for want of a ſufficient progreſſive velocity, and becauſe her bows are beat off by the waves: and there is ſeldom any difficulty in wearing the ſhip, if ſhe has any progreſſive motion. It is, however, always deſirable to give the rudder as much influence as poſſible. Its ſurface ſhould be enlarged (eſpecially below) as much as can be done conſiſtently with its ſtrength and with the power of the ſteerſmen to manage it; and it ſhould be put in the moſt favourable ſituation for the water to get at it with great velocity; and it ſhould be placed as far from the axis of the ſhip's motion as poſſible. Theſe points are obtained by making the ſtern-poſt very upright, as has always been done in the French dockyards. The Britiſh ſhips have a much greater rake; but our builders are gradually adopting the French forms, experience having taught us that their ſhips, when in our poſſeſſion, are much more obedient to the helm than our own.—In order to aſcertain the motion produced by the action of the rudder, draw from the centre of gravity a line G q perpendicular to D d (D d being drawn thro' the centre of effort of the rudder). Then, as in the conſideration of the action of the ſails, we may conceive the line q G as a lever connected with the ſhip, and impelled by a force D d acting perpendicularly at q. The conſequence of this will be, an incipient converſion of the ſhip about a vertical axis paſſing through ſome point S in the line q G, lying on the other ſide of G from q; and we have, as in the former caſe, $\text{GS} = \dfrac{\int p \cdot r^2}{\text{M} \cdot \text{G}q}$.

56
The action of the rudder ſimilar to that of the ſails, and very great.

Thus the action and effects of the ſails and of the rudder are perfectly ſimilar, and are to be conſidered in the ſame manner. We ſee that the action of the rudder, though of a ſmall ſurface in compariſon of the ſails, muſt be very great: For the impulſe of water is many hundred times greater than that of the wind; and the arm q G of the lever, by which it acts, is incomparably greater than that by which any of the impulſions on the ſails produces its effect; accordingly the ſhip yields much more rapidly to its action than ſhe does to the lateral impulſe of a ſail.

Obſerve here, that if G were a fixed or ſupported axis, it would be the ſame thing whether the abſolute force D d of the rudder acts in the direction D d, or its tranſverſe part D e acts in the direction D e, both would produce the ſame rotation; but it is not ſo in a free body. The force D d both tends to retard the ſhip's motion and to produce a rotation: It retards it as much as if the ſame force D d had been immediately applied to the centre. And thus the real motion of the ſhip is compounded of a motion of the centre in a direction parallel to D d, and of a motion round the centre. Theſe two conſtitute the motion round S.

57
Employed as an example of the motions of converſion.

As the effects of the action of the rudder are both more remarkable and ſomewhat more ſimple than thoſe of the ſails, we ſhall employ them as an example of the mechaniſm of the motions of converſion in general; and as we muſt content ourſelves in a work like this with what is very general, we ſhall ſimplify the inveſtigation by attending only to the motion of converſion. We can get an accurate notion of the whole motion, if wanted for any purpoſe, by combining the progreſſive or retrograde motion parallel to D d with the motion of rotation which we are about to determine.

In this caſe, then, we obſerve, in the firſt place, that the angular velocity (ſee Rotation, N° 22.) is $\dfrac{\text{D}b \cdot q\text{G}}{\int p r^2}$; and, as was ſhown in that article, this velocity of rotation increaſes in the proportion of the time of the forces uniform action, and the rotation would be uniformly accelerated if the forces did really act uniformly. This, however cannot be the caſe, becauſe, by the ſhip's change of poſition and change of progreſſive velocity, the direction and intenſity of the impelling force is continually changing. But if two ſhips are performing ſimilar evolutions, it is obvious that the changes of force are ſimilar in ſimilar parts of the evolution. Therefore the conſideration of the momentary evolution is ſufficient for enabling us to compare the motions of ſhips actuated by ſimilar forces, which is all we have in view at preſent.

The velocity v, generated in any time t by the continuance of an invariable momentary acceleration (which is all that we mean by ſaying that it is produced by the action of a conſtant accelerating force), is as the acceleration and the time jointly. Now what we call the *angular velocity* is nothing but this momentary acceleration. Therefore the velocity v generated in the time t is $= \dfrac{\text{F} \cdot q\text{G}}{\int p r^2} t$.

58
Angular velocity

The expreſſion of the angular velocity is alſo the expreſſion of the velocity v of a point ſituated at the diſtance 1 from the axis G.

Let z be the ſpace or arch of revolution deſcribed in the time t by this point, whoſe diſtance from G is $= 1$. Then $\dot{z} = v \dot{t} = \dfrac{\text{F} \cdot q\text{G}}{\int p r^2} t \dot{t}$, and taking the fluent $z = \dfrac{\text{F} \cdot q\text{G}}{\int p r^2} t^2$. This arch meaſures the whole angle of rotation accompliſhed in the time t. Theſe are therefore as the ſquares of the times from the beginning of the rotation.

Thoſe evolutions are equal which are meaſured by equal arches. Thus two motions of 45 degrees each are equal. Therefore becauſe z is the ſame in both, the quantity $\dfrac{\text{F} \cdot q\text{G}}{\int p r} t^2$ is a conſtant quantity, and t^2 is reciprocally proportional to $\dfrac{\text{F} \cdot q\text{G}}{\int p r^2}$, or is proportional to $\dfrac{\int p r^2}{\text{F} \cdot q\text{G}}$, and t is proportional to $\dfrac{\sqrt{\int p r^2}}{\sqrt{\text{F} \cdot q\text{G}}}$. That is to ſay, the times of the ſimilar evolutions of two ſhips are as the ſquare root of the momentum of inertia directly, and as the ſquare root of the momentum of the rudder or ſail inverſely. This will enable us to make the compariſon eaſily. Let us ſuppoſe the ſhips perfectly ſimilar in form and rigging, and to differ only in length L and l; $\int \text{P} \cdot \text{R}^2$ is to $\int p r^2$ as L^5 to l^5.

For

For the similar particles P and p contain quantities of matter which are as the cubes of their lineal dimensions, that is, as L^3 to l^3. And because the particles are similarly situated, R^2 is to r^2 as L^2 to l^2. Therefore $P \cdot R^2 : p \cdot r^2 = L^5 : l^5$. Now F is to f as L^2 to l^2. For the surfaces of the similar rudders or sails are as the squares of their lineal dimensions, that is, as L^2 to l^2. And, lastly, G q is to $g\,q$ as L to l, and therefore $F \cdot G\,q : f \cdot g\,q = L^3 : l^3$. Therefore we have $T^2 : t^2 = \frac{\int P \cdot R^2}{F \cdot G\,q} : \frac{\int p \cdot r^2}{f \cdot g\,q} = \frac{L^5}{L^3} : \frac{l^5}{l^3} = L^2 : l^2$, and $T : t = L : l$.

59 ...es of ...ar evolutions with ...ar ...

Therefore the times of performing similar evolutions with similar ships are proportional to the lengths of the ships when both are sailing equally fast; and since the evolutions are similar, and the forces vary similarly in their different parts, what is here demonstrated of the smallest incipient evolutions is true of the whole. They therefore not only describe equal angles of revolution, but also similar curves.

A small ship, therefore, works in less time and in less room than a great ship, and this in the proportion of its length. This is a great advantage in all cases, particularly in wearing, in order to sail on the other tack close-hauled. In this case she will always be to windward and ahead of the large ship, when both are got on the other tack. It would appear at first sight that the large ship will have the advantage in tacking. Indeed the large ship is farther to windward when again trimmed on the other tack than the small ship when she is just trimmed on the other tack. But this happened before the large ship had completed her evolution, and the small ship, in the mean time, has been going forward on the other tack, and going to windward. She will therefore be before the large ship's beam, and perhaps as far to windward.

We have seen that the velocity of rotation is proportional, *cæteris paribus*, to $F \times G\,q$. F means the absolute impulse on the rudder or sail, and is always perpendicular to its surface. This absolute impulse on a sail depends on the obliquity of the wind to its surface. The usual theory says, that it is as the square of the sine of incidence: but we find this not true. We must content ourselves with expressing it by some as yet unknown function φ of the angle of incidence a, and call it $\varphi\,a$; and if S be the surface of the sail, and V the velocity of the wind, the absolute impulse is $n\,V^2\,S \times \varphi\,a$. This acts (in the case of the mizen-topsail, fig. 10.) by the lever q·G, which is equal to $DG \times \text{cos. } DG\,q$, and $DG\,q$ is equal to the angle of the yard and keel; which angle we formerly called b. Therefore its energy in producing a rotation is $n\,V^2\,S \times \varphi\,a \times DG \times \text{cos. } b$. Leaving out the constant quantities n, V^2, S, and DG, its energy is proportional to $\varphi\,a \times \text{cos. } b$. In order, therefore, that any sail may have the greatest power to produce a rotation round G, it must be so trimmed that $\varphi\,a \times \text{cos. } b$ may be a maximum. Thus, if we would trim the sails on the foremast, so as to pay the ship off from the wind right ahead with the greatest effect, and if we take the experiments of the French academicians as proper measures of the oblique impulses of the wind on the sail, we will brace up the yard to an angle of 48 degrees with the keel. The impulse corresponding to 48° is 615, and the cosine of 48° is 669. These give a product of 411435. If we brace the sail to 54.44, the angle assigned by the theory, the effective impulse is 405274. If we make the angle 45°, the impulse is 408774. It appears then that 48° is preferable to either of the others. But the difference is inconsiderable, as in all cases of maximum a small deviation from the best position is not very detrimental. But the difference between the theory and this experimental measure will be very great when the impulses of the wind are of necessity very oblique. Thus, in tacking ship, as soon as the headsails are taken aback, they serve to aid the evolution, as is evident: But if we were now to adopt the maxim inculcated by the theory, we should immediately round in the weather-braces, so as to increase the impulse on the sail, because it is then very small; and although we by this means make yard more square, and therefore diminish the rotatory momentum of this impulse, yet the impulse is more increased (by the theory) than its vertical lever is diminished.—

60 A nice point of seamanship.

Let us examine this a little more particularly, because it is reckoned one of the nicest points of seamanship to aid the ship's coming round by means of the headsails; and experienced seamen differ in their practice, in this manœuvre. Suppose the yard braced up to 40°, which is as much as can be usually done, and that the sail shivers (the bowlines are usually let go when the helm is put down), the sail immediately takes aback, and in a moment we may suppose an incidence of 6 degrees. The impulse corresponding to this is 400 (by experiment), and the cosine of 40° is 766. This gives 306400 for the effective impulse. To proceed according to the theory, we should brace the yard to 70°, which would give the wind (now 34° on the weather-bow) an incidence of nearly 36°, and the sail an inclination of 20° to the intended motion, which is perpendicular to the keel. For the tangent of 20° is about ½ of the tangent of 36°. Let us now see what effective impulse the experimental law of oblique impulsions will give for this adjustment of the sails. The experimental impulse for 36° is 480; the cosine of 70° is 342; the product is 164160, not much exceeding the half of the former. Nay, the impulse for 36°, calculated by the theory, would have been only 346, and the effective impulse only 118332. And it must be farther observed, that this theoretical adjustment would tend greatly to check the evolution, and in most cases would entirely mar it, by checking the ship's motion ahead, and consequently the action of the rudder, which is the most powerful agent in the evolution; for here would be a great impulse directed almost astern.

We were justifiable, therefore, in saying, in the beginning of this article, that a seaman would frequently find himself baffled if he were to work a ship according to the rules deduced from M. Bouguer's work; and we see by this instance of what importance it is to have the oblique impulsions of fluids ascertained experimentally. The practice of the most experienced seamen is directly the opposite to this theoretical maxim, and its success greatly confirms the usefulness of these experiments of the academicians so often praised by us.

We return again to the general consideration of the rotatory motion. We found the velocity $v = \frac{F \cdot q\,G}{\int p\,r^2}$. It is therefore proportional *cæteris paribus*, to q G. We have seen in what manner q G depends on the position

tion and situation of the sail or rudder when the point G is fixed. But it also depends on the position of G. With respect to the action of the rudder, it is evident that it is so much the more powerful as it is more remote from G. The distance from G may be increased either by moving the rudder farther aft or G farther forward. And as it is of the utmost importance that a ship answer her helm with the greatest promptitude, these circumstances have been attended to which distinguished fine steering ships from such as had not this quality; and it is in a great measure to be ascribed to this, that, in the gradual improvement of naval architecture, the centre of gravity has been placed far forward. Perhaps the notion of a centre of gravity did not come into the thoughts of the rude builders in early times; but they observed that those boats and ships steered best which had their extreme breadth before the middle point, and consequently the bows not so acute as the stern. This is so contrary to what one would expect, that it attracted attention more forcibly; and, being somewhat mysterious, it might prompt to attempts of improvement, by exceeding in this singular maxim. We believe that it has been carried as far as is compatible with other essential requisites in a ship.

61 Of importance to determine the best place for a ship's centre of gravity.

We believe that this is the chief circumstance in what is called the trim of a ship; and it were greatly to be wished that the best place for the centre of gravity could be accurately ascertained. A practice prevails, which is the opposite of what we are now advancing. It is usual to load a ship so that her keel is not horizontal, but lower abaft. This is found to improve her steerage. The reason of this is obvious. It increases the acting surface of the rudder, and allows the water to come at it with much greater freedom and regularity; and it generally diminishes the griping of the ship forward, by removing a part of the bows out of the water. It has not always this effect; for the form of the harping aloft is frequently such, that the tendency to gripe is diminished by immersing more of the bow in the water.

But waving these circumstances, and attending only to the rotatory energy of the rudder, we see that it is of advantage to carry the centre of gravity forward. The same advantage is gained to the action of the after sails. But, on the other hand, the action of the head sails is diminished by it; and we may call every sail a headsail whose centre of gravity is before the centre of gravity of the ship; that is, all the sails hoisted on the bowsprit and foremost, and the staysails hoisted on the mainmast; for the centre of gravity is seldom far before the mainmast.

Suppose that when the rudder is put into the position AD (fig. 11.), the centre of gravity could be shifted to g, so as to increase q G, and that this is done without increasing the sum of the products $p\,r^2$. It is obvious that the velocity of conversion will be increased in the proportion of q G to $q\,g$. This is very possible, by bringing to that side of the ship parts of her loading which were situated at a distance from G on the other side. Nay, we can make this change in such a manner that $\int p\,r^2$ shall even be less than it was before, by taking care that every thing which we shift shall be nearer to g than it was formerly to G. Suppose it all placed in on spot m. and that m is the quantity of matter so shifted, while M is the quantity of matter in the whole ship. It is only necessary that $m \cdot g\,G^2$ shall be hless than the sum of the products $p\,r^2$ corresponding to the matter which has been shifted. Now, although the matter which is easily moveable is generally very small in comparison to the whole matter of the ship, and therefore can make but a small change in the place of the centre of gravity, it may frequently be brought from places so remote, that it may occasion a very sensible diminution of the quantity $\int p\,r^2$, which expresses the whole momentum of inertia.

62 A prac- of sea- in putt- about - plaine-

This explains a practice of the seamen in small wherries or skiffs, who in putting about are accustomed to place themselves to leeward of the mast. They even find that they can aid the quick motions of these light boats by the way in which they rest on their two feet, sometimes leaning all on one foot, and sometimes on the other. And we have often seen this evolution very sensibly accelerated in a ship of war, by the crew running suddenly, as the helm is put down to the lee-bow. And we have heard it asserted by very expert seamen, that after all attempts to wear ship (after lying-to in a storm) have failed, they have succeeded by the crew collecting themselves near the weather fore-shrouds the moment the helm was put down. It must be agreeable to the reflecting seaman to see this practice supported by undoubted mechanical principles.

63 The e- tion a- rated b- dition- matter

It will appear paradoxical to say that the evolution may be accelerated even by an addition of matter to the ship; and though it is only a piece of curiosity, our readers may wish to be made sensible of it. Let m be the addition, placed in some point m lying beyond G from q. Let S be the spontaneous centre of conversion before the addition. Let v be the velocity of rotation round g, that is, the velocity of a point whose distance from g is 1, and let ϱ be the radius vector, or distance of a particle from g. We have (ROTATION, N° 22.) $v = \dfrac{F \cdot q\,g}{\int p\,\varrho^2 + m \cdot m\,g^2}$. But we know (ROTATION, N° 23.) that $\int p\,\varrho^2 = \int p\,r^2 + M \cdot G\,g^2$. Therefore $v = \dfrac{F \cdot q\,g}{\int p\,r^2 + M \cdot G\,g^2 + m \cdot m\,g^2}$. Let us determine G$g$ and $m\,g$ and $q\,g$.

Let m G be called z. Then, by the nature of the centre of gravity, $M + m : M = G\,m : g\,m = z : g\,m$, and $g\,m = \dfrac{M}{M+m}\,z$, and $m \cdot g\,m^2 = \dfrac{m\,M^2}{\overline{M+m}^2}\,z^2$. In like manner, $M \cdot G\,g^2 = \dfrac{M\,m^2}{\overline{M+m}^2}\,z^2$. Now $m\,M^2 + M\,m^2 = M\,m \times \overline{M+m}$. Therefore $M \cdot G\,g^2 + m \cdot g\,m^2 = \dfrac{M\,m \times (M+m)}{\overline{M+m}^2}\,z^2, = \dfrac{M\,m}{M+m}\,z^2$. Let n be $= \dfrac{m}{M+m}$, then $M \cdot G\,g^2 + m \cdot g\,m^2 = M\,n\,z^2$. Also G$g = n\,z$, being $= \dfrac{m}{M+n}\,z$. Let q G be called c: then $q\,g = c + n\,z$. Also let SG be called e.

We have now for the expression of the velocity $v = \dfrac{F\,(c + n\,z)}{\int p\,r^2 + M\,n\,z}$, or $v = \dfrac{F}{M} \times \dfrac{c + n\,z}{\dfrac{\int p\,r^2}{M} + n\,z^2}$. But

(ROTATION, N° 30) $\frac{\int p r^2}{M} = ce$. Therefore, finally, $v = \frac{F}{M} \times \frac{c + nz}{ce + nz^2}$. Had there been no addition of matter made, we should have had $v = \frac{F}{M} \times \frac{c}{ce}$. It remains to show, that z may be so taken that $\frac{c}{ce}$ may be less than $\frac{c + nz}{ce + nz^2}$. Now, if c be to z as ce to z^2, that is, if z be taken equal to c, the two fractions will be equal. But if z be less than e, that is, if the additional matter is placed anywhere between S and G, the complex fraction will be greater than the fraction $\frac{c}{ce}$, and the velocity of rotation will be increased. There is a particular distance which will make it the greatest possible; namely, when z is made $= \frac{1}{n} (\sqrt{c^2 + nce} - c)$, as will easily be found by treating the fraction $\frac{c + nz}{ce + nz^2}$, with z, considered as the variable quantity, for a maximum. In what we have been saying on this subject, we have considered the rotation only in as much as it is performed round the centre of gravity, although in every moment it is really performed round a spontaneous axis

64 [Ro]tation performed round a spontaneous axis.

lying beyond that centre. This was done because it afforded an easy investigation, and any angular motion round the centre of gravity is equal to the angular motion round any other point. Therefore the extent and the time of the evolution are accurately defined.—From observing that the energy of the force F is proportional to q G, an inattentive reader will be apt to conceive the centre of gravity as the centre of motion, and the rotation as taking place because the momenta of the sails and rudder, on the opposite sides of the centre of gravity, do not balance each other. But we must always keep in mind that this is not the cause of the rotation. The cause is the want of equilibrium round the point C (fig. 10.), where the actions of the water balance each other. During the evolution, which consists of a rotation combined with a progressive motion, this point C is continually shifting, and the unbalanced momenta which continue the rotation always respect the momentary situation of the point C. It is nevertheless always true that the energy of a force F is proportional (*cæteris paribus*) to q G, and the rotation is always made in the same direction as if the point G were really the centre of conversion. Therefore the mainsail acts always (when oblique) by pushing the stern away from the wind, although it should sometimes act on a point of the vertical lever through C, which is ahead of C.

These observations on the effects of the sails and rudder in producing a conversion, are sufficient for enabling us to explain any case of their action which may occur. We have not considered the effects which they tend to produce by inclining the ship round a horizontal axis, viz. the motions of rolling and pitching. See ROLLING and PITCHING. To treat this subject properly would lead us into the whole doctrine of the equilibrium of floating bodies, and it would rather lead to maxims of construction than to maxims of manœuvre. M. Bouguer's *Traité du Navire* and Euler's *Scientia Navalis* are excellent performances on this subject, and we are not here obliged to have recourse to any erroneous theory.

65 Different operations of the water on the ship and wind on the sails balance each other.

It is easy to see that the lateral pressure both of the wind on the sails and of the water on the rudder tends to incline the ship to one side. The sails also tend to press the ship's bows into the water, and, if she were kept from advancing, would press them down considerably. But by the ship's motion, and the prominent form of her bows, the resistance of the water to the fore part of the ship produces a force which is directed upwards. The sails also have a small tendency to raise the ship, for they constitute a surface which in general separates from the plumb-line below. This is remarkably the case in the staysails, particularly the jib and fore-topmast staysail. And this helps greatly to soften the plunges of the ship's bows into the head seas. The upward pressure also of the water on her bows, which we just now mentioned, has a great effect in opposing the immersion of the bows which the sails produce by acting on the long levers furnished by the masts. M. Bouguer gives the name of *point velique* to the point V (fig. 12.) of the mast, where it is cut by the line CV, which marks the mean place and direction of the whole impulse of the water on the bows. And he observes, that if the mean direction of all the actions of the wind on the sails be made to pass also through this point there will be a perfect equilibrium, and the ship will have no tendency to plunge into the water or to rise out of it; for the whole action of the water on the bows, in the direction CV, is equivalent to, and may be resolved into the action CE, by which the progressive motion is resisted, and the vertical action CD, by which the ship is raised above the water. The force CE must be opposed by an equal force VD, exerted by the wind on the sails, and the force CD is opposed by the weight of the ship. If the mean effort of the sails passes above the point V, the ship's bows will be pressed into the water; and if it pass below V, her stern will be pressed down. But, by the union of these forces, she will rise and fall with the sea, keeping always in a parallel position. We apprehend that it is of very little moment to attend to the situation of this point. Except when the ship is right afore the wind, it is a thousand chances to one that the line CV of mean resistance does not pass through any mast; and the fact is, that the ship cannot be in a state of uniform motion on any other condition but the perfect union of the line of mean action of the sails, and the line of mean action of the resistance. But its place shifts by every change of leeway or of trim; and it is impossible to keep these lines in one constant point of intersection for a moment, on account of the incessant changes of the surface of the water on which she floats. M Bouguer's observations on this point, are, however, very ingenious and original.

66 Chief evolutions described.

We conclude this dissertation, by describing some of the chief movements or evolutions. What we have said hitherto is intended for the instruction of the artist, by making him sensible of the mechanical procedure. The description is rather meant for the amusement of the landsman, enabling him to understand operations that are familiar to the seaman. The latter will perhaps smile at the awkward account given of his business by one who cannot hand, reef, nor steer.

To tack Ship.

The ship must first of all be kept full, that is, with a

a very sensible angle of incidence on the sails, and by no means hugging the wind. For as this evolution is chiefly performed by the rudder, it is necessary to give the ship a good velocity. When the ship is observed to luff up of herself, that moment is to be catched for beginning the evolution, because she will by her inherent force continue this motion. The helm is then put down. When the officer calls out Helm's a-lee, the fore-sheet, fore-top bowline, jib, and flag sail sheets forward are let go. The jib is frequently hauled down. Thus the obstacles to the ship's head coming up to the wind by the action of the rudder are removed. If the mainsail is set, it is not unusual to clue up the weather side, which may be considered as a headsail, because it is before the centre of gravity. The mizen must be hauled out, and even the sail braced to windward. Its power in paying off the stern from the wind conspires with the action of the rudder. It is really an aerial rudder. The sails are immediately taken aback. In this state the effect of the mizen-topsail would be to obstruct the movement, by pressing the stern the contrary way to what it did before. It is therefore either immediately braced about sharp on the other tack, or lowered. Bracing it about evidently tends to pay round the stern from the wind, and thus assist in bringing the head up to the wind. But in this position it checks the progressive motion of the ship, on which the evolution chiefly depends. For a rapid evolution, therefore, it is as well to lower the mizen-topsail. Meantime, the headsails are all aback, and the action of the wind on them tends greatly to pay the ship round. To increase this effect, it is not unusual to haul the fore-top bowline again. The sails on the mainmast are now almost becalmed; and therefore when the wind is right ahead, or a little before, the mainsail is hauled round and braced up sharp on the other tack with all expedition. The staysail sheets are now shifted over to their places for the other tack. The ship is now entirely under the power of the headsails and of the rudder, and their actions conspire to promote the conversion. The ship has acquired an angular motion, and will preserve it, so that now the evolution is secured, and she falls off apace from the wind on the other tack. The farther action of the rudder is therefore unnecessary, and would even be prejudicial, by causing the ship to fall off too much from the wind before the sails can be shifted and trimmed for sailing on the other tack. It is therefore proper to right the helm when the wind is right ahead, that is, to bring the rudder into the direction of the keel. The ship continues her conversion by her inherent force and the action of the headsails.

When the ship has fallen off about four points from the wind, the headsails are hauled round, and trimmed sharp on the other tack with all expedition; and although this operation was begun with the wind four points on the bow, it will be six before the sails are braced up, and therefore the headsails will immediately fill. The after-sails have filled already, while the headsails were inactive, and therefore immediately check the farther falling off from the wind. All sails now draw, for the staysail sheets have been shifted over while they were becalmed or shaking in the wind. The ship now gathers way, and will obey the smallest motion of the helm to bring her close to the wind.

We have here supposed, that during all this operation the ship preserves her progressive motion. She must therefore have described a curve line, advancing all the while to windward. Fig. 13. is a representation of this evolution when it is performed in the completest manner. The ship standing on the course E *a*, with the wind blowing in the direction WF, has her helm put hard a-lee when she is in the position A. She immediately deviates from her course, and describing a curve, comes to the position B, with the wind blowing in the direction WF of the yards, and the square-sails now shiver. The mizen-topsail is here represented braced sharp on the other tack, by which its tendency to aid the angular motion (while it checks the progressive motion) is distinctly seen. The main and foresails are now shivering, and immediately after are taken aback. The effect of this on the headsails is distinctly seen to be favourable to the conversion, by pushing the point F in the direction F *i*; but for the same reason it continues to retard the progressive motion. When the ship has attained to the position C, the mainsail is hauled round and trimmed for the other tack. The impulse in the direction F *i* still aids the conversion and retards the progressive motion. When the ship has attained a position between C and D, such that the main and mizen topsail yards are in the direction of the wind, there is nothing to counteract the force of the headsails to pay the ship's head off from the wind. Nay, during the progress of the ship to this intermediate position, if any wind gets at the main or mizen topsails, it acts on their anterior surfaces, and impels the after parts of the ship away from the curve *a b c d*, and thus aids the revolution. We have therefore said, that when once the sails are taken fully aback, and particularly when the wind is brought right ahead, it is scarce possible for the evolution to fail; as soon therefore as the main-topsail (trimmed for the other tack) shivers, we are certain that the headsails will be filled by the time they are hauled round and trimmed. The staysails are filled before this, because their sheets have been shifted, and they stand much sharper than the square-sails; and thus every thing tends to check the falling off from the wind on the other tack, and this no sooner than it should be done. The ship immediately gathers way, and holds on in her new course *d* G.

But it frequently happens, that in this conversion the ship loses her whole progressive motion. This sometimes happens while the sails are shivering before they are taken fully aback. It is evident, that in this case there is little hopes of success, for the ship now lies like a log, and neither sails nor rudder have any action. The ship drives to leeward like a log, and the water acting on the lee-side of the rudder checks a little the driving of the stern. The head therefore falls off again, and by and by the sails fill, and the ship continues on her former tack. This is called MISSING STAYS, and it is generally owing to the ship's having too little velocity at the beginning of the evolution. Hence the propriety of keeping the sails well filled for some little time before. Rough weather, too, by raising a wave which beats violently on the weather-bow, frequently checks the first luffing of the ship, and beats her off again.

If the ship loses all her motion after the headsails have been fully taken aback, and before we have brought the wind right ahead, the evolution becomes uncertain, but by no means desperate; for the action of

of the wind of the headfails will prefently give her ftern-way. Suppofe this to happen when the fhip is in the pofition C. Bring the helm over hard to windward, fo that the rudder fhall have the pofition reprefented by the fmall dotted line *o f*. It is evident, that the refiftance of the water to the ftern-way of the rudder acts in a favourable direction, pufhing the ftern outwards. In the mean time, the action of the wind on the headfails pufhes the head in the oppofite direction. Thefe actions confpire therefore in promoting the evolution; and if the wind is right-ahead, it cannot fail, but may even be completed fpeedily, becaufe the fhip gathers ftern-way, and the action of the rudder becomes very powerful; and as foon as the wind comes on the formerly lee-bow, the action of the water on the now lee-quarter will greatly accelerate the converfion. When the wind therefore has once been brought nearly right ahead, there is no rifk of being baffled.

But fhould the fhip have loft all her head-way confiderably before this, the evolution is very uncertain; for the action of the water on the rudder may not be nearly equal to its contrary action on the lee-quarter: in which cafe, the action of the wind on the headfails may not be fufficient to make up the difference. When this is obferved, when the fhip goes aftern without changing her pofition, we muft immediately throw the headfails completely aback, and put the helm down again, which will pay off the fhip's head from the wind enough to enable us to fill the fails again on the fame tack, to try our fortune again; or we muft BOXHAUL the fhip, in the manner to be defcribed by and by.

Such is the ordinary procefs of tacking fhip; a procefs in which all the different modes of action of the rudder and fails are employed. To execute this evolution in the moft expeditious manner, and fo as to gain as much on the wind as poffible, is confidered as the teft of an expert feaman. We have defcribed the procefs which is beft calculated for *enfuring* the movement. But if the fhip be failing very brifkly in fmooth water, fo that there is no danger of miffing ftays, we may gain more to windward confiderably by keeping faft the fore-top bowline and the jib and ftay-fail fheets till the fquare-fails are all fhivering; For thefe fails, continuing to draw with confiderable force, and balancing each other tolerably fore and aft, keep up the fhip's velocity very much, and thus maintain the power of the rudder. If we now let all fly when the fquare-fails are fhivering, the fhip may be confidered as without fails, but expofed to the action of the water on the lee-bow; from which arifes a ftrong preffure of the bow to windward, which confpires with the action of the rudder to aid the converfion. It evidently leaves all that tendency of the bow to windward which arifes from lee-way, and even what was counteracted by the formerly unbalanced action of thefe head-ftayfails. This method lengthens the whole time of the evolution, but it advances the fhip to windward. Obferve, too, that keeping faft the fore-top bowline till the fail fhivers, and then letting it go, infures the tacking aback of that fail, and thus inftantly produces an action that is favourable to the evolution.

The moft expert feamen, however, differ among themfelves with refpect to thefe two methods, and the firft is the moft generally practifed in the Britifh navy, becaufe the leaft liable to fail. The forces which oppofe the converfion are fooner removed, and the production of a favourable action by the backing of the fore-topfail is alfo fooner obtained, by letting go the fore-top bowline at the firft.

Having entered fo minutely into the defcription and rationale of this evolution, we have fufficiently turned the reader's attention to the different actions which co-operate in producing the motions of converfion. We fhall therefore be very brief in our defcription of the other evolutions.

To wear Ship.

When the feaman fees that his fhip will not go about head to wind, but will mifs ftays, he muft change his tack the other way; that is, by turning her head away from the wind, going a little way before the wind, and then hauling the wind on the other tack. This is called WEARING or VEERING fhip. It is moft neceffary in ftormy weather with little fail, or in very faint breezes, or in a difabled fhip.

The procefs is exeeedingly fimple; and the mere narration of the procedure is fufficient for fhowing the propriety of every part of it.

Watch for the moment of the fhip's falling off, and then haul up the mainfail and mizen, and fhiver the mizen-topfail, and put the helm a-weather. When the fhip falls off fenfibly (and not before), let go the bowlines. Eafe away the fore-fheet, raife the fore-tack, and gather aft the weather fore-fheet, as the lee-fheet is eafed away. Round in the weather-braces of the fore and main-mafts, and keep the yards nearly bifecting the angle of the wind and keel, fo that when the fhip is before the wind the yards may be fquare. It may even be of advantage to round in the weather-braces of the main-topfail more than thofe of the headfails; for the mainmaft is abaft the centre of gravity. All this while the mizen-topfail muft be kept fhivering, by rounding in the weather-braces as the fhip pays off from the wind. Then the main-topfail will be braced up for the other tack by the time that we have brought the wind on the weather-quarter. After this it will be full, and will aid the evolution. When the wind is right aft, fhift the jib and ftay-fail fheets. The evolution now goes on with great rapidity; therefore brifkly haul on board the fore and main tacks, and haul out the mizen, and fet the mizen-ftayfail as foon as they will take the wind the right way. We muft now check the great rapidity with which the fhip comes to the wind on the other tack, by righting the helm before we bring the wind on the beam: and all muft be trimmed fharp fore and aft by this time, that the headfails may take and check the coming-to. All being trimmed, ftand on clofe by the wind.

We cannot help lofing a great deal of ground in this movement. Therefore, though it be very fimple, it requires much attention and rapid execution to do it with as little lofs of ground as poffible. One is apt to imagine at firft that it would be better to keep the headfails braced up on the former tack, or at leaft not to round in the weather-braces fo much as is here directed. When the fhip is right afore the wind, we fhould expect affiftance from the obliquity of the headfails; but the rudder being the principal agent in the evolution, it is found that more is gained by increafing the fhip's velocity, than by a fmaller impulfe on the

headsails more favourably directed. Experienced seamen differ, however, in their practice in respect of this particular.

To loxhaul a Ship.

This is a process performed only in critical situations, as when a rock, a ship, or some danger, is suddenly seen right ahead, or when a ship misses stays. It requires the most rapid execution.

The ship being close-hauled on a wind, haul up the mainsail and mizen, and shiver the topsails, and put the helm hard a-lee altogether. Raise the fore-tack, let go the head bowlines, and brace about the headsails sharp on the other tack. The ship will quickly lose her way, get stern-way, and then fall off, by the joint action of the headsails and of the inverted rudder. When she has fallen off eight points, brace the after-sails square, which have hitherto been kept shivering. This will at first increase the power of the rudder, by increasing the stern-way, and at the same time it makes no opposition to the conversion which is going on. The continuation of her circular motion will presently cause them to take the wind on their after surfaces. This will check the stern-way, stop it, and give the ship a little head-way. Now shift the helm, so that the rudder may again act in conjunction with the headsails in paying her off from the wind. This is the critical part of the evolution, because the ship has little or no way through the water, and will frequently remain long in this position. But as there are no counteracting forces, the ship continues to fall off. Then the weather-braces of the after-sails may be gently rounded in, so that the wind acting on their hinder surfaces may both push the ship a little ahead and her stern laterally in conjunction with the rudder. Thus the wind is brought upon the quarter, and the headsails shiver. By this time the ship has acquired some headway. A continuation of the rotation would now fill the headsails, and their action would be contrary to the intended evolution. They are therefore immediately braced the other way, nearly square, and the evolution is now completed in the same manner with wearing ship.

Some seamen brace all the sails aback the moment that the helm is put hard a-lee, but the after-sails no more aback than just to square the yards. This quickly gives the ship stern-way, and brings the rudder into action in its inverted direction; and they think that the evolution is accelerated by this method.

There is another problem of seamanship deserving of our attention, which cannot properly be called an evolution. This is lying-to. This is done in general by laying some sails aback, so as to stop the head-way produced by others. But there is a considerable address necessary for doing this in such a way that the ship shall lie easily, and under command, ready to proceed in her course, and easily brought under weigh.

To bring-to with the fore or main topsail to the mast, brace that sail sharp aback, haul out the mizen, and clap the helm hard a-lee.

Suppose the fore-topsail to be aback; the other sails shoot the ship ahead, and the lee-helm makes the ship come up to the wind, which makes it come more perpendicularly on the sail which is aback. Then its impulse soon exceeds those on the other sails, which are now shivering, or almost shivering. The ship stands still a while, and then falls off, so as to fill the after-sails, which again shoot her ahead, and the process is thus repeated. A ship lying-to in this way goes a good deal ahead and also to leeward. If the main-topsail be aback, the ship shoots ahead, and comes up till the diminishing impulse of the drawing sails in the direction of the keel is balanced by the increased impulse on the main-topsail. She lies a-long while in this position, driving slowly to leeward; and she at last falls off by the beating of the water on her weather-bow. She falls off but little, and soon comes up again.

Thus a ship lying-to is not like a mere log, but has a certain motion which keeps her under command. To get under weigh again, we must watch the time of falling off; and when this is just about to finish, brace about briskly, and fill the sail which was aback. To aid this operation, the jib and fore-topmast staysail may be hoisted, and the mizen brailed up: or, when the intended course is before the wind or large, back the fore-topsail sharp, shiver the main and mizen topsail, brail up the mizen, and hoist the jib and fore-topmast staysails altogether.

In a storm with a contrary wind, or on a lee shore, a ship is obliged to lie-to under a very low sail. Some sail is absolutely necessary, in order to keep the ship steadily down, otherwise she would kick about like a cork, and roll so deep as to strain and work herself to pieces. Different ships behave best under different sails. In a very violent gale, the three lower staysails are in general well adapted for keeping her steady, and distributing the strain. This mode seems also well adapted for wearing, which may be done by hauling down the mizen-staysail. Under whatever sail the ship is brought-to in a storm, it is always with a fitted sail, and never with one laid aback. The helm is lashed down hard a-lee; therefore the ship shoots ahead, and comes up till the sea on her weather-bow beats her off again. Getting under weigh is generally difficult: because the ship and rigging are lofty abaft, and hinder her from falling off readily when the helm is put hard a-weather. We must watch the falling off, and assist the ship by some small headsail. Sometimes the crew get up on the weather fore-shrouds in a crowd, and thus present a surface to the wind.

These examples of the three chief evolutions will enable those who are not seamen to understand the propriety of the different steps, and also to understand the other evolutions as they are described by practical authors. We are not acquainted with any performance in our language where the whole are considered in a connected and systematical manner. There is a book on this subject in French, called *La Manœuvrier*, by M. Bourdé de Ville-Huet, which is in great reputation in France. A translation into English was published some years ago, said to be the performance of the Chevalier de Sauseuil a French officer. But this appears to be a bookseller's puff; for it is undoubtedly the work of some person who did not understand either the French language, or the subject, or the mathematical principles which are employed in the scientific part. The blunders are not such as could possibly be made by a Frenchman not versant in the English language, but natural for an Englishman ignorant of French. No French gentleman or officer would have translated a work of this

this kind (which he professes to think so highly of) to serve the rivals and foes of his country. But indeed it can do no great harm in this way; for the scientific part of it is absolutely unintelligible for want of science in the translator; and the practical part is full of blunders for want of knowledge of the French language.

We offer this account of the subject with all proper respect and diffidence. We do not profess to teach: but by pointing out the defects of the celebrated works of M. Bouguer, and the course which may be taken to remove them, while we preserve much valuable knowledge which they contain, we may perhaps excite some persons to apply to this subject, who, by a combination of what is just in M. Bouguer's theory, with an experimental doctrine of the impulses of fluids, may produce a treatise of seamanship which will not be confined to the libraries of mathematicians, but become a manual for seamen by profession.

SEAMEN, such persons as serve the king or others at sea by navigating and fighting ships, &c. See *Maritime State*.

Seamen fighting, quarrelling, or making any disturbance, may be punished by the commissioners of the navy with fine and imprisonment. Registered seamen are exempted from serving in any parish office, &c. and are allowed bounty-money beside their pay. By the law of merchants, the seamen of a vessel are accountable to the master or commander, the master to the owners, and the owners to the merchants, for damage sustained either by negligence or otherwise. Where a seaman is hired for a voyage, and he deserts before it is ended, he shall lose his wages; and in case a ship be lost in a storm, the seamen lose their wages, as well as the owners their freight.

Means of Preserving the Health of Seamen. See Medicine, N°. 351.

In addition to what has been said on this subject in the place referred to, we shall subjoin some valuable observations which we have met with in the sixth volume of the Memoirs of the Royal Society of Medicine at Paris for the years 1784 and 1785.

In 1783, the marshal de Castries, intending to make some changes in the regulations of the navy, particularly with regard to diet, proposed to the society the two following questions: 1. "What are the most wholesome aliments for seamen, considering the impossibility of procuring them fresh meat? And what kinds of salt meat, or fish, of pulse, and of drink, are most proper for them, and in what quantity, not omitting to inquire into the regimens in use amongst other maritime nations for what may be adopted by us, and into what experience has evinced the utility of, from the accounts of the most celebrated navigators?" 2. "A number of patients labouring under different diseases lieing assembled in naval hospitals, and different constitutions affected by the same disease requiring difference of diet, what general dietetic rules for an hospital would be best adapted to every exigence, dividing the patients into three classes; the first in which liquids alone are proper, the second in which we begin to give solids in small quantities, and the state of convalescence in which a fuller diet is necessary?" A committee was appointed to draw up an answer to these, who investigated the subject very minutely. The result of their labours is there given at large. The observations most worthy of notice are, that the scurvy of the English seamen, who live chiefly on salt meat, is a putrid disease; whilst that of the Dutch, who use farinaceous vegetables and dried pulse in large quantities, has more of an hydropical tendency. A mixture of both, even at the same meal, is recommended. This is supported by philosophical reasoning, and the example of Captain Cook, who was partly indebted to this mixed regimen for the preservation of his crew. Salt fish should never be used: salt beef grows hard, and after boiling its fibrous parts only remain, which are more calculated to load the stomach than recruit the strength. Salt bacon may be kept at sea 18 months; it does not lose its moist and nutrimental parts, and unites better with pulse, but should not be used when rancid. Live animals kept on board ships tend to produce diseases amongst the crew. Rice should be used largely. Our puddings are bad food: the flour would be much better made into bread, which might be done at sea with no great trouble. Sour krout should be used freely. Mustard, vinegar, sugar, melasses and honey, are good antiscorbutics. Of drinks, wine is the best: wort, spruce-beer, or the Russian *quas*, are good substitutes. Spirits are only to be used in cold climates, and in small quantity. The greater part of the excellent memoir in answer to the second question, perfectly coincides with M. Duhamel du Monceaux's "Means of Preserving the Health of Seamen," and M. Poissonnier des Perrieres's treatises "On the Diseases of Seamen," and "On the advantages of changing the Diet of Seamen," and his "Examination of Pringle's Dissertation."

SEAPOYS, or Sepoys, natives of Indostan serving in a military capacity under the European powers, and disciplined after the European manner.

The Seapoys of the English East India Company compose perhaps the most numerous, regular, and best disciplined body of black troops in the world. They are raised from among the natives of the country, and consist of Moors or Mahometans, Raja-poots, Hindoos, Pariars, besides many intermediate casts peculiar to themselves; the whole modelled in all corresponding particulars, and disciplined in every respect, as the army of Great Britain.

The military establishments of Bengal, Madras, and Bombay, have each their respective numbers, that of Bengal exceeding the rest. The Seapoys are formed into complete, uniform, and regular battalions, as our marching regiments at home, being intended to represent and answer fully to every purpose in India to the like troops in Europe. A battalion consists of 700 men, of complete effective strength. In each there are eight companies, including two flank ones or grenadiers. They are respectively commanded by their own black and European officers; to each company there is attached a subaltern, who takes the command, under whom are two native commissioned officers, bearing the rank of subidar and jimindar; of eight subalterns, six are

Seapoys. are lieutenants, the other ensigns; exclusive is a staff, of adjutant and surgeon. The black non-commissioned officers answer to our serjeants and corporals, and are called *havildars* and *naigues*. There is also to each corps an English serjeant-major, drill and store serjeant; to each battalion is a band of drums and fifes, and to each a pair of colours. A captain commands the whole.

Their jackets, which are made entirely after the European fashion, are of a red colour with yellow facings (as worn by all the infantry of the Company on the Coromandel coast). The remaining part of their attire resembles more the country or Indian habit, and consists of a dark blue turban, broad and round at top, descending deep to the bottom, the sides of which, of a concave form, are crossed by a white band, running in front, fastened under a rose above. As an under garment, they have a jacket of linen. A dark blue sash girding, to answer the turban, goes round their middle. On the thighs they have short drawers, fastened by a scolloped band. Their legs are bare, which renders them more ready for action or service. Their arms are a firelock and bayonet; their accoutrements or cross belts black leather, with pouches the same.

A battalion drawn out cannot but strike the spectators with a lively and fanciful military impression, as they unite in their exterior traits respectively Indian and European.

They are brought to the utmost exactness of discipline; go through their evolutions and manœuvres with a regularity and precision equal to, and not surpassed by, European troops. In action they are brave and steady, and have been known to stand where Europeans have given way.

Their discipline puts them on a footing with European troops, with whom they are always ready to act in concert.

Their utility and services are evident: they secure to the Company the internal good order and preservation of their territorial districts, which, though possible to be enforced with a strong hand by Europeans, requires numbers, and can only be conducted with that ease and address peculiar to the native forces of the country.

They are considered with respect in the eyes of the other natives, though they sufficiently, and with a good grace, feel and assert their own consequence. In large garrisons, where the duty is great, as Madras, Pondicherry, Trichinopoly, Vellore, &c. two or three battalions might be present together, exclusive of Europeans. If sent singly up the country, they are liable to be detached, sometimes by one or more companies being sent to a station dependent on the chief garrison or headquarters, otherwise they are dispersed through the districts, four or five together, with a non-commissioned officer (this is a part of the service which is called *going on command*), on hills, or in villages, to preserve order, convey intelligence, and assist the tasildar, renter, or cutwall of the place, in cases of emergency. They also enforce the police, and prevent in such cases the country from being infested with thieves, which otherwise have combined, forming a banditti, to rob passengers and plunder cattle, of which there are so many instances upon record. As for such British officers in the Company's service as are attached to battalions, they are obliged to follow the fortunes and destinations of their men, with their respective corps, leading a life often replete with adventures of a peculiar nature. An individual in such cases is frequently secluded from those of his own colour when up the country, or detached upon command, where in a frontier garrison or hill fort in the interior parts of India none but natives are to be found. Here he might live as he pleases, being perfectly absolute within his jurisdiction. Such stations being lucrative, with management may produce great fortunes. Neither is the condition hard to a person conversant in the language of the country, or that of the Seapoys called *Moors* (which most officers in the Company's service acquire); otherwise the loss of society is not recompensed by other advantages, as you forget your own language, grow melancholy, and pass your days without comfort.

The peace establishment at Madras consists of 30 Seapoy battalions, but in time of war is augmented as occasion requires; or frequently each corps is strengthened by the addition of two companies, which are reduced again in time of peace, the officers remaining supernumeraries in the service. In garrison they are quartered in barracks: they live agreeably to the usage of the country, sleep on the ground on a mat or thin carpet. In their persons they are cleanly, but appear to best advantage in their uniform. Off duty they go as the other natives in poor circumstances; and have only a cloth round their middle and over their shoulders. As to the different casts, the Moormen or Musselmen assert pre-eminence, as coming into the country by conquest. In their persons they are rather robust, and in their tempers vindictive. Their religion and dress is distinct from the Hindoos, who are mild and passive in their temper, faithful, steady, and good soldiers. The Pariars are inferior to the others, live under different circumstances, dwell in huts, and associate not on equal terms with the rest; they do all menial offices, are servants to Europeans, and think themselves happy when by them employed, though they are equally good Seapoys.

Having thus treated of the Company's Seapoys, we shall observe that they are kindly attentive to their officers when often in circumstances requiring their assistance; are guilty of few vices; and have a strong attachment for those who have commanded them. That acute historian Dr Robertson has remarked, as a proof that the ingenuity of man has recourse in similar situations to the same expedients, that the European powers have, in forming the establishment of these native troops, adopted the same maxims, and, probably without knowing it, have modelled their battalions of Seapoys upon the same principles as Alexander the Great did his phalanx of Persians.

Search-warrant. SEARCH-WARRANT, in law, a kind of general warrant issued by justices of peace or magistrates of towns for searching all suspected places for stolen goods. In Scotland this was often done formerly; and in some English law-books there are precedents requiring the constable to search all such suspected places as he and the party complaining shall think convenient; but such practice is condemned by Lord Hale, Mr Hawkins, and the best authorities both among the English and Scotch lawyers. However, in case of a complaint, and oath made of goods stolen, and that the party suspects that those goods are in a particular house, and shows the cause

cause of such suspicion, the justice may grant a warrant to search not only that house but other suspected places; and to attach the goods, and the party in whose custody they are found, and bring them before him or some other justice, to give an account how he came by them, and to abide such order as to law shall appertain; which warrant should be directed to the constable or other public officer, who may enter a suspected house and make search.

SEARCHER, an officer in the customs, whose business it is to search and examine ships outward bound, if they have any prohibited goods on board, &c. (12 Car. II.) There are also searchers of leather, &c. See ALNAGER.

SEARCHER, in ordnance, is an iron socket with branches, from four to eight in number, a little bent outwards, with small points at their ends; to this socket is fixed a wooden handle, from eight to twelve feet long, of about an inch and a quarter diameter. After the gun has been fired, this searcher is introduced into it, and turned round, in order to discover the cavities within. The distances of these cavities, if any be found, are then marked on the outside with chalk, when another searcher that has only one point, about which a mixture of wax and tallow is put, is introduced to take the impression of the holes; and if there be any hole, a quarter of an inch deep, or of any considerable length, the gun is rejected as unserviceable.

SEARCLOTH, or CERECLOTH, in surgery, a form of external remedy somewhat harder than an unguent, yet softer than an emplaster, though it is frequently used both for the one and the other. The cerecloth is always supposed to have wax in its composition, which distinguishes and even denominates it. In effect, when a liniment or unguent has wax enough in it, it does not differ from a cerecloth.

SEASIN, in a ship, the name of a rope by which the boat rides by the ship's side when in harbour, &c.

SEASONING, the first illness to which persons habituated to colder climates are subject on their arrival in the West Indies. This seasoning, unless they live very temperately, or are in a proper habit of body (tho' some people are unmolested for many months), seldom suffers them to remain long before it makes its appearance in some mode or other; particularly if at first they expose themselves in a shower of rain, or too long in the sun, or in the night air; or when the body is much heated, if they drink large draughts of cold liquors, or bathe in cold water; or use much exercise; or commit excess in drinking wine or spirits; or by heating the body and inflaming the blood; or by subjecting themselves to any cause that may suddenly check perspiration, which at first is generally excessive.

Some people, from a favourable state of body, have no seasoning. Thin people, and very young people, are most likely to escape it. Women generally do from their temperance, and perhaps their menstruation contributes to their security; indeed hot climates are favourable to the delicacy of their habits, and suitable to their modes of life. Some escape by great regularity of living; some, by the breaking out of the rash, called the *prickly heat*; some by a great degree of perspiration; and some by observing a cooling regimen. The disorders are various that constitute this seasoning of *new comers* as they are called; depending on age, constitution, and habit of body. But all seasoning diseases are of the inflammatory kind; and yield to antiphlogistic treatment proportioned to their violence. When all precaution to guard against sickness has failed, and prudence proved abortive to new comers, they will have this comfort at least for their pains, that their disorders will seldom be severe or expensive, and will generally have a speedy termination; and that their seasoning, as it is emphatically called, will be removed by bleeding, a dose of salts, rest, and a cooling regimen.

SEASONING of Timber. See TIMBER.

SEASONS, in cosmography, certain portions or quarters of the year, distinguished by the signs which the sun then enters, or by the meridian altitudes of the sun; consequent on which are different temperatures of the air, different works in tillage, &c. See WEATHER.

The year is divided into four seasons, spring, summer, autumn, and winter. The beginnings and endings of each whereof, see under its proper article. It is to be observed, the seasons anciently began differently from what they now do: witness the old verses,

Dat Clemens hyemem; dat Petrus ver cathedratus;
Æstuat Urbanus; autumnat Bartholomæus.

SEAT, in the manege, is the posture or situation of a horseman upon the saddle.

SEATON, a small fishing town on the south coast of Devon, between Lyme and Sidmouth. Risdon says "our learned antiquarians would have it to be that *Maridunum* whereof Antonine spake, placed between Dunnovaria and Isca; for *Maridunum* in British is the same with *Seaton* in English, 'a town upon a hill by the sea side." This place is memorable for the Danish princes landing there in the year 937.

SEBACIC ACID, the acid procured from fat. To obtain it, let some suet be melted in a skillet over the fire, along with some quicklime in fine powder, and constantly stirred, raising the fire towards the end of the operation, and taking care to avoid the vapours, which are very offensive. By this process the sebacic acid unites with the lime into a sebat of lime, which is difficultly soluble in water; it is, however, separated from the fatty matters with which it is mixed by solution in a large quantity of boiling water. From this the neutral salt is separated by evaporation; and, to render it pure, is calcined, redissolved, and again crystallized. After this we pour on a proper quantity of sulphuric acid, and the sebacic acid passes over by distillation. See FAT, and CHEMISTRY, *Index*.

St SEBASTIAN, a handsome, populous, and strong town of Spain, in the province of Guipuscoa, with a good and well frequented harbour. It is seated at the foot of a mountain; and the harbour secured by two moles, and a narrow entrance for the ships. The town is surrounded with a double wall, and to the sea-side is fortified with bastions and half moons. The streets are long, broad, and straight, and paved with white flagstones. At the top of the mountain is a citadel, with a garrison well furnished with cannon. The town carries on a considerable trade, the greatest part of which consists of iron and steel, which some reckon to be the best in Europe. They also deal in wool, which comes from

from Old Castile. W. Long. 1. 59. N. Lat. 43. 23.—The capital of Brasil in South America is likewise called *Sebastian*.

SEBASTIANO, called *Del Piombo*, from an office in the lead mines given him by Pope Clement VII. was an eminent Venetian painter, born in 1485. He was first a disciple of old Giovanni Bellino; continued his studies under Giorgione; and having attained an excellent manner of colouring, went to Rome, where he insinuated himself into the favour of Michael Angelo. He has the name of being the first who invented the art of preparing plaster-walls for oil-painting; but was so slow and lazy in his work, that other hands were often employed to finish what he began. He died in 1547.

SEBESTEN, in botany. See CORDIA.

SEBUÆI, a sect among the ancient Samaritans, whom St Epiphanius accused of changing the time expressed in the law, for the celebration of the great annual feast of the Jews.

SEBURAI, SEBURÆI, a name which the Jews give to such of their rabbins or doctors as lived and taught some time after the finishing of the Talmud.

SECACUL, in the materia medica of the ancients, a name given by Avicenna, Serapion, and others, to a root which was like ginger, and was brought from the East Indies, and used as a provocative to venery. The interpreters of their works have rendered this word *iringo*; and hence some have supposed that our *eryngium* or *eryngo* was the root meant by it: but this does not appear to be the case on a strict inquiry, and there is some reason to believe that the famous root, at this time called *ginseng*, was what they meant.

SECALE, RYE, in botany: A genus of the digynia order, belonging to the triandria class of plants; and in the natural method ranking under the 4th order, *Gramina*. The calyx is a glume of two leaves, which are opposite to one another, erect, linear, pointed, and less than the corolla. The corolla consists of two valves, the exterior of which ends in a beard. There are four species, the *villosum*, *orientale*, *creticum*, and *cereale*. The *villosum*, or wood rye-grass, is distinguished by a calyx with wedge-shaped scales, and by the fringe of the glume being woolly. The glumes of the *orientale* are shaggy, and the scales of the calyx shaped like an awl. The glumes of the *creticum* are fringed on the outside. The *cereale*, or common rye, has glumes with rough fringes. It is a native of the island of Candia, was introduced into England many ages ago, and is the only species of rye cultivated in this kingdom. There are, however, two varieties, the winter and spring rye.

The winter rye, which is larger in the grain than the spring rye, is sown in autumn at the same time with the wheat, and sometimes mixed with it; but as the rye ripens sooner than the wheat, this method must be very exceptionable. The spring rye is sown along with the oats, and usually ripens as soon as the winter rye; but the grain produced is lighter, and it is therefore seldom sown except where the autumnal crop has failed.

Rye is commonly sown on poor, dry, limestone, or sandy soils, where wheat will not thrive. By continuing to sow it on such a soil for two or three years, it will at length ripen a month earlier than that which has been raised for years on strong cold ground.

Rye is commonly used for bread either alone or mixed with wheat. This mixture is called *meslin*, and was formerly a very common crop in some parts of Britain. Mr Marshall tells us, that the farmers in Yorkshire believe that this mixed crop is never affected by mildew, and that a small quantity of rye sown among wheat will prevent this destructive disease. Rye is much used for bread in some parts of Sweden and Norway by the poor people. About a century ago rye-bread was also much used in England; but being made of a black kind of rye, it was of the same colour, clammy, very detergent, and consequently not so nourishing as wheat.

Rye is subject to a disease which the French call *ergot*, and the English *horned rye*; which sometimes happens when a very hot summer succeeds a rainy spring. According to Tissot, horned rye is such as suffers an irregular vegetation in the middle substance between the grain and the leaf, producing an excrescence of a brownish colour, about an inch and half long, and two-tenths of an inch broad. Bread made of this kind of rye has a nauseous acrid taste, and produces spasmodic and gangrenous disorders. In 1596 an epidemic disease prevailed in Hesse, which the physicians ascribed to bread made of horned rye. Some, we are told, were seized with an epilepsy, and these seldom ever recovered; others became lunatic, and continued stupid the rest of their lives: those who apparently recovered had annual returns of their disorder in January and February; and the disease was said to be contagious at least in a certain degree. The facts which we have now mentioned are taken from a work of Tissot, which was never printed. The same disease was occasioned by the use of this bread in several parts of the continent in the years 1648, 1675, 1702, 1716, 1722, and 1736; and has been very minutely described by Hoffman, A. O. Goelicke, Vater Burghart, and J. A. Srink.

In the year 1709, one fourth part of all the rye raised in the province of Salonia in France was horned, and the surgeon to the hospital of Orleans had no less than 500 patients under his care that were distempered by eating it: They were called *ergots*, from *ergot* (A), the French name for horned rye; they consisted chiefly of men and boys, the number of women and girls being very small. The first symptom was a kind of drunkenness, then the local disorder began in the toes, and thence extended sometimes to the thigh, and the trunk itself, even after amputation, which is a good argument against that operation before the gangrene is stopped.

In the year 1710, the celebrated Fontenelle describes a case in the History of the Academy of Sciences of France, which exactly resembles that of the poor family at Wattisham. A peasant at Blois, who had eaten horned rye in bread, was seized with a mortification, which first caused all the toes of one foot to fall off, then

(A) *Ergot* is French for a cock's spur, and horned rye was called *ergot* from the resemblance of its excrescence to that part.

 then the toes of the other, afterwards the remainder of the feet, and, lastly, it ate off the flesh of both his legs and thighs, leaving the bones bare.

Horned rye is not only hurtful to man, but to other animals; it has been known to destroy even the flies that settled upon it; sheep, dogs, deer, geese, ducks, swine, and poultry, that were fed with it for experiment, died miserably, some convulsed, others mortified and ulcerated.

SECANT, in geometry, a line that cuts another or divides it into parts. The secant of a circle is a line drawn from the circumference on one side to a point without the circumference on the other; and it is demonstrated by geometers, that of several secants drawn to the same point, that is the longest which passes through the centre of the circle. The portions, however, of these several secants that are without the circle are so much the greater as they recede from the centre, and the least external portion is of that secant which passes through it.

SECANT, in trigonometry, denotes a right line drawn from the centre of a circle, which, cutting the circumference, proceeds till it meets with a tangent to the same circle. See GEOMETRY, N° 24—28.

Line of SECANTS, one of those lines or scales which are usually put upon sectors. How such a scale is formed will be seen by a bare inspection of fig. 53. Plate CCXV.; for C 10, C 20, C 30, &c. drawn from the centre C to the line of tangents BE, being the real secants of the arches B 10, B 20, B 30, it is obvious that by marking off the distances B 10, B 20, B 30, upon any other line, we make that line a scale of secants.

1 Seceders. SECEDERS, a numerous body of Presbyterians in Scotland, who have withdrawn from the communion of the established church. As they take up their ground upon the establishment of religion from 1638 to 1650, which they hold to be the purest period of the Scottish church, we shall introduce our account of them by a short review of ecclesiastical history from that period to the era of their secession. With our usual candour and impartiality we mean to give a fair statement of those events with which, as they say, their secession is connected.

James I. having for some time previous to his death entertained a wish to form the church of Scotland as much as possible upon the model of that in England, his son Charles, with the assistance of Archbishop Laud, endeavoured to carry the design into execution, by establishing canons for ecclesiastical discipline, and introducing a liturgy into the public service of the church.—Numbers of the clergy and laity of all ranks took the alarm at what they considered to be a bold and dangerous innovation; and after frequent applications to the throne, they at last obtained the royal proclamation for a free parliament and general assembly. The assembly met in 1638, and began their labours with a repeal of all the acts of the six preceding parliaments, which had favoured the designs of James. They condemned the liturgy, together with every branch of the hierarchy. They cited all the Scottish bishops to their bar; and after having excommunicated nine of them, and deposed five from their episcopal office, they restored kirk-sessions, presbyteries, and synods provincial as well as national. See PRESBYTERIANS.

These proceedings were ratified by the parliament which met in 1640. The law of patronage was in full force for several years after this period; yet great care was taken that no minister should be obtruded on the Christian people contrary to their inclinations; and in 1649 it was abolished as an oppressive grievance.

The Restoration of Charles II. in 1660 changed the face of affairs in the church of Scotland. All that the general assembly had done from 1638 to 1650 was rendered null and void, their covenants were pronounced to be unlawful, episcopacy was restored, and the king was declared to be the supreme head of the church in all causes civil and ecclesiastical. During this period the Presbyterians were subjected to fines and imprisonment, while numbers of them were publicly executed for their adherence to their political and religious tenets.

The Revolution in 1688 gave a different turn to the affairs of the church. The first parliament which met after that event, abolished prelacy and the king's supremacy in ecclesiastical affairs. They ratified the Westminster Confession of Faith, together with the Presbyterian form of church-government and discipline, "as agreeable to the word of God, and most conducive to the advancement of true piety and godliness, and the establishment of peace and tranquillity within these realms." That same parliament abolished patronage, and lodged the election of ministers in the hands of heritors and elders, with the consent of the congregation.

In the reign of Q. Anne the true Protestant religion was ratified and established, together with the Presbyterian form of church-government and discipline; and the unalterable continuance of both was declared to be an essential condition of the union of the two kingdoms in all time coming. In 1712 the law respecting patronage was revived, in resentment, it has been said, of that warm attachment which the church of Scotland discovered to the family of Hanover; but the severity of that law was greatly mitigated by the first parliament of George I. stat. 50. by which it is enacted, that if the presentee do not signify his acceptance, the presentation shall become void and null in law. The church, however, did not avail herself of this statute; and an event which happened not many years afterwards gave rise to the *secession*.

In 1732 more than 40 ministers presented an address to the general assembly, specifying in a variety of instances what they considered to be great defections from the established constitution of the church, and craving a redress of these grievances. A petition to the same effect, subscribed by several hundreds of elders and private Christians, was offered at the same time; but the assembly refused a hearing to both, and enacted, that the election of ministers to vacant charges, where an accepted presentation did not take place, should be competent only to a conjunct meeting of elders and heritors, being Protestants. To this act many objections were made by numbers of ministers and private Christians. They asserted that more than 30 to one in every parish were not possessed of landed property, and were on that account deprived of what they deemed their natural right to choose their own pastors. It was also said, that this act was extremely prejudical to the honour and interest of the church, as well as to the edification of the people; and in fine, that it was directly 2 Origin of.

contrary to the appointment of Jesus Christ, and the practice of the apostles, when they filled up the first vacancy in the apostolic college, and appointed the election of deacons and elders in the primitive church.—Many of those also who were thought to be the best friends of the church, expressed their fears that this act would have a tendency to overturn the ecclesiastical constitution which was established at the Revolution.

3
They oppose the measures of the general assembly;

Mr Ebenezer Erskine minister at Stirling distinguished himself by a bold and determined opposition to the measures of the assembly in 1732. Being at that time moderator of the synod of Perth and Stirling, he opened the meeting at Perth with a sermon from Psalm cxviii. 22. "The stone which the builders rejected is become the head stone of the corner." In the course of his sermon he remonstrated with no small degree of freedom against the act of the preceding assembly with regard to the settlement of ministers, and alleged that it was contrary to the word of God and the established constitution of the church. A formal complaint was lodged against him for uttering several offensive expressions in his sermon before the synod. Many of the members declared that they heard him utter nothing but sound and reasonable doctrine; but his accusers insisting on their complaint, obtained an appointment of a committee of synod to collect what were called the offensive expressions, and to lay them before the next diet in writing. This was done accordingly; and Mr Erskine gave in his answers to every article of the complaint. After three days warm reasoning on

4
for which their ministers are censured.

this affair, the synod by a majority of six found him censurable; against which sentence he protested, and appealed to the next general assembly. When the assembly met in May 1733, it affirmed the sentence of the synod, and appointed Mr Erskine to be rebuked and admonished from the chair. Upon which he protested, that, as the assembly had found him censurable, and had rebuked him for doing what he conceived to be agreeable to the word of God and the standards of the church, he should be at liberty to preach the same truths, and to testify against the same or similar evils, on every proper occasion. To this protest Messrs William Wilson minister at Perth, Alexander Muncrief minister at Abernethy, and James Fisher minister at Kinclaven, gave in a written adherence, under the form of instrument; and these four withdrew, intending to return to their respective charges, and act agreeably to their protest whenever they should have an opportunity. Had the affair rested here, there never would have been a secession; but the assembly resolving to carry on the process, cited them by their officer to compear next day. They obeyed the citation; and a committee was appointed to retire with them, in order to persuade them to withdraw their protest. The committee having reported that they still adhered to their protest, the assembly ordered them to appear before the commission in August following and retract their protest; and if they should not comply and testify their sorrow for their conduct, the commission was empowered to suspend them from the exercise of their ministry, with certification that if they should act contrary to said sentence, the commission should proceed to a higher censure.

The commission met in August accordingly; and the four ministers still adhering to their protests, were suspended from the exercise of their office, and cited to the next meeting of the commission in November following. From this sentence several ministers and elders, members of the commission, dissented. The commission met in November, and the suspended ministers compeared. Addresses, representations, and letters from several synods and presbyteries, relative to the business now before the commission, were received and read. The synods of Dumfries, Murray, Ross, Angus and Mearns, Perth and Stirling, craved that the commission would delay proceeding to a higher censure. The synods of Galloway and Fife, as also the presbytery of Dornoch, addressed the commission for lenity, tenderness, and forbearance, towards the suspended ministers; and the presbytery of Aberdeen represented, that, in their judgment, the sentence of suspension inflicted on the foresaid ministers was too high, and that it was a stretch of ecclesiastical authority. Many members of the commission reasoned in the same manner, and alleged that the act and sentence of last assembly did not oblige them to proceed to a higher censure at this meeting of the commission. The question, however, was put, Proceed to an higher censure, or not? and the votes being numbered, were found equal on both sides: upon which Mr John Goldie the moderator gave his casting vote to proceed to an higher censure; which stands in their minutes in these words: "The commission did and hereby do loose the relation of Mr Ebenezer Erskine minister at Stirling, Mr William Wilson minister at Perth, Mr Alexander Moncrief minister at Abernethy, and Mr James Fisher minister at Kinclaven, to their respective charges, and declare them no longer ministers of this church; and do hereby prohibit all ministers of this church to employ them, or any of them, in any ministerial function. And the commission do declare the churches of the said ministers vacant from and after the date of this sentence.

5
Suspended from the exercise of their office.

6
Deprived of their livings.

This sentence being intimated to them, they protested, that their ministerial office and relation to their respective charges should be held *as* valid as if no such sentence had passed; and that they were now obliged to make a *secession* from the prevailing party in the ecclesiastical courts; and that it shall be lawful and warrantable for them to preach the gospel, and discharge every branch of the pastoral office, according to the word of God and the established principles of the church of Scotland. Mr Ralph Erskine minister at Dunfermline, Mr Thomas Mair minister at Orwel, Mr John M'Laren minister at Edinburgh, Mr John Currie minister at Kinglassie, Mr James Wardlaw minister at Dunfermline, and Mr Thomas Nairn minister at Abbotshal, protested against the sentence of the commission, and that it should be lawful for them to complain of it to any subsequent general assembly of the church.

The secession properly commenced at this date. And accordingly the ejected ministers declared in their protest that they were laid under the disagreeable necessity of seceding, not from the principles and constitution of the church of Scotland, to which, they said, they stedfastly adhered, but from the present church courts, which had thrown them out from ministerial communion. The assembly, however, which met in May 1734 did so far modify the above sentence, that they empowered the synod of Perth and Stirling to receive the ejected minister

ders. miniſters into the communion of the church, and reſtore them to their reſpective charges; but with this expreſs direction, "that the ſaid ſynod ſhould not take upon them to judge of the legality or formality of the former procedure of the church judicatories in relation to this affair, or either approve or cenſure the ſame." As this appointment neither condemned the act of the preceding aſſembly nor the conduct of the commiſſion, the ſeceding miniſters conſidered it to be rather an act of grace than of juſtice, and therefore they ſaid they could not return to the church-courts upon this ground; and they publiſhed to the world the reaſons of their refuſal, and the terms upon which they were willing to return to the communion of the eſtabliſhed church. They now erected themſelves into an eccleſiaſtical court, which they called the *Aſſociated Preſbytery*, and preached occaſionally to numbers of the people who joined them in different parts of the country. They alſo publiſhed what they called an *Act, Declaration, and Teſtimony* to the doctrine, worſhip, government, and diſcipline of the church of Scotland, and againſt ſeveral inſtances, as they ſaid, of defection from theſe, both in former and in the preſent times. Some time after this ſeveral miniſters of the eſtabliſhed church joined them, and the Aſſociated Preſbytery now conſiſted of eight miniſters. But the general aſſembly which met in 1738 finding that the number of Seceders was much increaſed, ordered the eight miniſters to be ſerved with a libel, and to be cited to the next meeting of the aſſembly in 1739. They now appeared at the bar as a conſtituted preſbytery, and having formally declined the aſſembly's authority, they immediately withdrew. The aſſembly which met next year depoſed them from the office of the miniſtry;

7 which, however, they continued to exerciſe in their
de- reſpective congregations, who ſtill adhered to them,
ed. and erected meeting-houſes, where they preached till their death. Mr James Fiſher, the laſt ſurvivor of them, was, by an unanimous call in 1741, tranſlated from Kinclaven to Glaſgow, where he continued in the exerciſe of his miniſtry among a numerous congregation, reſpected by all ranks in that large city, and died in 1775 much regretted by his people and friends. In 1745 the ſeceding miniſters were become ſo numerous, that they were erected into three different preſbyteries, under one ſynod, when a very unprofitable diſpute divided them into two parties.

The burgeſs oath in ſome of the royal boroughs of Scotland contains the following clauſe: "I profeſs and allow with my heart the true religion preſently profeſſed within this realm, and authorized by the laws

8 thereof. I will abide at and defend the ſame to my
y di- life's end, renouncing the Romiſh religion called *Pa-*
among *piſtry*." Meſſrs Ebenezer and Ralph Erſkine, James
nſelves Fiſher, and others, affirmed that this clauſe was no way
at the contrary to the principles upon which the ſeceſſion was
lity of formed, and that therefore every Seceder might lawfully
burgeſs ſwear it. Meſſrs Alexander Moncrief, Thomas Mair,
; Adam Gib, and others, contended on the other hand that the ſwearing of the above clauſe was a virtual renunciation of their teſtimony. And this controverſy was ſo keenly agitated, that they ſplit into two different parties, and now meet in different ſynods. Thoſe of them who aſſert the lawfulneſs of ſwearing the burgeſs oath are called *Burghers*, and the other party who condemn it are called *Antiburgher Seceders*. Each party claiming to itſelf the lawful conſtitution of the *Aſſociate Synod*, the Antiburghers, after ſeveral previous ſteps, excommunicated the Burghers on the ground of their 9
ſin and of their contumacy in it. This rupture took and form
place in 1747, ſince which period no attempts to effect ſeparate
a reunion have been ſucceſsful. They remain under the communi-
juriſdiction of different ſynods, and hold ſeparate com- ons.
munion, although much of their former hoſtility has been laid aſide. The Antiburghers conſider the Burghers as too lax and not ſufficiently ſtedfaſt to their teſtimony. The Burghers on the other hand contend that the Antiburghers are too rigid, in that they have introduced new terms of communion into the ſociety. The Antiburghers having adopted ideas with regard to what they call *covenanting*, which the Burghers never approved (A), have been in uſe of renewing in their ſeveral congregations the Scottiſh Covenant, by cauſing their people formally ſwear to maintain it. In other reſpects the differences between the two parties are not material. The Antiburghers are moſt numerous on the north of the Tay, and the Burghers on the ſouth of it. 10

What follows in this article is a further account of History of
thoſe who are commonly called the *Burgher Seceders*. the Burgh-
Theſe have a greater number of people in their com- er Seceders.
munion than the Antiburghers, and for ſome years paſt they have greatly increaſed in the ſouthern and weſtern diſtricts of Scotland. As there were among them from the commencement of their ſeceſſion ſeveral ſtudents who had been educated at one or other of the univerſities, they appointed one of their miniſters to give lectures in theology, and train up candidates for the miniſtry. Meſſrs William Wilſon miniſter at Perth and Alexander Moncrief miniſter at Abernethy were their profeſſors of theology before their ſeparation from the Antiburghers.

Since that period Mr Ebenezer Erſkine miniſter at Stirling, Mr James Fiſher miniſter at Glaſgow, Mr John Swanſton miniſter at Kinroſs, and Mr John Brown miniſter at Haddington, have ſucceeded each other in this office. At preſent (1794) Mr George Lawſon miniſter at Selkirk is their profeſſor of theology, and there are between thirty and forty ſtudents who attend his lectures annually. The number of their miniſters is about a hundred, and each of their congregations contains from two hundred and fifty to three thouſand perſons; and there are among them at preſent more than twenty vacant charges. Where a congregation is very numerous, as in Stirling, Dunfermline, and Perth, it is formed into a collegiate charge, and provided with two miniſters. They are erected into ſix different

(A) This is the account which the Burghers give of their own notions reſpecting the covenant. One of the moſt enlightened of their opponents, however, aſſures us that they acknowledge covenanting to be a *moral duty*, and that the ſolemn vows of our anceſtors are obligatory. But ſince the breach in the ſynod they have never engaged in this work; giving, as their reaſon, that this is not the proper ſeaſon.

ferent prefbyteries, united in one general fynod, which commonly meets at Edinburgh in May and September (B). They have alfo a fynod in Ireland compofed of three or four different prefbyteries. They are legally tolerated in Ireland; and government fome years ago granted 500l. per annum, and of late an additional 500l. which, when divided among them, affords to each minifter about 20l. over and above the ftipend which he receives from his hearers. Thefe have befides a prefbytery in Nova Scotia; and fome years ago, it is faid, that the Burgher and the Antiburgher minifters refiding in the United States formed a coalition, and joined in a general fynod, which they call the *Synod* of *New York* and *Pennfylvania*. They all preach the doctrines contained in the Weftminfter Confeffion of Faith and Catechifms, as they believe thefe to be founded on the facred Scriptures. They catechife their hearers publicly, and vifit them from houfe to houfe once every year. They will not give the Lord's fupper to thofe who are ignorant of the principles of the gofpel, nor to fuch as are fcandalous and immoral in their lives. They condemn private baptifm, nor will they admit thofe who are grofsly ignorant and profane to be fponfors for their children. Believing that the people have a natural right to choofe their own paftors, the fettlement of their minifters always proceeds upon a popular election; and the candidate who is elected by the majority is ordained among them. Convinced that the charge of fouls is a truft of the greateft importance, they carefully watch over the morals of their ftudents, and direct them to fuch a courfe of reading and ftudy as they judge moft proper to qualify them for the profitable difcharge of the paftoral duties. At the ordination of their minifters they ufe a *formula* of the fame kind with that of the eftablifhed church, which their minifters are bound to fubfcribe when called to it; and if any of them teach doctrines contrary to the Scriptures or the Weftminfter Confeffion of Faith, they are fure of being thrown out of their communion. By this means uniformity of fentiment is preferved among them; nor has any of their minifters, excepting one, been profecuted for error in doctrine fince the commencement of their feceffion.

11 Their rules of faith,

They believe that the holy Scriptures are the fole criterion of truth, and the only rule to direct mankind to glorify and enjoy God, the chief and eternal good; and that "the Supreme Judge, by which all controverfies of religion are to be determined, and all the decrees of councils, opinions of ancient writers, doctrines of men and private fpirits, are to be examined, and in whofe fentence we are to reft, can be no other but the Holy Spirit fpeaking in the Scriptures." They are fully perfuaded, however, that the ftandards of public authority in the church of Scotland exhibit a juft and confiftent view of the meaning and defign of the holy Scriptures with regard to doctrine, worfhip, government, and difcipline; and they fo far differ from the diffenters in England, in that they hold thefe ftandards to be not only articles of peace and a teft of orthodoxy, but as a bond of union and fellowfhip. They confider a fimple declaration of adherence to the Scriptures as too equivocal a proof of unity in fentiment, becaufe Arians, Socinians, and Arminians, make fuch a confeffion of their faith, while they retain fentiments which they (the Seceders) apprehend are fubverfive of the great doctrines of the gofpel. They believe that Jefus Chrift is the only King and Head of the Church, which is his body; that it is his fole prerogative to enact laws for the government of his kingdom, which is not of this world; and that the church is not poffeffed of a legiflative, but only of an executive power, to be exercifed in explaining and applying to their proper objects and ends thofe laws which Chrift hath publifhed in the Scriptures. Thofe doctrines which they teach relative to faith and practice are exhibited at great length in an explanation of the Weftminfter Affembly's Shorter Catechifm, by way of queftion and anfwer, in two volumes, compofed chiefly by Mr James Fifher late of Glafgow, and publifhed by defire of their fynod.

For thefe fifty years paft, the grounds of their feceffion, they allege, have been greatly enlarged by the public adminiftrations of the eftablifhed church, and particularly by the uniform execution of the law refpecting patronage, which, they fay, has obliged many thoufands of private Chriftians to withdraw from the parifh-churches and join their fociety.

It is certain, however, that their number has rapidly increafed of late, efpecially in the large cities of the kingdom. They have three different congregations in Edinburgh, two in Glafgow, and two in London, befides feveral others in the north of England. In moft of their congregations they celebrate the Lord's fupper twice in the year, and they catechife their young people concerning their knowledge of the principles of religion previoufly to their admiffion to that facrament. When any of them fall into the fin of fornication or adultery, the fcandal is regularly purged according to the form of procefs in the eftablifhed church; and thofe of the delinquents who do not fubmit to adequate cenfure are publicly declared to be fugitives from difcipline, and are expelled the fociety. They never accept a fum of money as a commutation for the offence. They condemn all clandeftine and irregular marriages, nor will they marry any perfons unlefs they have been proclaimed in the parifh-church on two different Lord's days at leaft.

When they feparated from the eftablifhed church, and they remained firm in their attachment to the ftate; and they 12 Their political principles.

(B) The conftitution of the Antiburgher church differs very little from that of the Burghers. The fupreme court among them is defigned *The General Affociate Synod*, having under its jurifdiction three provincial fynods in Scotland and one in Ireland. In the former country there are eleven prefbyteries; in the latter, four. They have a few congregations in England, and a prefbytery in connexion with them in North America. The number of minifters belonging to the general fynod is a hundred and thirty feven; and in Scotland there are nineteen vacancies. They, as well as the Burgher Seceders, have a profeffor of theology, whofe lectures every candidate for the office of a preacher is obliged to attend, we have been told, for no lefs than five or fix feffions! Surely the feffion muft be of fhort duration.

they were not many years formed into a distinct society, when they expelled from their communion a Mr Thomas Nairn minister at Kirkealdy, who had taught doctrines inimical to the civil government of the nation. In 1745 there was not one of their number who joined the then pretender to the British crown. They are still of the same sentiments; and in their public assemblies they always pray for our sovereign King George, with the royal family, and for all who are in authority under them. They are so far from wishing the overthrow of the present civil government, that when the nation was lately in danger of being thrown into a fermentation by the circulation of inflammatory and seditious writings, they warmly recommended peace and order in society (c). No legal disqualifications, as in the case of the dissenters in England, exclude them from any place of public trust in the municipal government of the country; and some of them are frequently in the magistracy of the royal boroughs. They are not, however, legally tolerated, but are supported by the mildness of administration and the liberal spirit of the times. Avowing their adherence to the doctrines contained in the public standards of the church of Scotland, together with the Presbyterian form of government, from which they never intended to secede, they deny that they are either schismatics or sectaries, as they have been frequently called: and when they withdrew from the ecclesiastical courts, they did not, they say, constitute a church of their own, different from the national church, but profess to be a part of that church, endeavouring to hold by her reformed principles, in opposition to those deviations from them which they have specified in their *Act and Testimony*. Most of them live in habits of friendship and intimacy with their brethren of the establishment, and they profess an affectionate regard for all those of every denomination who love Jesus Christ in sincerity and truth. In the late re-exhibition of their testimony, they have declared to the world, that, were the grounds of their secession happily removed, they would account it one of the most singular felicities of their time to return with pleasure to the communion of the established church.

SECHIUM, in botany: A genus of the syngenesia order, belonging to the monœcia class of plants; and in the natural method ranking under the 34th order, *Cucurbitaceæ*. The male calyx is quinquedentate and monophyllous; the corolla monopetalous; the five filaments are united in an erect tube. In the female flower the pistillum is cylindrical and erect; the stigma large, peltated, and reflected: the pericarpium large, oval, unequal, fleshy, and unilocular, containing one seed, which is smooth, compressed, and fleshy. Of this there is only one species, viz. the *Edulis*, or Chocho vine.—This is cultivated and grows very luxuriantly in many places in Jamaica. The vines run and spread very much. The fruit is boiled, and served up at table by way of greens; and the root of the old vine is somewhat like a yam (*Dioscorea*), and on being boiled or roasted tastes farinaceous and wholesome.

SECKENDORF (Guy Lewis de), a very learned German, descended from an ancient and noble family, was born at Aurach in Franconia in 1626. He was a good linguist, learned in law, history, and divinity; and is said to have been a tolerable painter and engraver. He was honourably employed by several of the German princes; and died counsellor of state to Frederic III. elector of Brandenburg, and chancellor of the university of Halle, in 1692. He wrote many books, particularly "A history and defence of the Lutheran religion," 2 vols. folio, Frankfort, 1602, in Latin.

SECKER (Thomas), a learned and respectable prelate of the church of England, was born, in 1693, at a village called *Sibthorp*, in the vale of Belvoir, Nottinghamshire. His father was a Protestant dissenter, a pious, virtuous, and sensible man; who having a small paternal fortune, followed no profession. His mother was the daughter of Mr George Brough, a substantial gentleman farmer of Shelton in the same county. He received his education at several private schools and academies in the country, being obliged, by various accidents, to change his masters frequently.

Notwithstanding this disadvantage, he had at the age of 19 not only made a considerable progress in Greek and Latin, and read the best writers in both languages, but had acquired a knowledge of French, Hebrew, Chaldee, and Syriac; had learned geography, logic, algebra, geometry, conic sections, and gone through a course of lectures on Jewish antiquities and other points, preparatory to the critical study of the Bible. He had been destined by his father for orders among the Dissenters. With this view, during the latter years of his education, his studies were chiefly turned towards divinity, in which he had made such quick advances, that by the time he was 23 he had carefully read over a great part of the Scriptures, particularly the New Testament, in the original, and the best comments upon it; Eusebius's Ecclesiastical History, The Apostolical Fathers, Whiston's Primitive Christianity, and the principal writers for and against Ministerial and Lay Conformity.—But though the result of these inquiries was a well-grounded belief of the Christian revelation, yet not being at that time able to decide on some abstruse speculative doctrines, nor to determine absolutely what communion he should embrace; he resolved, like a wise and honest man, to pursue some profession, which should leave him at liberty to weigh those things more maturely in his thoughts, and not oblige him to declare or teach publicly opinions which were not yet thoroughly settled in his own mind.

In 1716, therefore, he applied himself to the study of physic, and after gaining all the medical knowledge he could,

(c) All this is said of the Burgher Seceders; but we hope it is equally true of those who are styled Antiburghers. There are indeed some clauses in the Covenant, which they swear to maintain, that seem not, at first view, very friendly to civil subordination; but let not those who entertain any apprehension on this account, forget that one of the most useful defences of the British constitution, occasioned by the late factious spirit of democratic innovation, came from the pen of Dr Young the Antiburgher minister at Hawick. See *Young's Essays*.

could, by reading the uſual preparatory books, and attending the beſt lectures during that and the following winter in London, in order to improve himſelf farther, in January 1718-19 he went to Paris. There he lodged in the ſame houſe with the famous anatomiſt Mr Winſlow, whoſe lectures he attended, as he did thoſe of the materia medica, chemiſtry, and botany, at the king's gardens. The operations of ſurgery he ſaw at the *Hotel Dieu*, and attended alſo for ſome time M. Gregoire, the accoucheur, but without any deſign of ever practiſing that or any other branch of ſurgery. Here he became acquainted with Mr Martin Benſon, afterwards biſhop of Glouceſter, one of the moſt agreeable and virtuous men of his time; with whom he quickly became much connected, and not many years after was united to him by the ſtricteſt bonds of affinity as well as affection.

During the whole of Mr Secker's continuance at Paris, he kept up a conſtant correſpondence with Mr Joſeph Butler, afterwards biſhop of Durham, with whom he became acquainted at the academy of one Mr Jones, kept firſt at Glouceſter, and afterward at Tewkſbury. Mr Butler having been appointed preacher at the Rulls on the recommendation of Dr Clarke and Mr Edward Talbot, ſon to Biſhop Talbot, he now took occaſion to mention his friend Mr Secker, without Secker's knowledge, to Mr Talbot, who promiſed, in caſe he choſe to take orders in the church of England, to engage the biſhop his father to provide for him. This was communicated to Mr Secker in a letter from Mr Butler about the beginning of May 1720. He had not at that time come to any reſolution of quitting the ſtudy of phyſic; but he began to foreſee many obſtacles to his purſuing that profeſſion; and having never diſcontinued his application to theology, his former difficulties both with regard to conformity and ſome other doubtful points had gradually leſſened, as his judgment became ſtronger, and his reading and knowledge more extenſive. It appears alſo from two of his letters ſtill in being, written from Paris to a friend in England, (both of them prior to the date of Mr Butler's abovementioned), that he was greatly diſſatisfied with the diviſions and diſturbances which at that particular period prevailed among the Diſſenters.

In this ſtate of mind Mr Butler's unexpected propoſal found him; which he was therefore very well diſpoſed to take into conſideration; and after deliberating on the ſubject of ſuch a change for upwards of two months, he reſolved at length to embrace the offer, and for that purpoſe quitted France about the beginning of Auguſt 1720.

On his arrival in England, he was introduced to Mr Talbot, with whom he cultivated a cloſe acquaintance; but it was unfortunately of very ſhort duration; for in the month of December that gentleman died of the ſmallpox. This was a great ſhook to all his friends, who had juſtly conceived the higheſt expectations of him; but eſpecially to an amiable lady whom he had lately married, and who was very near ſinking under ſo ſudden and grievous a ſtroke. Mr Secker, beſide ſharing largely in the common grief, had peculiar reaſon to lament an accident that ſeemed to put an end to all his hopes: but he had taken his reſolution, and he determined to perſevere. It was ſome encouragement to him to find that Mr Talbot had, on his deathbed, recommended him, together with Mr Benſon and Mr Butler, to his father's notice. Thus did that excellent young man (for he was but 29 when he died), by his nice diſcernment of characters, and his conſiderate good nature, provide moſt effectually, in a few ſolemn moments, for the welfare of that church from which he himſelf was ſo prematurely ſnatched away; and at the ſame time raiſed up, when he leaſt thought of it, the trueſt friend and protector to his wife and unborn daughter; who afterwards found in Mr Secker all that tender care and aſſiſtance which they could have hoped for from the neareſt relation. Secker.

It being judged neceſſary by Mr Secker's friends that he ſhould have a degree at Oxford; and having been informed, that if he ſhould previouſly take the degree of Doctor in Phyſic at Leyden, it would probably help him in obtaining the other, he went over and took his degree there in March 1721: and, as part of his exerciſe for it, he compoſed and printed a diſſertation *de Medicina Statica*, which is ſtill extant, and is thought by the gentlemen of that profeſſion to be a ſenſible and learned performance.

In April the ſame year, he entered himſelf a gentleman commoner of Exeter college, Oxford; after which he obtained the degree of Bachelor of Arts, in conſequence of the chancellor's recommendatory letter to the convocation.

He now ſpent a conſiderable part of his time in London, where he quickly gained the eſteem of ſome of the moſt learned and ingenious men of thoſe days, particularly of Dr Clarke, rector of St James's, and the celebrated Dean Berkeley, afterwards Biſhop of Cloyne, with whom he every day became more delighted, and more cloſely connected. He paid frequent viſits of gratitude and friendſhip to Mrs Talbot, widow of Mr Edward Talbot, by whom ſhe had a daughter five months after his deceaſe. With her lived Mrs Catharine Benſon, ſiſter to Biſhop Benſon, whom in many reſpects ſhe greatly reſembled. She had been for ſeveral years Mrs Talbot's inſeparable companion, and was of unſpeakable ſervice to her at the time of her huſband's death, by exerting all her courage, activity, and good ſenſe (of which ſhe poſſeſſed a large ſhare), to ſupport her friend under ſo great an affliction, and by afterwards attending her ſickly infant with the utmoſt care and tenderneſs, to which, under Providence, was owing the preſervation of a very valuable life.

Biſhop Talbot being in 1721 appointed to the ſee of Durham, Mr Secker was in 1722 ordained deacon by him in St James's church, and prieſt not long after in the ſame place, where he preached his firſt ſermon, March 28. 1723. The biſhop's domeſtic chaplain at that time was Dr Rundle, a man of warm fancy and very brilliant converſation, but apt ſometimes to be carried by the vivacity of his wit into indiſcreet and ludicrous expreſſions, which created him enemies, and, on one occaſion, produced diſagreeable conſequences.—With him Mr Secker was ſoon after aſſociated in the biſhop's family, and both taken down by his lordſhip to Durham in July 1723.

In the following year the biſhop gave Mr Secker the rectory of Houghton-le-Spring. This preferment putting it in his power to fix himſelf in the world, in a manner agreeable to his inclinations, he ſoon after made a propoſal of marriage to Mrs Benſon; which being accepted,

cepted, they were married by Bishop Talbot in 1725. At the earnest request of both, Mrs Talbot and her daughter consented to live with them, and the two families from that time became one.

About this time Bishop Talbot also gave preferments to Mr Butler and Mr Benson, whose rise and progress in the church is here interwoven with the history of Mr Secker. In the winter of 1725-6, Mr Butler first published his incomparable sermons; on which, as Dr Beilby Porteous and Dr Stinton informs us, Mr Secker took pains to render the style more familiar, and the author's meaning more obvious: yet they were at last by many called obscure. Mr Secker gave his friend the same assistance in that noble work the Analogy of Religion, &c.

He now gave up all the time he possibly could to his residence at Houghton, applying himself with alacrity to all the duties of a country clergyman, and supporting that useful and respectable character throughout with the strictest propriety. He omitted nothing which he thought would be of use to the souls and bodies of the people intrusted to his care. He brought down his conversation and his sermons to the level of their understandings; he visited them in private, he catechised the young and ignorant, he received his country neighbours and tenants very kindly and hospitably, and was of great service to the poorer sort of them by his skill in physic, which was the only use he ever made of it. Though this place was in a very remote part of the world, yet the solitude of it perfectly suited his studious disposition, and the income arising from it bounded his ambition. Here he would have been content to live and die; here, as he has often been heard to declare, he spent some of the happiest hours of his life; and it was no thought or choice of his own that removed him to a higher and more public sphere; but Mrs Secker's health, which now began to be very bad, and was thought to be injured by the dampness of the situation, obliged him to think of exchanging it for a more healthy one. Accordingly, an exchange was made through the friendly interposition of Mr Benson (who generously sacrificed his own interest on this occasion, by relinquishing a prebend of his own to serve his friend) with Dr Finney, prebendary of Durham, and rector of Ryton; and Mr Secker was instituted to Ryton and the prebend June 3. 1727. For the two following years he lived chiefly at Durham, going every week to officiate at Ryton, and spending there two or three months together in the summer.

In July 1732 he was appointed chaplain to the king; for which favour he was indebted to Dr Sherlock, who having heard him preach at Bath, had conceived the highest opinion of his abilities, and thought them well worthy of being brought forward into public notice. From that time an intimacy commenced between them, and he received from that great prelate many solid proofs of esteem and friendship.

His month of waiting at St James's happened to be August, and on Sunday the 27th of that month he preached before the queen, the king being then abroad. A few days after, her majesty sent for him into her closet, and held a long and gracious conversation with him; in the course of which he took an opportunity of mentioning to her his friend Mr Butler. He also not long after this, on Mr Talbot's being made lord chancellor, found means to have Mr Butler effectually recommended to him for his chaplain. The queen also appointed him clerk of her closet; from whence he rose, as his talents became more known, to those high dignities which he afterwards attained.

Mr Secker now began to have a public character, and stood high in the estimation of those who were allowed to be the best judges of merit: he had already given proofs of abilities that plainly indicated the eminence to which he must one day rise, as a preacher and a divine; and it was not long before an opportunity offered of placing him in an advantageous point of view. Dr Tyrrwhit, who succeeded Dr Clarke as rector of St James's in 1729, found that preaching in so large a church endangered his health. Bishop Gibson, therefore, his father-in-law, proposed to the crown that he should be made residentiary of St Paul's, and that Mr Secker should succeed him in the rectory. This arrangement was so acceptable to those in power, that it took place without any difficulty. Mr Secker was instituted rector the 18th of May 1733; and in the beginning of July went to Oxford to take his degree of Doctor of Laws, not being of sufficient standing for that of divinity. On this occasion it was that he preached his celebrated Act Sermon, on the advantages and duties of academical education, which was universally allowed to be a masterpiece of sound reasoning and just composition: it was printed at the desire of the heads of houses, and quickly passed through several editions. It is now to be found in the second collection of Occasional Sermons, published by himself in 1766.

It was thought that the reputation he acquired by this sermon, contributed not a little toward that promotion which very soon followed its publication. For in December 1734, he received a very unexpected notice from Bishop Gibson, that the king had fixed on him to be bishop of Bristol. Dr Benson was about the same time appointed to the see of Gloucester, as was Dr Fleming to that of Carlisle; and the three new bishops were all consecrated together in Lambeth Chapel, Jan. 19. 1734-5, the consecration-sermon being preached by Dr Thomas, afterwards bishop of Winchester.

The honours to which Dr Secker was thus raised in the prime of life did not in the least abate his diligence and attention to business; for which, indeed, there was now more occasion than ever. His learned biographers, Messrs Porteous and Stinton, now relate the manner in which he set about the visitation of his diocese, and the ceremony of confirmation, which he performed in a great number of places; he also preached in several churches, sometimes twice a-day. The affairs of his parish of St James's being likewise in great disorder, he took extraordinary pains to regulate and adjust every thing, particularly the management of the poor; and thus became of signal service to his parishioners, even in a temporal view. But, say our authors, "it was their spiritual welfare which engaged, as it ought to do, his chief attention. As far as the circumstances of the times, and the populousness of that part of the metropolis allowed, he omitted not even those private admonitions and personal applications which are often attended with the happiest effects. He allowed out of his own income a salary for reading early and late prayers, which had formerly been paid out of the offertory money. He held a confirmation once every year, and examined

Secker. amined the candidates several weeks before in the vestry, and gave them religious tracts, which he also distributed at other times very liberally to those that needed them. He drew up, for the use of his parishioners, that admirable course of *Lectures on the Church Catechism* which hath been lately published, and not only read them once every week on the usual days, but also every Sunday evening, either at the church or one of the chapels belonging to it."

The sermons which at the same time, we are told, he set himself to compose, "were truly excellent and original. His faculties were now in their full vigour, and he had an audience to speak before that rendered the utmost exertion of them necessary. He did not, however, seek to gratify the higher part, by amusing them with refined speculations, or ingenious essays, unintelligible to the lower part, and unprofitable to both; but he laid before them all, with equal freedom and plainness, the great Christian duties belonging to their respective stations, and reproved the follies and vices of every rank among them, without distinction or palliation. He studied human nature thoroughly in all its various forms, and knew what sort of arguments would have most weight with each class of men. He brought the subject home to their bosoms, and did not seem to be merely saying useful things in their presence, but addressing himself personally to every one of them. Few ever possessed, in a higher degree, the rare talent of touching on the most delicate subjects with the nicest propriety and decorum, of saying the most familiar things without being low, the plainest without being feeble, the boldest without giving offence. He could descend with such singular ease and felicity into the minutest concerns of common life, could lay open with so much address the various workings, artifices, and evasions of the human mind, that his audience often thought their own particular cases alluded to, and heard with surprise their private sentiments and feelings, their ways of reasoning and principles of acting, exactly stated and described. His preaching was, at the same time, highly rational, and truly evangelical. He explained with perspicuity, he asserted with dignity, the peculiar characteristic doctrines of the gospel. He inculcated the utility, the necessity of them, not merely as speculative truths, but as actual instruments of moral goodness, tending to purify the hearts and regulate the lives of men; and thus, by God's gracious appointment, as well as by the inseparable connexion between true faith and right practice, leading them to salvation.

"These important truths he taught with the authority, the tenderness, the familiarity, of a parent instructing his children. Though he neither possessed nor affected the artificial eloquence of an orator who wants to amuse or to mislead, yet he had that of an honest man who wants to convince, of a Christian preacher who wants to reform and to save those that hear him. Solid argument, manly sense, useful directions, short nervous, striking sentences, awakening questions, frequent and pertinent applications of scripture; all these following each other in quick succession, and coming evidently from the speaker's heart, enforced by his elocution, his figure, his action, and above all by the corresponding sanctity of his example, stamped conviction on the minds of his hearers, and sent them home with impressions not easy to be effaced. It will readily be imagined that with these powers he quickly became one of the most admired and popular preachers of his time." Secker.

In 1737 he succeeded to the see of Oxford, on the promotion of Dr Potter to that of Canterbury, then vacant by the death of Archbishop Wake.

In the spring of 1748, Mrs Secker died of the gout in her stomach. She was a woman of great sense and merit, but of a weak and sickly constitution. The bishop's affection and tenderness for her was suited to his character. In 1750, he was installed dean of St Paul's, for which he gave in exchange the rectory of St James's and his prebend of Durham. "It was no wonder (say our authors) that, after presiding over so extensive and populous a parish for upwards of 17 years, he should willingly consent to be released from a burden which began now to grow too great for his strength. When he preached his farewell sermon, the whole audience melted into tears: he was followed with the prayers and good wishes of those whom every honest man would be most ambitious to please; and there are numbers still living who retain a strong and grateful remembrance of his incessant and tender solicitude for their welfare. Having now more leisure both to prosecute his own studies and to encourage those of others, he gave Dr Church considerable assistance in his *First and Second Vindication of the Miraculous Powers*, &c. against Dr Middleton, and he was of equal use to him in his *Analysis of Lord Bolingbroke's Works*. About the same time began the late Archdeacon Sharp's controversy with the followers of Mr Hutchinson, which was carried on to the end of the year 1755." Bishop Secker, we are told, read over all Dr Sharp's papers, amounting to three volumes 8vo, and corrected and improved them throughout. But the ease which this late change of situation gave him was soon disturbed by a heavy and unexpected stroke, the loss of his three friends, Bishops Butler, Benson, and Berkeley, who were all cut off within the space of one year.

Our authors next give an account of the part which Dr Secker bore, in the House of Lords, in respect to the famous repeal of the Jew bill; for which the duke of Newcastle moved, and was seconded by the Bishop, in a speech which, we are told, was remarkably well received. At length his distinguished merit prevailed over all the political obstacles to his advancement, and placed him, without any efforts or application of his own, in that important station which he had shown himself so well qualified to adorn. On the death of Archbishop Hutton, he was promoted to the see of Canterbury, and was confirmed at Bow church, April 21. 1758; on which occasion our authors observe, that in accepting this high and burdensome station, Dr Secker acted on that principle which influenced him through life; that he sacrificed his own ease and comfort to considerations of public utility; that the mere secular advantages of grandeur were objects below his ambition; and were, as he knew and felt, but poor compensations for the anxiety and difficulties attending them. He had never once through his whole life asked preferment for himself, nor shown any unbecoming eagerness for it; and the use he made of his newly acquired dignity very clearly showed, that rank, and wealth, and power, had in no other light any charms for him, than as they enlarged the sphere of his active and industrious benevolence.

 He

He sought out and encouraged men of real genius or extensive knowledge; he expended 300l. in arranging and improving the manuscript library at Lambeth; and observing with concern, that the library of printed books in that palace had received no additions since the time of Archbishop Tennison, he made it his business to collect books in all languages from most parts of Europe at a very great expence, with a view of supplying that chasm; which he accordingly did, by leaving them to the library at his death, and thereby rendered that collection one of the noblest and most useful in the kingdom.

All designs and institutions which tended to advance good morals and true religion, he patronized with zeal and generosity: he contributed largely to the maintenance of schools for the poor; to rebuilding or repairing parsonage houses and places of worship; and gave no less than 600l. towards erecting a chapel in the parish of Lambeth. To the society for promoting Christian knowledge he was a liberal benefactor; and to that for propagating the gospel in foreign parts, of which he was the president, he paid much attention; was constant at all meetings of its members, even sometimes when his health would but ill permit, and superintended their deliberations with consummate prudence and temper.

Whenever any publications came to his knowledge that were manifestly calculated to corrupt good morals, or subvert the foundations of Christianity, he did his utmost to stop the circulation of them; yet the wretched authors themselves he was so far from wishing to treat with any undue rigour, that he has more than once extended his bounty to them in distress. And when their writings could not properly be suppressed (as was too often the case) by lawful authority, he engaged men of abilities to answer them, and rewarded them for their trouble. His attention was everywhere. Even the falsehoods and misrepresentations of writers in the newspapers, on religious or ecclesiastical subjects, he generally took care to have contradicted; and when they seemed likely to injure, in any material degree, the cause of virtue and religion, or the reputation of eminent and worthy men, he would sometimes take the trouble of answering them himself. One instance of this kind, which does him honour, and deserves mention, was his defence of Bishop Butler, who, in a pamphlet published in 1767, was accused of having died a Papist. The conduct which he observed towards the several divisions and denominations of Christians in this kingdom was such as showed his way of thinking to be truly liberal and catholic. The dangerous spirit of Popery, indeed, he thought should always be kept under proper legal restraints, on account of its natural opposition not only to the religious but the civil rights of mankind. He therefore observed its movements with care, and exhorted his clergy to do the same, especially those who were situated in the midst of Roman Catholic families; against whose influence they were charged to be upon their guard, and were furnished with proper books or instructions for that purpose. He took all fit opportunities of combating the errors of the church of Rome in his own writings (A); and the best answers that were published to some of the late bold apologies for Popery were written at his instance, and under his direction.

Secker.

With the Dissenters his grace was sincerely desirous of cultivating a good understanding. He considered them, in general, as a conscientious and valuable class of men. With some of the most eminent of them, Watts, Doddridge, Leland, Chandler, Lardner, he maintained an intercourse of friendship or civility. By the most candid and considerate part of them he was highly reverenced and esteemed; and to such among them as needed help he showed no less kindness and liberality than to those of his own communion.

Nor was his concern for the Protestant cause confined to his own country. He was well known as the great patron and protector of it in various parts of Europe; from whence he had frequent applications for assistance, which never failed of being favourably received. To several foreign Protestants he allowed pensions, to others he gave occasional relief, and to some of their universities was an actual benefactor.

In public affairs, his grace acted the part of an honest citizen, and a worthy member of the British legislature. From his first entrance into the House of Peers, his parliamentary conduct was uniformly upright and noble. He kept equally clear from the extremes of factious petulance and servile dependence; never wantonly thwarting administration from motives of party zeal or private pique, or personal attachment, or a passion for popularity; nor yet going every length with every minister from views of interest or ambition. He admired and loved the constitution of his country, and wished to preserve it unaltered and unimpaired. So long as a due regard to this was maintained, he thought it his duty to support the measures of government; but whenever they were evidently inconsistent with the public welfare, he opposed them with freedom and firmness. Yet his opposition was always tempered with the utmost fidelity, respect, and decency, to the excellent prince upon the throne; and the most candid allowances for the unavoidable errors and infirmities even of the very best ministers, and the peculiarly difficult situation of those who govern a free and high-spirited people. He seldom spoke in parliament, except where the interests of religion and virtue seemed to require it; but whenever he did, he spoke with propriety and strength, and was heard with attention and deference. Though he never attached himself blindly to any set of men, yet his chief political connexions were with the late duke of Newcastle and Lord Chancellor Hardwicke. To these he principally owed his advancement; and he had the good fortune to live long enough to show his gratitude to them or their descendants.

During more than ten years that Dr Secker enjoyed the see of Canterbury, he resided constantly at his archiepiscopal house at Lambeth. A few months before his death, the dreadful pains he felt had compelled him

(A) See particularly his sermons on the rebellion in 1745; on the Protestant working schools in Ireland; on the 5th of November; and a great number of occasional passages to the same purpose, in various parts of his lectures, sermons, and other works.

him to think of trying the Bath waters; but that design was stopped by the fatal accident which put an end to his life.

His grace had been for many years subject to the gout, which, in the latter part of his life, returned with more frequency and violence, and did not go off in a regular manner, but left the parts affected for a long time very weak, and was succeeded by pains in different parts of the body. About a year and a half before he died, after a fit of the gout, he was attacked with a pain in the arm, near the shoulder, which having continued about 12 months, a similar pain seized the upper and outer part of the opposite thigh, and the arm soon became easier. This was much more grievous than the former, as it quickly disabled him from walking, and kept him in almost continual torment, except when he was in a reclining position. During this time he had two or three fits of the gout; but neither the gout nor the medicines alleviated these pains, which, with the want of exercise, brought him into a general bad habit of body.

On Saturday July 30. 1768, he was seized, as he sat at dinner, with a sickness at his stomach. He recovered before night; but the next evening, while his physicians were attending, and his servants raising him on his couch, he suddenly cried out that his thigh bone was broken. The shock was so violent, that the servants perceived the couch to shake under him, and the pain so acute and unexpected, that it overcame the firmness he so remarkably possessed. He lay for some time in great agonies; but when the surgeons arrived, and discovered with certainty that the bone was broken, he was perfectly resigned, and never afterwards asked a question about the event. A fever soon ensued. On Tuesday he became lethargic, and continued so till about five o'clock on Wednesday afternoon, when he expired with great calmness, in the 75th year of his age.

On examination, the thigh bone was found to be carious about four inches in length, and at nearly the same distance from its head. The disease took its rise from the internal part of the bone, and had so entirely destroyed its substance, that nothing remained at the part where it was broken but a portion of its outward integument; and even this had many perforations, one of which was large enough to admit two fingers, and was filled with a fungous substance arising from within the bone. There was no appearance of matter about the caries, and the surrounding parts were in a sound state. It was apparent that the torture which he underwent during the gradual corrosion of this bone must have been inexpressibly great. Out of tenderness to his family he seldom made any complaints to them, but to his physicians he frequently declared his pains were so excruciating, that unless some relief could be procured he thought it would be impossible for human nature to support them long. Yet he bore them for upwards of six months with astonishing patience and fortitude; sat up generally the greater part of the day, admitted his particular friends to see him, mixed with his family at the usual hours, sometimes with his usual cheerfulness; and, except some very slight defects of memory, retained all his faculties and senses in their full vigour till within a few days of his death. He was buried, pursuant to his own directions, in a covered passage, leading from a private door of the palace to the north door of Lambeth church; and he forbade any monument or epitaph to be placed over him.

By his will he appointed the Rev. Dr Daniel Burton, canon of Christ church, and Mrs Catherine Talbot, already mentioned in the course of these memoirs, his executors; and left 13,000l. in trust to the Drs Porteous and Stinton, his chaplains; to pay the interest thereof to Mrs Talbot and her daughter during their joint lives, or the life of the survivor; and after the decease of both these ladies, 11,000l. of the said 13,000l. are to be transferred to charitable purposes; amongst which are 1000l. to the Society for the Propagation of the Gospel, and 1000l. to the same society for a bishop or bishops in the king's dominions in America.

The following description is given of his person: He was tall and comely; in the early part of his life slender, and rather consumptive; but as he advanced in years his constitution gained strength, and his size increased, yet never to a degree of corpulency that was disproportionate or troublesome.

The dignity of his form corresponded with the greatness of his mind, and inspired at all times respect and awe; but peculiarly so when he was engaged in any of the more solemn functions of religion, into which he entered with such devout earnestness and warmth, with so just a consciousness of the place he was in, and the business he was about, as seemed to raise him above himself, and added new life and spirit to the natural gracefulness of his appearance.

His countenance was open, ingenious, and expressive of every thing right. It varied easily with his spirits and his feelings, so as to be a faithful interpreter of his mind, which was incapable of the least dissimulation. It could speak dejection, and, on occasion, anger, very strongly; but when it meant to show pleasure or approbation, it softened into a most gracious smile, and diffused over all his features the most benevolent and reviving complacency that can be imagined.

SECOMIÆ, in natural history, the name of a genus of fossils of the class of septariæ; the characters of which are, That they are bodies of a dusky hue; divided, by septa or partitions of a sparry matter, into several more or less regular portions; of a moderately firm texture; not giving fire with steel; but fermenting with acid menstrua, and easily calcining. The septariæ of this genus are of all others the most common, and are what have been known by the little expressive or mistaken names of the waxen vein, or ludus Helmontii. We have many species of these bodies common among us. Of the whitish or brownish, we have thirteen; of the yellowish five; and of the ferruginous ones four.

SECOND, in geometry, chronology, &c. the 60th part of a prime or minute, whether of a degree or of an hour.

SECOND, in music, one of the musical intervals; being only the difference between any sound and the next nearest sound, whether above or below it.

SECOND Major, in music. See INTERVAL.

SECOND Minor, in music. See INTERVAL.

SECOND Sight, in Erse called *Taisch*, is a mode of seeing superadded to that which nature generally bestows. This gift or faculty, which is neither voluntary nor

Second. nor constant, is in general rather troublesome than agreeable to the possessors of it, who are chiefly found among the inhabitants of the Highlands of Scotland, those of the Western Isles, of the Isle of Man, and of Ireland. It is an impression made either by the mind upon the eye, or by the eye upon the mind, by which things distant or future are perceived, and seen as if they were present. A man on a journey far from home falls from his horse; another, who is perhaps at work about the house, sees him bleeding on the ground, commonly with a landscape of the place where the accident befals him. Another seer, driving home his cattle, or wandering in idleness, or musing in the sunshine, is suddenly surprised by the appearance of a bridal ceremony, or funeral procession, and counts the mourners or attendants, of whom, if he knows them, he relates the names; if he knows them not, he can describe the dresses. Things distant are seen at the instant when they happen.

Of things future, Johnson says that he knows no rule pretended to for determining the time between the sight and the event; but we are informed by Mr Grose, that in general the time of accomplishment bears some relation to the time of the day in which the impressions are received. Thus visions seen early in the morning (which seldom happens) will be much sooner accomplished than those appearing at noon; and those seen at noon will take place in a much shorter time than those happening at night; sometimes the accomplishment of the last does not fall out within a year or more.

These visions are not confined to solemn or important events; nor is it true, as is commonly reported, that to the second sight nothing is presented but phantoms of evil. The future visit of a mountebank, or piper; a plentiful draught of fish; the arrival of common travellers; or, if possible, still more trifling matters than these, —are foreseen by the seers. A gentleman told Dr Johnson, that when he had once gone far from his own island one of his labouring servants predicted his return, and described the livery of his attendant, which he had never worn at home; and which had been, without any previous design, occasionally given him.

As many men eminent for science and literature have admitted the reality of this apparently useless gift, we shall, without interposing our own opinion, give the reflections of two of the first characters of the age upon it, and leave our readers to form their own judgment. By Dr Beattie of Aberdeen it is thus accounted for:—

The Highlands of Scotland are a picturesque but a melancholy country. Long tracts of mountainous desert, covered with dark heath, and often obscured by misty weather; narrow valleys, thinly inhabited, and bounded by precipices resounding with the fall of torrents: a soil so rugged, and a climate so dreary, as in many parts to admit neither the amusements of pasturage nor the labours of agriculture; the mournful dashing of waves along the friths and lakes that intersect the country; the portentous noises which every change of the wind and every increased diminution of the waters is apt to raise in a lonely region full of echoes and rocks and caverns; the grotesque and ghastly appearance of such a landscape by the light of the moon: objects like these diffuse a gloom over the fancy, which may be compatible enough with occasional and social merriment, but cannot fail to tincture the thoughts of a native in the hour of silence and solitude. If these people, notwithstanding the reformation in religion, and more frequent intercourse with strangers, do still retain many of their old superstitions, we need not doubt but in former times they must have been much more enslaved to the horrors of imagination, when beset with the bugbears of Popery and Paganism. Most of their superstitions are of a melancholy cast. That of *second sight*, by which some are still supposed to be haunted, is considered by themselves as a misfortune, on account of the many dreadful images it is said to obtrude upon the fancy. It is said that some of the Alpine regions do likewise lay claim to a sort of second sight. Nor is it wonderful, that persons of a lively imagination, immured in deep solitude, and surrounded with the stupendous scenery of clouds, precipices, and torrents, should dream (even when they think themselves awake) of those few striking ideas with which their lonely lives are diversified: of corpses, funeral processions, and other subjects of terror; or of marriages, and the arrival of strangers, and such like matters of more agreeable curiosity.

Let it be observed also, that the ancient Highlanders of Scotland had hardly any other way of supporting themselves than by hunting, fishing, or war; professions that are continually exposed to fatal accidents. And hence, no doubt, additional horrors would often haunt their solitude, and a deeper gloom overshadow the imagination even of the hardiest native.

A sufficient evidence can hardly be found for the reality of the *second sight*, or at least of what is commonly understood by that term. A treatise on the subject was published in the year 1762, in which many tales were told of persons whom the author believed to have been favoured, or haunted, with these illuminations; but most of the tales were trifling and ridiculous: and the whole work betrayed, on the part of the compiler, such extreme credulity, as could not fail to prejudice many readers against his system.

That any of these visionaries are apt to be swayed in their declarations by sinister views, we shall not say; but this may be said with confidence, that none but ignorant people pretend to be gifted in this way. And in them it may be nothing more, perhaps, than short fits of sudden sleep or drowsiness, attended with lively dreams, and arising from some bodily disorder, the effect of idleness, low spirits, or a gloomy imagination. For it is admitted, even by the most credulous Highlanders, that as knowledge and industry are propagated in their country, the second sight disappears in proportion; and nobody ever laid claim to the faculty who was much employed in the intercourse of social life (A).

(A) This, however, is denied by Johnson, who affirms that the islanders of all degrees, whether of rank or understanding, universally admit it except the ministers, who, according to him, reject it, in consequence of a system, against conviction. He affirms, too, that in 1773 there was in the Hebrides a second-sighted gentleman, who complained of the terrors to which he was exposed.

Nor is it at all extraordinary, that one ſhould have the appearance of being awake, and ſhould even think one's ſelf ſo, during thoſe fits of doſing; that they ſhould come on ſuddenly, and while one is engaged in ſome buſineſs. The ſame thing happens to perſons much fatigued, or long kept awake, who frequently fall aſleep for a moment, or for a long ſpace, while they are ſtanding, or walking, or riding on horſeback. Add but a lively dream to this ſlumber, and (which is the frequent effect of diſeaſe) take away the conſciouſneſs of having been aſleep, and a ſuperſtitious man may eaſily miſtake his dream for a waking viſion; which, however, is ſoon forgotten when no ſubſequent occurrence recals it to his memory; but which, if it ſhall be thought to reſemble any future event, exalts the poor dreamer into a Highland prophet. This conceit makes him more recluſe and more melancholy than ever: and ſo feeds his diſeaſe, and multiplies his viſions: which, if they are not diſſipated by buſineſs or ſociety, may continue to haunt him as long as he lives; and which, in their progreſs through the neighbourhood, receive ſome new tinctures of the marvellous from every mouth that promotes their circulation. As to the prophetical nature of this ſecond ſight, it cannot be admitted at all. That the Deity ſhould work a miracle in order to give intimation of the frivolous things that theſe tales are made up of, the arrival of a ſtranger, the nailing of a coffin, or the colour of a ſuit of clothes; and that theſe intimations ſhould be given for no end, and to thoſe perſons only who are idle and ſolitary, who ſpeak Gaelic, or who live among mountains and deſerts—is like nothing in nature or providence that we are acquainted with; and muſt therefore, unleſs it were confirmed by ſatisfactory proof (which is not the caſe), be rejected as abſurd and incredible.

Theſe viſions, ſuch as they are, may reaſonably enough be aſcribed to a diſtempered fancy. And that in them, as well as in our ordinary dreams, certain appearances ſhould, on ſome rare occaſions, reſemble certain events, is to be expected from the laws of chance; and ſeems to have in it nothing more marvellous or ſupernatural, than that the parrot, who deals out his ſcurrilities at random, ſhould ſometimes happen to ſalute the paſſenger by his right appellation.

To the confidence of theſe objections Dr Johnſon replies, that by preſuming to determine what is fit, and what is beneficial, they preſuppoſe more knowledge of the univerſal ſyſtem than man has attained; and therefore depend upon principles too complicated and extenſive for our comprehenſion; and that there can be no ſecurity in the conſequence when the premiſes are not underſtood; that the ſecond ſight is only wonderful becauſe it is rare, for, conſidered in itſelf, it involves no more difficulty than dreams, or perhaps than the regular exerciſe of the cogitative faculty; that a general opinion of communicative impulſes, or viſionary repreſentations, has prevailed in all ages and all nations; that particular inſtances have been given with ſuch evidence, as neither Bacon nor Bayle has been able to reſiſt; that ſudden impreſſions, which the event has verified, have been felt by more than own or publiſh them; that the ſecond ſight of the Hebrides implies only the local frequency of a power, which is nowhere totally unknown; and that where we are unable to decide by antecedent reaſon, we muſt be content to yield to the force of teſtimony. By pretenſion to ſecond ſight, no profit was ever ſought or gained. It is an involuntary affection, in which neither hope nor fear are known to have any part. Thoſe who profeſs to feel it do not boaſt of it as a privilege, nor are conſidered by others as advantageouſly diſtinguiſhed. They have no temptation to feign, and their hearers have no motive to encourage the impoſture.

Second Terms, in algebra, thoſe where the unknown quantity has a degree of power leſs than it has in the term where it is raiſed to the higheſt. The art of throwing thoſe ſecond terms out of an equation, that is, of forming a new equation where they have no place, is one of the moſt ingenious and uſeful inventions in all algebra.

SECONDARY, in general, ſomething that acts as ſecond or in ſubordination to another.

Secondary or *Secundary*, an officer who acts as ſecond or next to the chief officer. Such are the ſecondaries of the courts of king's bench and common pleas; the ſecondaries of the compters, who are next the ſheriffs of London in each of the two compters; two ſecondaries of the pipe; ſecondaries to the remembrancers, &c.

Secondary Circles of the Ecliptic are circles of longitude of the ſtars; or circles which, paſſing through the poles of the ecliptic, are at right angles to the ecliptic. See *Circles of Latitude*.

Secondary Qualities of Bodies. See Metaphysics, N° 153.

SECONDAT. See Montesquieu.

SECRETARIES bird, the falco ſerpentarius and ſagittarius of Linnæus, but claſſed by Latham under the genus Vultur; which ſee.

SECRETARY, an officer who, by his maſter's orders, writes letters, deſpatches, and other inſtruments, which he renders authentic by his ſignet. Of theſe there are ſeveral kinds: as, 1. Secretaries of ſtate, who are officers that have under their management and direction the moſt important affairs of the kingdom, and are obliged conſtantly to attend on the king: they receive and deſpatch whatever comes to their hands, either from the crown, the church, the army, private grants, pardons, diſpenſations, &c. as likewiſe petitions to the ſovereign, which, when read, are returned to them; all which they deſpatch according to the king's direction. They have authority to commit perſons for treaſon, and other offences againſt the ſtate, as conſervators of the peace at common law, or as juſtices of the peace throughout the kingdom. They are members of the privy-council, which is ſeldom or never held without one of them being preſent. As to the buſineſs and correſpondence in all parts of this kingdom, it is managed by either of the ſecretaries without any diſtinction; but with reſpect to foreign affairs, the buſineſs is divided into two provinces or departments, the ſouthern and the northern, comprehending all the kingdoms and ſtates that have any intercourſe with Great Britain; each ſecretary receiving all letters and addreſſes from, and making all deſpatches to, the ſeveral princes and ſtates comprehended in his province. Ireland and the plantations are under the direction of the elder ſecretary, who has the ſouthern province, which alſo comprehends France, Italy, Switzerland, Spain, Portugal, and Turkey; the northern province includes the Low Countries,

Secretary ‖ Sector.

tries, Germany, Denmark, Sweden, Poland, and Moscovy. Each of the secretaries has an apartment in all the royal houses, both for their own accommodation and their officers; they have also a table at the king's charge, or else board wages. The two secretaries for Britain have each two under secretaries, and one chief clerk; with an uncertain number of other clerks and translators, all wholly depending on them. To the secretaries of state belong the custody of that seal properly called the *signet*, and the direction of two other offices, one called the *paper office*, and the other the *signet office*. In addition to these, there is at present (1795) a secretary for the war department, whose office must be temporary. 2. Secretary of an embassy, a person attending an ambassador, for writing despatches relating to the negotiation. There is a great difference between the secretary of an embassy and the ambassador's secretary; the last being a domestic or menial of the ambassador, and the first a servant or minister of the prince. 3. The secretary of war, an officer of the war office, who has two chief clerks under him, the last of which is the secretary's messenger. There are also secretaries in most of the other offices.

SECRETION, in the animal economy. See PHYSIOLOGY, Sect. VI.

SECT, a collective term, comprehending all such as follow the doctrines and opinions of some famous divine, philosopher, &c.

SECTION, in general, denotes a part of a divided thing, or the division itself. Such, particularly, are the subdivisions of a chapter; called also *paragraphs* and *articles*: the mark of a section is §.

SECTION, in geometry, denotes a side or surface of a body or figure cut off by another; or the place where lines, planes, &c. cut each other.

SECTOR, in geometry, is a part of a circle comprehended between two radii and the arch; or it is a mixed triangle, formed by two radii and the arch of a circle.

or SECTOR, is also a mathematical instrument, of great use in finding the proportion between quantities of the same kind: as between lines and lines, surfaces and surfaces, &c. whence the French call it the *compass of proportion*. The great advantage of the sector above the common scales, &c. is, that it is made so as to fit all radii and all scales. By the lines of chords, sines, &c. on the sector, we have lines of chords, sines, &c. to any radius betwixt the length and breadth of the sector when open.

The real inventor of this valuable instrument is unknown; yet of so much merit has the invention appeared, that it was claimed by Galileo, and disputed by nations.

The sector is founded on the fourth proposition of the sixth book of Euclid; where it is demonstrated that similar triangles have their homologous sides proportional. An idea of the theory of its construction may be conceived thus: Let the lines AB, AC (Plate CCCCXLVIII. fig. 5.) represent the legs of the sector; and AD, AE, two equal sections from the centre: if, now the points CB and DE be connected, the lines CB and DE will be parallel; therefore the triangles ADE, ACB will be similar; and consequently the sides AD, DE, AB, and BC, proportional; that is, as AD : DE :: AB : BC: whence, if AD be the half, third, or fourth part of AB; DE will be a half, third, or fourth part of CB: and the same holds of all the rest. If, therefore, AD be the chord, sine, or tangent, of any number of degrees to the radius AB; DE will be the same to the radius BC.

2 described.

Description of the Sector. The instrument consists of two rulers or legs, of brass or ivory, or any other matter, representing the radii, moveable round an axis or joint, the middle of which expresses the centre; whence are drawn on the faces of the rulers several scales, which may be distinguished into single and double.

The double scales, or lines graduated upon the faces of the instrument, and which are to be used as sectoral lines, proceed from the centre; and are, 1. Two scales of equal parts, one on each leg, marked LIN. or L. each of these scales, from the great extensiveness of its use, is called the *line of lines*. 2. Two lines of chords marked CHO. or C. 3. Two lines of secants marked SEC. or S. A line of polygons marked POL. Upon the other face the sectoral lines are, 1. Two lines of sines marked SIN. or S. 2. Two lines of tangents marked TAN. or T. 3. Between the line of tangents and sines there is another line of tangents to a lesser radius, to supply the defect of the former, and extending from 45° to 75°, marked *t*.

Each pair of these lines (except the line of polygons) is so adjusted as to make equal angles at the centre; and consequently at whatever distance the sector be opened, the angles will be always respectively equal. That is, the distance between 10 and 10 on the line of lines, will be equal to 60 and 60 on the line of chords, 90 and 90 on the line of sines, and 45 and 45 on the line of tangents.

Besides the sectoral scales, there are others on each face, placed parallel to the outward edges, and used as those of the common plane scale. 1. These are a line of inches. 2. A line of latitudes. 3. A line of hours. 4. A line of inclination of meridians. 5. A line of chords. Three logarithmic scales, namely, one of numbers, one of sines, and one of tangents; these are used when the sector is fully opened, the legs forming one line (A).

The value of the divisions on most of the lines is determined by the figures adjacent to them; these proceed by tens, which constitute the divisions of the first order, and are numbered accordingly; but the value of the divisions on the line of lines, that are distinguished by figures, is entirely arbitrary, and may represent any value that is given to them; hence the figures 1, 2, 3, 4, &c. may denote either 10, 20, 30, 40, or 100, 200, 300, 400, and so on. 3 To read and estimate the divisions on the sector lines.

The line of lines is divided into ten equal parts, numbered 1, 2, 3, to 10; these may be called *divisions of the first order*; each of these are again subdivided into 10 other equal parts, which may be called *divisions of the second order*; each of these is divided into two equal parts, forming *divisions of the third order*. The divisions on all the scales are contained between four parallel lines; those

(A) The lines are placed in different orders on different sectors; but they may easily be found by these general directions.

Sector.

thofe of the firft order extend to the moft diftant; thofe of the third to the leaft; thofe of the fecond to the intermediate parallel.

When the whole line of lines reprefents 100, the divifions of the firft order, or thofe to which the figures are annexed, reprefent tens; thofe of the fecond order units; thofe of the third order the halves of thefe units. If the whole line reprefent ten, then the divifions of the firft order are units; thofe of the fecond tenths; the thirds twentieths.

In the line of tangents, the divifions to which the numbers are affixed, are the degrees expreffed by thofe numbers. Every fifth degree is denoted by a line fomewhat longer than the reft; between every number and each fifth degree, there are four divifions, longer than the intermediate adjacent ones, thefe are whole degrees: the fhorter ones, or thofe of the third order, are 30 minutes.

From the centre, to 60 degrees, the line of fines is divided like the line of tangents, from 60 to 70; it is divided only to every degree, from 70 to 80, to every two degrees, from 80 to 90; the divifion muft be eftimated by the eye.

The divifions on the line of chords are to be eftimated in the fame manner as the tangents.

The leffer line of tangents is graduated every two degrees, from 45 to 50; but from 50 to 60 to every degree; from 60 to the end, to half degrees.

The line of fecants from 0 to 10 is to be eftimated by the eye; from 20 to 50, it is divided to every two degrees; from 50 to 60, to every degree; from 60 to the end, to every half degree.

4 Divifion of a given line by the line of equal parts.

Ufe of the Line of Equal Parts on the SECTOR. 1. To divide a given line into any number of equal parts, fuppofe feven. Take the given line in your compaffes; and fetting one foot in a divifion of equal parts, that may be divided by feven, for example 70, whofe feventh part is 10, open the fector till the other point fall exactly on 70, in the fame line on the other leg. In this difpofition, applying one point of the compaffes to 10 in the fame line; fhut them till the other fall in 10 in the fame line on the other leg, and this opening will be the feventh part of the given line. Note, If the line to be divided be too long to be applied to the legs of the fector, divide only one half or one fourth by feven, and the double or quadruple thereof will be the feventh part of the whole.

5 To meafure the perimeter of a polygon.

2. To meafure the lines of the perimeter of a polygon, one of which contains a great number of equal parts. Take the given line in your compaffes, and fet it parallel, upon the line of equal parts, to the number on each leg expreffing its length. The fector remaining thus, fet off the length of each of the other lines parallel to the former, and the number each of them falls on will exprefs its length.

6 Subtraction.

3. A right line being given, and the number of parts it contains, fuppofe 120, to take from it a fhorter line, containing any number of the fame parts, fuppofe 25. Take the given line in your compaffes, open the fector till the two feet fall on 120 on each leg; then will the diftance between 25 on one leg, and the fame number on the other, give the line required.

7 Multiplication.

4. To multiply by the line of equal parts on the fector. Take the lateral diftance from the centre of the line to the given multiplication; open the fector till you fit that lateral diftance to the parallel of 1 and 1, or 10 and 10, and keep the fector in that pofition; then take in the compaffes the parallel diftance of the multiplicand, which diftance, meafured laterally on the fame line, will give the product required. Thus, fuppofe it were required to find the product of 8 multiplied by 4: take the lateral diftance from the centre of the line to 4 in your compaffes, i. e. place one foot of the compaffes in the beginning of the divifions, and extend the other along the line to 4. Open the fector till you fit this lateral diftance to the parallel of 1 and 1, or 10 and 10. Then take the parallel diftance of 8, the multiplicand; i. e. extend the compaffes from 8, in this line, on one leg, to 8 in the fame line on the other; and that extent, meafured laterally, will give the product required.

8 Divifion in general.

5. To divide by the line of equal parts on the fector. Extend the compaffes laterally from the beginning of the line to 1, and open the fector till you fit that extent to the parallel of the divifor; then take the parallel diftance of the dividend, which extent, meafured in a lateral direction, will give the quotient required. Thus, fuppofe it was required to divide 36 by 4; extend the compaffes laterally, the beginning of the line to 1, and fit to that extent the parallel, of 4 the divifor; then extend the compaffes parallel, from 36 on one leg to 36 on the other, and that extent, meafured laterally, will give 9, the quotient required.

9 Proportion.

6. Proportion by the line of equal parts. Make the lateral diftance of the fecond term the parallel diftance of the firft term, the parallel diftance of the third term is the fourth proportional. *Example.* To find a fourth proportional to 8, 4, and 6, take the lateral diftance of 4, and make it the parallel diftance of 8; then the parallel diftance of 6, extended from the centre, fhall reach to the fourth proportional 3.

In the fame manner, a third proportional is found to two numbers. Thus, to find a third proportional to 8 and 4, the fector remaining as in the former example, the parallel diftance of 4, extended from the centre, fhall reach to the third proportional 2. In all thefe cafes, if the number to be made a parallel diftance be too great for the fector, fome aliquot part of it is to be taken, and the anfwer is to be multiplied by the number by which the firft number was divided.

10 Line of chords.

Ufe of the Line of Chords on the SECTOR. 1. To open the fector fo as the two lines of chords may make an angle or number of degrees, fuppofe 40. Take the diftance from the joint to 40, the number of the degrees propofed, on the line of chords; open the fector till the diftance from 60 to 60, on each leg, be equal to the given diftance of 40: then will the two lines on the fector form an angle of 40 degrees, as was required.

2. The fector being opened, to find the degrees of its aperture. Take the extent from 60 to 60, and lay it off on the line of chords from the centre: the number whereon it terminates will fhow the degrees, &c. required.

3. To lay off any number of degrees upon the circumference of a circle. Open the fector till the diftance between 60 and 60 be equal to the radius of the given circle; then take the parallel extent of the chord of the number of degrees on each leg of the fector, and lay

lay it off on the circumference of the given circle.— Hence any regular polygon may be eaſily inſcribed in a given circle.

Uſe of the Line of Polygons on the SECTOR. 1. To inſcribe a regular polygon in a given circle. Take the ſemidiameter of the given circle in the compaſſes, and adjuſt it to the number 6, on the line of polygons, on each leg of the ſector: then, the ſector remaining thus opened, take the diſtance of the two equal numbers, expreſſing the number of ſides the polygon is to have; *e. gr.* the diſtance from 5 to 5 for a pentagon, from 7 to 7 for a heptagon, &c. Theſe diſtances carried about the circumference of the circle, will divide it into ſo many equal parts.

2. To deſcribe a regular polygon, *e. gr.* a pentagon, on a given right line. Take the length of the line in the compaſſes, and apply it to the extent of the number 5, 5, on the lines of polygons. The ſector thus opened, upon the ſame lines take the extent from 6 to 6; this will be the ſemidiameter of the circle the polygon is to be inſcribed in. If then, with this diſtance, from the ends of the given line, you deſcribe two arches of the circle, their interſection will be the centre of the circle.

3. On a right line, to deſcribe an iſoſceles triangle, having the angles at the baſe double that at the vertex. Open the ſector, till the ends of the given line fall on 10 and 10 on each leg; then take the diſtance from 6 to 6. This will be the length of the two equal ſides of the triangle.

Uſe of the Lines of Sines, Tangents, and Secants, on the SECTOR. By the ſeveral lines diſpoſed on the ſector, we have ſcales to ſeveral radii; ſo that having a length or radius given, not exceeding the length of the ſector when opened, we find the chord, ſine, &c. thereto: *e. gr.* Suppoſe the chord, ſine, or tangent, of 10 degrees, to a radius of 3 inches required; make 3 inches the aperture, between 60 and 60, on the lines of chords of the two legs; then will the ſame extent reach from 45 to 45 on the line of tangents, and from 90 to 90 on the line of the ſines on the other ſide; ſo that to whatever radius the line of chords is ſet, to the ſame are all the others ſet. In this diſpoſition, therefore, if the aperture between 10 and 10, on the lines of chords, be taken with the compaſſes, it will give the chord of 10 degrees. If the aperture of 10 and 10 be in like manner taken on the lines of ſines, it will be the ſine of 10 degrees. Laſtly, If the aperture of 10 and 10 be in like manner taken on the lines of tangents, it gives the tangent of 10 degrees.

If the chord, or tangent, of 70 degrees were required; for the chord, the aperture of half the arch, viz. 35, muſt be taken, as before; which diſtance, repeated twice, gives the chord of 70 degrees. To find the tangent of 70 degrees to the ſame radius, the ſmall line of tangents muſt be uſed, the other only reaching to 45: making, therefore, 3 inches the aperture between 45 and 45 on the ſmall line; the extent between 70 and 70 degrees on the ſame, will be the tangent of 70 degrees to 3 inches radius.

To find the ſecant of an arch, make the given radius the aperture between 0 and 0 on the lines of ſecants: then will the aperture of 10 and 10, or 70 and 70, on the ſaid lines, give the tangent of 10° or 70°.

If the converſe of any of theſe things were required, that is, if the radius be required, to which a given line is the ſine, tangent, or ſecant, it is but making the given line, if a chord, the aperture on the line of chords, between 10 and 10, and then the ſector will ſtand at the radius required; that is, the aperture between 60 and 60 on the ſaid line is the radius. If the given line were a ſine, tangent, or ſecant, it is but making it the aperture of the given number of degrees; then will the diſtance of 90 and 90 on the ſines, of 45 and 45 on the tangents, of 0 and 0 on the ſecants, be the radius.

Aſtronomical SECTOR. See ASTRONOMICAL *Sector*.

Dialing SECTOR. See DIALING.

SECULAR, that which relates to affairs of the preſent world, in which ſenſe the word ſtands oppoſed to *ſpiritual, eccleſiaſtical*: thus we ſay ſecular power, &c.

SECULAR, is more peculiarly uſed for a perſon who lives at liberty in the world, not ſhut up in a monaſtery, nor bound by vows, or ſubjected to the particular rules of any religious community; in which ſenſe it ſtands oppoſed to *regular*. The Romiſh clergy are divided into ſecular and regular, of which the latter are bound by monaſtic rules, the former not.

SECULAR *Games*, in antiquity, ſolemn games held among the Romans once in an age. Theſe games laſted three days and as many nights; during which time ſacrifices were performed, theatrical ſhows exhibited, with combats, ſports, &c. in the circus. The occaſion of theſe games, according to Valerius Maximus, was to ſtop the progreſs of a plague. Valerius Publicola was the firſt who celebrated them at Rome in the year of the city 245. The ſolemnity was as follows: The whole world was invited by a herald to a feaſt which they had never ſeen already, nor ever ſhould ſee again. Some days before the games began, the quindecemviri in the Capitol and the Palatine temple, diſtributed to the people purifying compoſitions, of various kinds, as flambeaus, ſulphur, &c. From hence the populace paſſed to Diana's temple on the Aventine mount, with wheat, barley, and oats, as an offering. After this, whole nights were ſpent in devotion to the Deſtinies. When the time of the games was fully come, the people aſſembled in the Campus Martius, and ſacrificed to Jupiter, Juno, Apollo, Latona, Diana, the Parcæ, Ceres, Pluto, and Proſerpine. On the firſt night of the feaſt the emperor, with the quindecemviri, cauſed three altars to be erected on the banks of the Tiber, which they ſprinkled with the blood of three lambs, and then proceeded to regular ſacrifice. A ſpace was next marked out for a theatre, which was illuminated with innumerable flambeaus and fires. Here they ſung hymns, and celebrated all kinds of ſports. On the day after, having offered victims at the Capitol, they went to the Campus Martius, and celebrated ſports to the honour of Apollo and Diana. Theſe laſted till next day, when the noble matrons, at the hour appointed by the oracle, went to the Capitol to ſing hymns to Jupiter. On the third day, which concluded the ſolemnity, twenty-ſeven boys, and as many girls, ſung in the temple of Palatine Apollo hymns and verſes in Greek and Latin, to recommend the city to the protection of thoſe deities whom they deſigned particularly to honour by their ſacrifices.

The inimitable Carmen Seculare of Horace was compoſed for this laſt day, in the Secular Games held by Auguſtus.

Secular ‖ Secundus.

It has been much disputed whether these games were held every hundred, or every hundred and ten years. Valerius Antius, Varro, and Livy, are quoted in support of the former opinion: In favour of the latter may be produced the quindecemviral registers, the edicts of Augustus, and the words of Horace in the Secular poem,

Certus undenos decies per annos.

It was a general belief, that the girls who bore a part in the song should be soonest married; and that the children who did not dance and sing at the coming of Apollo, should die unmarried, and at an early period of life.

Secular Poem, a poem sung or rehearsed at the secular games; of which kind we have a very fine piece among the works of Horace, being a sapphic ode at the end of his epodes.

SECULARIZATION, the act of converting a regular person, place, or benefice, into a secular one. Almost all the cathedral churches were anciently regular, that is, the canons were to be religious; but they have been since secularized. For the secularization of a regular church, there is required the authority of the pope, that of the prince, the bishop of the place, the patron, and even the consent of the people. Religious that want to be released from their vow, obtain briefs of secularization from the pope.

SECUNDINES, in anatomy, the several coats or membranes wherein the fœtus is wrapped up in the mother's womb; as the chorion and amnios, with the placenta, &c.

SECUNDUS (Joannes Nicolaus), an elegant writer of Latin poetry, was born at the Hague in the year 1511. His descent was from an ancient and honourable family in the Netherlands; and his father Nicolaus Everardus, who was born in the neighbourhood of Middleburg, seems to have been high in the favour of the emperor Charles V. as he was employed by that monarch in several stations of considerable importance. We find him first a member of the grand parliament or council of Mechelen, afterwards president of the states of Holland and Zealand at the Hague, and lastly holding a similar office at Mechelen, where he died, August 5. 1532, aged 70.

These various employments did not occupy the whole of Everardus's time. Notwithstanding the multiplicity of his business, he found leisure to cultivate letters with great success, and even to act as preceptor to his own children, who were five sons and three daughters. They all took the name of Nicolaii from their father; but on what account our author was called *Secundus* is not known. It could not be from the order of his birth, for he was the youngest son. Perhaps the name was not given him till he became eminent; and then, according to the fashion of the age, it might have its rise from some pun, such as his being *Poetarum nemini Secundus*. Poetry, however, was by no means the profession which his father wished him to follow. He intended him for the law, and when he could no longer direct his studies himself, placed him under the care of *Jacobus Valeardus*. This man is said to have been every way well qualified to discharge the important trust which was committed to him; and he certainly gained the affection of his pupil, who, in one of his poems, mentions the death of Valeardus with every appearance of unfeigned sorrow. Another tutor was soon provided; but it does not appear that Secundus devoted much of his time to legal pursuits. Poetry and the sister arts of painting and sculpture had engaged his mind at a very early period; and the imagination, on which these have laid hold, can with difficulty submit to the dry study of musty civilians. Secundus is said to have written verses when but ten years old; and from the vast quantity which he left behind him, we have reason to conclude that such writing was his principal employment. He found time, however, to carve figures of all his own family, of his mistresses, of the emperor Charles V. of several eminent personages of those times, and of many of his intimate friends; and in the last edition of his works published by Scriverius at Leyden, 1631, there is a print of one of his mistresses with this inscription round it, VATIS AMATORIS JULIA SCULPTA MANU.

Secundus.

Secundus having nearly attained the age of twenty one, and being determined, as it would seem, to comply as far as possible with the wishes of his father, quitted Mechelen, and went to France, where at *Bourges*, a city in the *Orleanois*, he studied the civil law under the celebrated *Andreas Alciatus*. Alciatus was one of the most learned civilians of that age; but what undoubtedly endeared him much more to our author was his general acquaintance with polite literature, and more particularly his taste in poetry. Having studied a year under this eminent professor, and taken his degrees, Secundus returned to Mechelen, where he remained only a very few months. In 1533 he went into Spain with warm recommendations to the count of Nassau and other persons of high rank; and soon afterwards became secretary to the cardinal archbishop of Toledo in a department of business which required no other qualifications than what he possessed in a very eminent degree, a facility in writing with elegance the Latin language. It was during his residence with this cardinal that he wrote his *Basia*, a series of wanton poems, of which the fifth, seventh, and ninth *carmina* of *Catullus* seem to have given the hint. Secundus was not, however, a servile imitator of Catullus. His expressions seem to be borrowed rather from *Tibullus* and *Propertius*; and in the warmth of his descriptions he surpasses every thing that has been written on similar subjects by *Catullus*, *Tibullus*, *Propertius*, *C. Gallus*, *Ovid*, or *Horace*.

In 1535 he accompanied the emperor Charles V. to the siege of Tunis, but gained no laurels as a soldier. The hardships which were endured at that memorable siege were but little suited to the soft disposition of a votary of Venus and the Muses; and upon an enterprise which might have furnished ample matter for an epic poem, it is remarkable that Secundus wrote nothing which has been deemed worthy of preservation. Having returned from his martial expedition, he was sent by the cardinal to Rome to congratulate the pope upon the success of the emperor's arms; but was taken so ill on the road, that he was not able to complete his journey. He was advised to seek, without a moment's delay, the benefit of his native air; and that happily recovered him.

Having now quitted the service of the archbishop of Toledo, Secundus was employed in the same office of secretary by the bishop of Utrecht; and so much had he

ndus tores. he hitherto distinguished himself by the classical elegance of his compositions, that he was soon called upon to fill the important post of private Latin secretary to the emperor, who was then in Italy. This was the most honourable office to which our aothor was ever appointed; but before he could enter upon it death put a stop to his career of glory. Having arrived at *Saint Amand* in the district of *Tournay*, in order to meet, upon business, with the bishop of Utrecht, he was on the 8th of October 1536 cut off by a violent fever, in the very flower of his age, not having quite completed his twenty-fifth year. He was interred in the church of the Benedictines, of which his patron, the bishop, was *abbot* or *pro-abbot;* and his near relations erected to his memory a marble monument, with a plain inscription.

The works of Secundus have gone though several editions, of which the best and most copious is that of Scriverius already mentioned. It consists of JULIA, *Eleg. Lib.* 1.; AMORES, *Eleg. Lib.* 2.; AD DIVERSOS *Eleg. Lib.* 3.; BASIA, styled by the editor *incomparabilis et divinus prorsus liber;* EPIGRAMMATA; ODARUM *liber unus;* EPISTOLARUM *liber unus Elegiaca;* EPISTOLARUM *liber alter, heroico carmine scriptus;* FUNERUM *liber unus;* SYLVÆ *et* CARMINUM *fragmenta;* POEMATA *nonnulla fratrum;* ITINERARIA *Secundi tria,* &c.; EPISTOLÆ *totidem, soluta oratione.* Of these works it would be superfluoos in us to give any character after the ample testimonies prefixed to them of *Lelius Greg. Gyraldus*, the elder *Scaliger*, *Theodore Beza*, and others equally celebrated in the republic of letters, who all speak of them with rapture. A French critic, indeed, after having affirmed that the genius of Secundus never produced any thing which was not excellent in its kind, adds, with too much truth, *Mais sa muse est un peu trop lascive.* For this fault our author makes the following apology in an epigram addressed to the grammarians;

Carmina cur spargam cunctis lasciva libellis,
Queritis? Insulsos arceo grammaticos.
Fortia magnanimi canerem si Cæsaris arma,
Factave DIVORUM religiosa VIRûM;
Quot miser exciperemque notas, patererque lituras?
Qunt fierem teneris suppliciom pueris!
At nunc uda mihi dictant cum BASIA carmen,
Pruriet et versu mentula multa oeo;
Me leget innuptæ jovenis placiturus amicæ,
Et placitura uova blanda puella viro:
Et quemcunque juvat lepidorum de grege vatum
Otia festivis ludere deliciis.

DURAM FORTE MEIS OSSIBUS OPTET HUMUM.

SECURIDACA, a plant belonging to the class of diadelphia, and to the order of octandria. The calyx has three leaves, which are small, deciduous, and coloured. The corolla is papilionaceous. The vexillum, consisting of two petals, is oblong, straight, and conjoined to the carina at the base. The carina is of the same length with the alæ. The legumen is ovated, unilocular, monospermous, and ending in a ligulated ala. There are two species, the *erecta* and *volubilis.* The erecta has an upright stem: the volobilis or scandens is a climbing plant, and is a native of the West Indies.

SECUTORES, a species of gladiators among the Romans, whose arms were a helmet, a shield, and a sword or a leaden bullet. They were armed in this manner, because they had to contend with the retiarii, who were dressed in a short tunic, bore a three-pointed lance in their left hand, and a net in their right. The retiarius attempted to cast his net over the head of the secutor; and if he succeeded, he drew it together and slew him with his trident: but if he missed his aim, he immediately betook himself to flight till he could find a second opportunity of entangling his adversary with his net. He was pursued by the secutor, who endeavoured to despatch him in his flight.

Secutores was also a name giveo to such gladiators who took the place of those killed in the combat, or who engaged the conqueror. This post was usually taken by lot.

Sedan, Sedition. SEDAN is a town of Champagne in France, in E. Long. 4. 45. N. Lat. 49. 46. This is the capital of a principality of the same name, situated on the Maese, six miles from Bouillon, and fifteen from Charleville. Its situation on the frontiers of the territory of Liege, Namur, and Limburg, formerly rendered it one of the keys of the kingdom. It is extremely well fortified, and defended by a strong citadel. The castle is situated on a rock, surrounded with large towers and strong walls: here you see a most beautiful magazine of ancient arms. The governor's palace is opposite the castle. From the ramparts you have a most agreeable prospect of the Maese and the neighbouring country. Though the town is but small, yet it is full of tradesmen, as tanners, weavers, dyers, &c. the manufacture of fine cloth io this city employing a great number of hands. The principality of Sedan formerly belonged to the duke of Bouillon, who was obliged in the beginning of the last century to resign it to the crown.

SEDAN-CHAIR is a covered vehicle for carrying a single person, suspended by two poles, and borne by two men, hence denominated *chairmen.* They were first introduced io London in 1634, when Sir Sanders Duncomb obtained the sole privilege to use, let, and hire a number of the said covered chairs for fourteen years.

SEDITION, among civilians, is used for a factious commotion of the people, or an assembly of a number of citizens without lawful authority, tending to disturb the peace and order of the society. This offence is of different kinds: some seditions more immediately threatening the supreme power, and the subversion of the present constitution of the state; others tending only towards the redress of private grievances. Among the Romans, therefore, it was variously punished, according as its end and tendency threatened greater mischief. See Lib. I. *Cod. de Seditiosis*, and *Mat. de Crimin.* Lib. II. n. 5. *de Læsa Majestate.* In the punishment, the authors and ringleaders were justly distinguished from those who, with less wicked inteotion, joined and made part of the multitude.

The same distinctioo holds in the law of England and in that of Scotland. Some kinds of sedition in England amount to high treason, and come within the stat. 25 Edw. III. as levying war against the king. And several seditions are mentioned io the Scotch acts of parliament as treasonable. *Bayne's Crim. Law of Scotland*, p. 33, 34. The law of Scotland makes riotous and tumultuous assemblies a species of sedition. But the law there, as well as in England, is now chiefly regulated

regulated by the riot act, made 1 Geo. I. only it is to be observed, that the proper officers in Scotland, to make the proclamation thereby enacted, are sheriffs, stewards and bailies of regalities, or their deputies; magistrates of royal boroughs, and all other inferior judges and magistrates; high and petty constables, or other officers of the peace, in any county, stewartry, city, or town. And in that part of the island, the punishment of the offence is any thing short of death which the judges, in their discretion, may appoint.

SEDATIVES, in medicine, a general name for such medicines as weaken the powers of nature, such as blood-letting, cooling salts, purgatives, &c.

SE DEFENDENDO, in law, a plea used for him that is charged with the death of another, by alleging that he was under a necessity of doing what he did in his own defence; as that the other assaulted him in such a manner, that if he had not done what he did, he must have been in hazard of his own life. See HOMICIDE and MURDER.

SEDIMENT, the settlement or dregs of any thing, or that gross heavy part of a fluid body which sinks to the bottom of the vessel when at rest.

SEDLEY (Sir Charles), an English poet and wit, the son of Sir John Sedley of Aylesford in Kent, was born about the year 1639. At the Restoration he came to London to join the general jubilee; and commenced wit, courtier, poet, and gallant. He was so much admired, that he became a kind of oracle among the poets; which made King Charles tell him, that Nature had given him a patent to be Apollo's viceroy. The productions of his pen were some plays, and several delicately tender amorous poems, in which the softness of the verses was so exquisite, as to be called by the duke of Buckingham *Sedley's witchcraft*. "There were no marks of genius or true poetry to be descried, (say the authors of the *Biographia Britannica*); the art wholly consisted in raising loose thoughts and lewd desires, without giving any alarm; and so the poison worked gently and irresistibly. Our author, we may be sure, did not escape the infection of his own art, or rather was first tainted himself before he spread the infection to others."—A very ingenious writer of the present day, however, speaks much more favourably of Sir Charles Sedley's writings. "He studied human nature; and was distinguished for the art of making himself agreeable, particularly to the ladies; for the verses of Lord Rochester, beginning with, *Sedley has that prevailing gentle art*, &c. so often quoted, allude not to his *writings*, but to his *personal address*." [*Langhorn's Effusions*, &c.]—But while he was thus in reputation for wit and in favour with the king, he grew poor and debauched: his estate was impaired, and his morals were corrupted. One of his frolics, however, being followed by an indictment and a heavy fine, Sir Charles took a more serious turn, applied himself to business, and became a member of parliament, in which he was a frequent speaker. We find him in the house of commons in the reign of James II. whose attempts upon the constitution he vigorously withstood; and he was very active in bringing on the Revolution. This was thought more extraordinary, as he had received favours from James. But that prince had taken a fancy to Sir Charles's daughter (though it seems she was not very handsome), and, in consequence of his intrigues with her, he created Miss Sedley countess of Dorchester. This honour, so far from pleasing, greatly shocked Sir Charles. However libertine he himself had been, yet he could not bear the thoughts of his daughter's dishonour; and with regard to her exaltation, he only considered it as rendering her more conspicuously infamous. He therefore conceived a hatred for the king; and from this, as well as other motives, readily joined to dispossess him of the throne. A witty saying of Sedley's, on this occasion, is recorded. "I hate ingratitude, (said Sir Charles); and therefore, as the king has made my daughter a countess, I will endeavour to make his daughter a queen;" meaning the princess Mary, married to the prince of Orange, who dispossessed James of the throne at the Revolution. He lived to the beginning of Queen Anne's reign; and his works were printed in 2 vols. 8vo, 1719.

SEDR, or SEDRE, the high-priest of the sect of Ali among the Persians. The sedre is appointed by the emperor of Persia, who usually confers the dignity on his nearest relation. The jurisdiction of the sedre extends over all effects destined for pious purposes, over all mosques, hospitals, colleges, sepulchres, and monasteries. He disposes of all ecclesiastical employments, and nominates all the superiors of religious houses. His decisions in matters of religion are received as so many infallible oracles; he judges of all criminal matters in his own house without appeal. His authority is balanced by that of the mudsitehid, or first theologue of the empire.

SEDUCTION, is the act of tempting and drawing aside from the right path, and comprehends every endeavour to corrupt any individual of the human race. This is the import of the word in its largest and most general sense; but it is commonly employed to express the act of tempting a virtuous woman to part with her chastity.

The *seducer* of female innocence practises the same stratagems of fraud to get possession of a woman's person, that the *swindler* employs to get possession of his neighbour's goods or money; yet the law of honour, which pretends to abhor *deceit*, and which impels its votaries to *murder* every man who presumes, however justly, to suspect them of fraud, or to question their veracity, applauds the address of a successful intrigue, though it be well known that the seducer could not have obtained his end without swearing to the truth of a thousand falsehoods, and calling upon God to witness promises which he never meant to fulfil.

The law of honour is indeed a very capricious rule, which accommodates itself to the pleasures and conveniences of higher life; but the law of the land, which is enacted for the equal protection of high and low, may be supposed to view the guilt of seduction with a more impartial eye. Yet for this offence, even the laws of this kingdom have provided no other punishment than a pecuniary satisfaction to the injured family; which, in England, can be obtained only by one of the quaintest fictions in the world, by the father's bringing his action against the seducer for the loss of his daughter's service during her pregnancy and nurturing. See Paley's *Moral Philosophy*, Book III. Part III. Chap. 3.

The moralist, however, who estimates the merit or demerit of actions, not by laws of human appointment, but by their general consequences as established by the laws of nature, must consider the seducer as a criminal

of

Seduction. of the deepest guilt. In every civilized country, and in many countries where civilization has made but small progress, the virtue of women is collected as it were into a single point, which they are to guard above all things, as that on which their happiness and reputation wholly depend. At first sight this may appear a capricious regulation; but a moment's reflection will convince us of the contrary. In the married state so much confidence is necessarily reposed in the fidelity of women to the beds of their husbands, and evils so great result from the violation of that fidelity, that whatever contributes in any degree to its preservation, must be agreeable to him who, in establishing the laws of nature, intended them to be subservient to the real happiness of all his creatures. But nothing contributes so much to preserve the fidelity of wives to their husbands, as the impressing upon the minds of women the highest veneration for the virtue of chastity. She who, when unmarried, has been accustomed to grant favours to different men, will not find it easy, if indeed possible, to resist afterwards the allurements of variety. It is therefore a wise institution, and agreeable to the will of Him who made us, to train up women so as that they may look upon the loss of their chastity as the most disgraceful of all crimes; as that which sinks them in the order of society, and robs them of all their value. In this light virtuous women actually look upon the loss of chastity. The importance of that virtue has been so deeply impressed upon their minds, and is so closely associated with the principle of honour, that they cannot think but with abhorrence upon the very deed by which it is lost. He therefore who by fraud and falsehood persuades the unsuspecting girl to deviate in one instance from the honour of the sex, weakens in a great degree her moral principle; and if he reconcile her to a repetition of her crime, he destroys that principle entirely, as she has been taught to consider all other virtues as inferior to that of chastity. Hence it is that the hearts of prostitutes are generally steeled against the miseries of their fellow-creatures; that they lend their aid to the seducer in his practices upon other girls; that they lie and swear and steal without compunction; and that too many of them hesitate not to commit murder if it can serve any selfish purpose of their own.

The loss of virtue, though the greatest that man or woman can sustain, is not the only injury which the seducer brings upon the girl whom he deceives. She cannot at once reconcile herself to prostitution, or even to the loss of character; and while a sense of shame remains in her mind, the misery which she suffers must be exquisite. She knows that she has forfeited what in the female character is most valued by both sexes; and she must be under the perpetual dread of a discovery. She cannot even confide in the honour of her seducer, who may reveal her secret in a fit of drunkenness, and thus rob her of her fame as well as of her virtue; and while she is in this state of anxious uncertainty, the agony of her mind must be insupportable. That it is so in fact, the many instances of child-murder by unmarried women of every rank leave us no room to doubt. The affection of a mother to her new-born child is one of the most unequivocal and strongest instincts in human nature (see Instinct); and nothing short of the extremity of distress could prompt any one so far to oppose her nature as to embrue her hands in the blood of her imploring infant. Seduction.

Even this deed of horror seldom prevents a detection of the mother's frailty, which is indeed commonly discovered, though no child has been the consequence of her intrigue. He who can seduce is base enough to betray; and no woman can part with her honour, and retain any well-grounded hope that her amour shall be kept secret. The villain to whom she surrendered will glory in his victory, if it was with difficulty obtained; and if she surrendered at discretion, her own behaviour will reveal her secret. Her reputation is then irretrievably lost, and no future circumspection will be of the smallest avail to recover it. She will be shunned by the virtuous part of her own sex, and treated as a mere instrument of pleasure by the other. In such circumstances she cannot expect to be married with advantage. She may perhaps be able to captivate the heart of a heedless youth, and prevail upon him to unite his fate to her's before the delirium of his passion shall give him time for reflection; she may be addressed by a man who is a stranger to her story, and married while he has no suspicion of her secret; or she may be solicited by one of a station inferior to her own, who, though acquainted with every thing that has befallen her, can barter the delicacy of wedded love for some pecuniary advantage; but from none of these marriages can she look for happiness. The delirium which prompted the first will soon vanish, and leave the husband to the bitterness of his own reflections, which can hardly fail to produce cruelty to the wife. Of the secret, to which, in the second case, the lover was a stranger, the husband will soon make a discovery, or at least find room for harbouring strong suspicions; and suspicions of having been deceived in a point so delicate have hitherto been uniformly the parents of misery. In the third case, the man married her merely for money, of which having got the possession, he has no farther inducement to treat her with respect. Such are some of the consequences of seduction, even when the person seduced has the good fortune to get afterwards a husband; but this is a fortune which few in her circumstances can reasonably expect. By far the greater part of those who have been defrauded of their virtue by the arts of the seducer sink deeper and deeper into guilt, till they become at last common prostitutes. The public is then deprived of their service as wives and parents; and instead of contributing to the population of the state, and to the sum of domestic felicity, these outcasts of society become seducers in their turn, corrupting the morals of every young man whose appetites they can inflame, and of every young woman whom they can entice to their own practices.

All this complication of evil is produced at first by arts, which, if employed to deprive a man of his property, would subject the offender to the execration of his fellow-subjects, and to an ignominious death: but while the forger of a bill is pursued with relentless rigour by the ministers of justice, and the swindler loaded with universal reproach, the man who by fraud and forgery has enticed an innocent girl to gratify his desires at the expence of her virtue, and thus introduced her into a path which must infallibly lead to her own ruin, as well as to repeated injuries to the public at

 large,

Seduction. Sedum.

barge, is not despised by his own sex, and is too often caressed even by the virtuous part of the other. Yet the loss of property may be easily repaired; the loss of honour is irreparable! It is vain to plead in alleviation of this guilt, that women should be on their guard against the arts of the seducer. Most unquestionably they should; but arts have been used which hardly any degree of caution would have been sufficient to counteract. It may as well be said that the trader should be on his guard against the arts of the forger, and accept of no bill without previously consulting him in whose name it is written. Cases, indeed, occur in trade, in which this caution would be impossible; but he must be little acquainted with the workings of the human heart, who does not know that situations likewise occur in life, in which it is equally impossible for a girl of virtue and tenderness to resist the arts of the man who has completely gained her affections.

The mentioning of this circumstance leads us to consider another species of seduction, which, though not so highly criminal as the former, is yet far removed from innocence; we mean the practice which is too prevalent among young men of fortune of employing every art in their power to gain the hearts of headless girls whom they resolve neither to marry nor to rob of their honour. Should a man adhere to the latter part of this resolution, which is more than common fortitude can always promise for itself, the injury which he does to the object of his amusement is yet very great, as he raises hopes of the most sanguine kind merely to disappoint them, and diverts her affections perhaps for ever from such men as, had they been fixed on one of them, might have rendered her completely happy. Disappointments of this kind have sometimes been fatal to the unhappy girl; and even when they have neither deprived her of life, nor disordered her reason, they have often kept her wholly from marriage, which, whatever it be to a man, is that from which every woman expects her chief happiness. We cannot therefore conclude this article more properly than with warning our female readers not to give up their hearts hastily to men whose station in life is much higher than their own; and we beg leave to assure every one of them, that the man who solicits the last favour under the most solemn promise of a subsequent marriage, is a base seducer, who prefers a momentary gratification of his own to her honour and happiness through life, and has no intention to fulfil his promise. Or, if he should by any means be compelled to fulfil it, she may depend upon much ill treatment in return for her premature compliance with his base desires.

SEDUM, ORPINE, in botany: A genus of the pentagynia order, belonging to the decandria class of plants; and in the natural method ranking under the 13th order, *Succulentæ*. The calyx is quinquefid; the corolla is pentapetalous, pointed, and spreading; there are five nectariferous squamæ or scales at the base of the germen. The capsules are five.

The species are 20 in number. 1. The Verticillatum; 2. Telephium; 3. Anacampseros; 4. Aizoon; 5. Hybridum; 6. Populifolium; 7. Stellatum; 8. Cepæa; 9. Libanoticum; 10. Dasyphyllum; 11. Reflexum; 12. Rupestre; 13. Lineare; 14. Hispanicum; 15. Album; 16. Acre; 17. Sexangulare; 18. Annuum; 19. Villosum; 20. Atratum. The following species are the most remarkable.

1. The telephium, common orpine, or live-long, hath a perennial root, composed of many knobbed tubercles, sending up erect, round, succulent stalks, branching half a yard or two feet high, garnished with oblong, plane, serrated, succulent leaves, and the stalks terminated by a leafy corymbus of flowers, of different colours in the varieties. This species is an inhabitant of woods and dry places in England, &c. but has been long a resident of gardens for variety and medical use. 2. The anacampseros, or decumbent evergreen Italian orpine, hath a fibrous perennial root, decumbent or trailing stalks, wedge-shaped entire leaves, and the stalks terminated by a corymbus of purple flowers. 3. The rupestre, rock sedum, or stone-crop of St Vincent's rock, hath slender, trailing, purple stalks; short, thick, awl-shaped, succulent, glaucous leaves in clusters, quinquefariously imbricated round the stalks, and the stalks terminated by roundish cymous bunches of bright yellow flowers. It grows naturally on St Vincent's rock near Bristol, and other rocky places in Europe. 4. The aizoon, or Siberian yellow orpine, hath a tuberculate, fibrous, perennial root; many upright, round, succulent stalks, a foot high; lanceolated, plane, serrated, thickish leaves; and the stalks terminated by a close-sitting cymose cluster of bright yellow flowers. 5. The reflexum, reflexed small yellow sedum, or prick-madam, hath a slender fibrous perennial root; small trailing succulent stalks, garnished with thick, awl-shaped, succulent leaves sparsedly, the lower ones recurved, and the stalks terminated by reflexed spikes of bright yellow flowers. It grows naturally on old walls and buildings in England, &c. 6. The acre, acrid sedum, common stone-crop of the wall, or wall-pepper, hath small fibry roots, very slender succulent stalks four or five inches high, very small, suboval, gibbous, erect, alternate leaves, close together, and the stalks terminated by trifid cymose bunches of small yellow flowers. This sort grows abundantly on rocks, old walls, and tops of buildings, almost everywhere, which often appear covered with the flowers in summer. 7. The sexangulare, or sexangular stone-crop, hath a fibry perennial root; thick, short, succulent stalks; small, suboval, gibbous, erect leaves close together, arranged six ways imbricatim, and the stalks terminated by bunches of yellow flowers. It grows on rocky and other dry places in England, &c. 8. The album, or white stone-crop, hath fibry perennial roots; trailing slender stalks, six or eight inches long; oblong, obtuse, sessile, spreading leaves; and the stalks terminated by branchy cymose bunches of white flowers. This grows on old walls, rocks, and buildings, in England, &c. 9. The hispanicum, or Spanish sedum, hath fibrous perennial roots, crowned with clusters of taper, acute, succulent leaves; slender succulent stalks, four or five inches high, garnished also with taper leaves, and terminated by downy cymose clusters of white flowers.

All these species of sedum are hardy herbaceous succulent perennials, durable in root, but mostly annual in stalk, &c. which, rising in spring, flower in June, July, and August, in different sorts; the flowers consisting universally of five spreading petals, generally crowning the stalks numerously in corymbose and cymose bunches and spikes, appearing tolerably conspicuous, and are succeeded

Seed ‖ Seeks.

ſucceeded by plenty of ſeeds in autumn, by which they may be propagated alſo abundantly by parting the roots, and by ſlips or cuttings of the ſtalks in ſummer; in all of which methods they readily grow and ſpread very faſt with tufted bunches; being all of ſucculent growth, they conſequently delight moſt in dry ſoils, or in any dry rubbiſh earth.

Uſes. As flowering plants, they are moſtly employed to embelliſh rock-work, ruins, and the like places, planting either the roots or cuttings of the ſhoots in a little mud or any moiſt ſoil at firſt, placing it in the crevices, where they will ſoon root and fix themſelves, and ſpread about very agreeably. For economical purpoſes, the reflexom and rupeſtre are cultivated in Holland and Germany, to mix with lettuce in ſalads. The wall pepper is ſo acrid, that it bliſters the ſkin when applied externally. Taken inwardly, it excites vomiting. In ſcorbutic caſes and quartan agues, it is ſaid to be an excellent medicine under proper management. Goats eat it: cows, horſes, ſheep, and ſwine, refuſe it.

SEED, in phyſiology, a ſubſtance prepared by nature for the reproduction and conſervation of the ſpecies both in animals and plants. See BOTANY, Sect. IV. p. 435.; and PHYSIOLOGY, Sect. XII.

SEEDLINGS, among gardeners, denote ſuch roots of gilliflowers, &c. as come from ſeed ſown. Alſo the young tender ſhoots of any plants, that are newly ſown.

SEEDY, in the brandy trade, a term uſed by the dealers to denote a fault that is found in ſeveral parcels of French brandy, which renders them unſaleable. The French ſuppoſe that theſe brandies obtain the flavour which they expreſs by this name, from weeds that grow among the vines from whence the wine of which this brandy is preſſed was made.

SEEING, the perceiving of external objects by means of the eye. For an account of the organs of ſight, and the nature of viſion, ſee ANATOMY, Sect. VI. and OPTICS, page 292, *et ſeq.*

SEEKS, a religious ſect ſettled at Patna, and ſo called from a word contained in one of the commandments of their founder, which ſignifies *learn thou.* In books giving an account of oriental ſects and oriental cuſtoms, we find mention made both of *Seeks* and *Seiks;* and we are ſtrongly inclined to think that the ſame tribe is meant to be denominated by both words. If ſo, different authors write very differently of their principles and manners. We have already related what we then knew of the *Seiks* under the article HINDOOS, p. 530; but in the Aſiatic Reſearches, Mr Wilkins gives a much more amiable account of the *Seeks,* which we lay before our readers with pleaſure.

The Seeks are a ſect diſtinguiſhed both from the Muſſolmans and the worſhippers of Brahma; and, from our author's account of them, muſt be an amiable people. He aſked leave to enter into their chapel: They ſaid it was a place of worſhip, open to all men, but intimated that he muſt take off his ſhoes. On complying with this ceremony, he was politely conducted into the hall, and ſeated upon a carpet in the midſt of the aſſembly. The whole building forms a ſquare of about 40 feet. The hall is in the centre, divided from four other apartments by wooden arches, upon pillars of the ſame materials. The walls above the arches were hung with European looking-glaſſes in gilt frames, and with pictures. On the left hand, as one enters, is the chancel, which is furniſhed with an altar covered with cloth of gold, raiſed a little above the ground in a declining poſition. About it were ſeveral flower-pots and roſe-water bottles, and three urns to receive the donations of the charitable. On a low deſk, near the altar, ſtood a great book of folio ſize, from which ſome portions are daily read in the divine ſervice. When notice was given that it was *noon,* the congregation arranged themſelves upon the carpet on each ſide of the hall. The great book and deſk were brought from the altar, and placed at the oppoſite extremity. An old ſilver-haired man kneeled down before the deſk, with his face towards the altar, and by him ſat a man with a drum, and two or three with cymbals. The book was now opened, and the old man began to chant to the time of the inſtruments, and at the concluſion of every verſe moſt of the congregation joined chorus in a reſponſe, with countenances exhibiting great marks of joy. Their tones were not harſh; the time was quick; and Mr Wilkins learned that the ſubject was a hymn in praiſe of the unity, omnipreſence, and omnipotence of the Deity. The hymn concluded, the whole company got up and preſented their faces with joined hands, towards the altar in the attitude of prayer. The prayer was a ſort of litany pronounced by a young man in a loud and diſtinct voice; the people joining, at certain periods, in a general reſponſe. This prayer was followed by a ſhort bleſſing from the old man, and an invitation to the aſſembly to partake of a friendly feaſt. A ſhare was offered to Mr Wilkins, who was too polite to refuſe it. It was a kind of ſweetmeat compoſed of ſugar and flower mixed up with clarified butter. They were next ſerved with a few ſugar plums; and thus ended the feaſt and ceremony.

In the courſe of converſation Mr Wilkins learned that the founder of this ſect was *Naneek Sah,* who lived about 400 years ago; who left behind him a book, compoſed by himſelf in verſe, containing the doctrines he had eſtabliſhed; that this book teaches, that there is but one God, filling all ſpace, and pervading all matter; and that there will be a day of retribution, when virtue will be rewarded, and vice puniſhed. (Our author forgot to aſk in what manner.) It forbids murder, theft, and ſuch other deeds as are by the majority of mankind eſteemed crimes, and inculcates the practice of all the virtues; but, particularly, a univerſal philanthropy and hoſpitality to ſtrangers and travellers. It not only commands univerſal toleration, but forbids diſputes with thoſe of another perſuaſion. If any one ſhow a ſincere inclination to be admitted among them, any five or more Seeks being aſſembled in any place, even on the highway, they ſend to the firſt ſhop where ſweetmeats are ſold, and procure a very ſmall quantity of a particular kind called *batāſā* (Mr Wilkins does not tell us of what it is compoſed), which having diluted in pure water, they ſprinkle ſome of it on the body and eyes of the proſelyte, whilſt one of the beſt inſtructed repeats to him the chief canons of their faith, and exacts from him a ſolemn promiſe to abide by them the reſt of his life. They offered to admit Mr Wilkins into their ſociety; but he declined the honour, contenting himſelf with their alphabet, which they told him to guard as the apple of his eye, as it was a ſacred character. Mr Wilkins finds it but a little different from the Dewadgari.

The language itself is a mixture of Persian, Arabic, and Shanscrit, grafted upon the provincial dialect of Punjab, which is a kind of Hindowee, or, as we commonly call it, *Moors*.

SEGEBERG, a town of Germany, in the duchy of Holstein, and in Wagria; with a castle standing on a high mountain, consisting of limestone, large quantities of which are carried to Hamburg and Lubec. It belongs to Denmark, and is seated on the river Treve, in E. Long. 10. 9. N. Lat. 54. 0.

SEGEDIN, a strong town of Lower Hungary, in the county of Czongrad, with a castle. The Imperialists took it from the Turks in 1686. It is seated at the confluence of the rivers Tesse and Masioch, in E. Long. 20. 35. N. Lat. 46. 28.

SEGMENT *of a* CIRCLE, in geometry, is that part of the circle contained between a chord and an arch of the same circle.

SEGNA, a city of Croatia, belonging to the house of Austria, and seated on the coast of the gulf of Venice. It was formerly a place of strength and great importance; but it has suffered many calamities, and its inhabitants at present do not amount to 7000. In the beginning of this century it sent 50 merchant ships to sea; but the inconveniency of its situation and badness of its harbour, in which the sea is never calm, discouraged navigation, and Segna has now very few ships belonging to it. Among the customs of the Segnans, Mr Fortis mentions one relative to the dead, which for its singularity may be worthy of notice.

Fortis's Travels into Dalmatia.

"All the relations and friends of the family go to kiss the corpse, by way of taking leave, before burial. Each of them uncovers the face, over which a handkerchief is spread, more or less rich according to the family; having kissed the dead person, every one throws another handkerchief over the face; all which remain to the heirs, and sometimes there are 20, 30, and more at this ceremony. Some throw all these handkerchiefs into the grave with the corpse; and this, in former times, was the general custom; but then they were rich. This seems to have been brought into use as a substitute for the ancient *vasa lachrymatoria.*" E. Long. 15. 21. N. Lat. 45. 22.

SEGNI, an ancient town of Italy, in the Campagna of Rome, with a bishop's see, and the title of duchy. It is said that organs were first invented here. It is seated on a mountain. E. Long. 13. 15. N. Lat. 41. 50.

SEGORBE, a town of Spain, in the kingdom of Valencia, with the title of a duchy, and a bishop's see. It is seated on the side of a hill, between the mountains, in a soil very fertile in corn and wine, and where there are quarries of fine marble. It was taken from the Moors in 1245; and the Romans thought it worth their while to carry some of the marble to Rome. W. Long. 0. 3. N. Lat. 39. 48.

SEGOVIA, an ancient city of Spain, of great power in the time of the Cæsars, is built upon two hills near the banks of the Arayda in Old Castile. W. Long. 3. 48. N. Lat. 41. 0. It is still a bishop's see, and is distinguished for some venerable remains of antiquity. In the year 1525 the city contained 5000 families, but now they do not surpass 2000, a scanty population for 25 parishes; yet, besides 21 churches and a cathedral, there are 21 convents.

The first object in Segovia that attracts the eye is the aqueduct, which the singular situation of the city renders necessary. As it is built upon two hills, and the valley by which they are separated, and extends considerably in every direction, it was difficult for a part of the citizens to be supplied with water. The difficulty was removed, according to the opinion of the learned, in the reign of Trajan, by this aqueduct, which is one of the most astonishing and the best preserved of the Roman works. In the opinion of Mr Swinburne, who surveyed it in 1776, and who seems to have given a very accurate account of the curiosities of Segovia, it is superior in elegance of proportion to the Pont du Gard at Nismes. It is so perfectly well preserved, that it does not seem leaky in any part. From the first low arches to the reservoir in the town, its length is 2400 Spanish feet; its greatest height (in the Plaza del Azobejo at the foot of the walls) is 104; it is there composed of a double row of arches, built of large square stones without mortar, and over them a hollow wall of coarser materials for the channel of the water, covered with large oblong flags. Of the lower range of arcades, which are 15 feet wide by 65 high, there are 42. The upper arches are 119 in number, their height 27 Spanish feet, their breadth seventeen, the transversal thickness, or depth of the piers, eight feet.

Swinburne's Travels through Spain.

The cathedral is a mixture of the Gothic and Moorish architecture. The inside is very spacious and of majestic simplicity. The windows are well disposed, and the great altar has been lately decorated with the finest Grenadian marble. But it is to be regretted, that in this cathedral, as well as in most others of Spain, the choir is placed in the middle of the nave. The church is nearly upon the model of the great church of Salamanca, but it is not so highly finished.

Travels in Spain by the Chev. de Bourgoanne.

The alcazar, or ancient palace of the Moors, stands in one of the finest positions possible, on a rock rising above the open country. A very pretty river washes the foot of the precipice, and the city lies admirably well on each side on the brow of the hill; the declivity is woody, and the banks charmingly rural; the snowy mountains and dark forests of Saint Ildefonzo compose an awful back ground to the picture. Towards the town there is a large court before the great outward tower, which, as the prison of Gil Blas, is so well described by Le Sage, that the subject requires no farther explanation. The rest of the buildings form an antique palace, which has seldom been inhabited by any but prisoners since the reign of Ferdinand and Isabella, who were much attached to this situation. There are some magnificent halls in it, with much gilding in the ceilings, in a semi-barbarous taste. All the kings of Spain are seated in state along the cornice of the great saloon; but it is doubtful whether they are like the princes whose names they bear; if that resemblance, however, be wanting, they have no other merit to claim. The royal apartments are now occupied by a college of young gentlemen cadets, educated at the king's expence in all the sciences requisite for forming an engineer. The grand-master of the ordnance resides at Segovia, which is the head establishment of the Spanish artillery.

The mint is below the alcazar, a large building, the most ancient place of coinage in the kingdom. The machines for melting, stamping, and milling the coin, are worked by water: but there is reason to believe that

Segovia || Sejant.

that Seville has at present more business, as being nearer the source of riches, the port of Cadiz, where the ingots of America are landed.

The unevenness of the crown of the hill gives a wild look to this city. Most of the streets are crooked and dirty, the houses wooden and very wretched; nor do the inhabitants appear much the richer for their cloth manufactory. Indeed, it is not in a very flourishing condition, but what cloth they make is very fine.

The country about Segovia has the reputation of being the best for rearing the kind of sheep that produces the beautiful Spanish wool; but as those flocks wander over many other parts of the kingdom, Segovia seems to have no exclusive title to this reputation. Segovia (says Mr Townsend, whose valuable travels will be read with much pleasure) was once famous for its cloth made on the king's account; but other nations have since become rivals in this branch, and the manufacture in this city has been gradually declining. When the king gave it up to a private company, he left about 3000l. in trade; but now he is no longer a partner in the business. In the year 1612 were made here 25,500 pieces of cloth, which consumed 44,625 quintals of wool, employed 34,189 persons; but at present they make only about 4000 pieces. The principal imperfections of this cloth are, that the thread is not even, and that much grease remains in it when it is delivered to the dyer; in consequence of which the colour is apt to fail. Yet, independently of imperfections, so many are the disadvantages under which the manufacture labours, that foreigners can afford to pay 3l. for the arroba of fine wool, for which the Spaniard gives no more than 20 shillings, and after all his charges can command the market even in the ports of Spain.

Townsend's Journey through Spain.

Segovia (New), a town of North America, in New Spain, and in the audience of Guatimala; seated on the river Yare, on the confines of the province of Honduras. W. Long. 84. 30. N. Lat. 13. 25.

Segovia, a town of America, in Terra Firma, and in the province of Venezuela, seated on a river, near a very high mountain, where there are mines of gold. W. Long. 65. 30. N. Lat. 8. 20.

Segovia, a town of Asia, in the island of Manila, and one of the largest of the Philippines, seated at the north end of the island, 240 miles north of Manila, and subject to Spain. E. Long. 120. 59. N. Lat. 18. 36.

SEGREANT, is the herald's word for a griffin when drawn in a leaping posture and displaying his wings as if ready to fly.

SEGUE, in the Italian music, is often found before *aria, alleluja, amen*, &c. to show that those portions or parts are to be sung immediately after the last note of that part over which it is writ; but if these words *si placet*, or *ad libitum*, are joined therewith, it signifies, that these portions may be sung or not at pleasure.

SEGUIERIA, in botany; a plant belonging to the class of polyandria, and the order of monogynia. The calyx is pentaphyllous; the phylla are oblong, concave, coloured, and permanent; there is no corolla. The capsule is oblong and monospermous, the large ala terminating in small lateral alæ. There is only one species, the *americana*.

SEJANT, a term used in heraldry, when a lion, or other beast, is drawn in an escutcheon sitting like a cat with his fore-feet straight.

SEJANUS (Ælius), a native of Vulsinum in Tuscany, who distinguished himself in the court of Tiberius. His father's name was Seius Strabo; a Roman knight, commander of the pretorian guards. His mother was descended from the Junian family. Sejanus first gained the favours of Caius Cæsar, the grandson of Augustus, but afterwards he attached himself to the interest and the views of Tiberius, who then sat on the imperial throne. The emperor, who was naturally of a suspicious temper, was free and open with Sejanus, and while he distrusted others, he communicated his greatest secrets to this fawning favourite. Sejanus improved this confidence; and when he had found that he possessed the esteem of Tiberius, he next endeavoured to become the favourite of the soldiers, and the darling of the senate. As commander of the pretorian guards he was the second man in Rome, and in that important office he made use of insinuations and every mean artifice to make himself beloved and revered. His affability and condescension gained him the hearts of the common soldiers, and, by appointing his own favourites and adherents to places of trust and honour, all the officers and centurions of the army became devoted to his interest. The views of Sejanus in this were well known; yet, to advance with more success, he attempted to gain the affection of the senators. In this he met with no opposition. A man who has the disposal of places of honour and dignity, and who has the command of the public money, cannot but be the favourite of those who are in need of his assistance. It is even said, that Sejanus gained to his views all the wives of the senators, by a private and most secret promise of marriage to each of them, whenever he had made himself independent and sovereign of Rome. Yet, however successful with the best and noblest families in the empire, Sejanus had to combat numbers in the house of the emperor; but these seeming obstacles were soon removed. All the children and grandchildren of Tiberius were sacrificed to the ambition of the favourite under various pretences; and Drusus the son of the emperor, by striking Sejanus, made his destruction sure and inevitable. Livia, the wife of Drusus, was gained by Sejanus; and, though the mother of many children, she was prevailed upon to assist her adulterer in the murderer of her husband, and she consented to marry him when Drusus was dead. No sooner was Drusus poisoned, than Sejanus openly declared his wish to marry Livia. This was strongly opposed by Tiberius; and the emperor, by recommending Germanicus to the senators for his successor, rendered Sejanus bold and determined. He was more urgent in his demands; and when he could not gain the consent of the emperor, he persuaded him to retire to solitude from the noise of Rome and the troubles of the government. Tiberius, naturally fond of ease and luxury, yielded to his representations, and retired to Campania, leaving Sejanus at the head of the empire. This was highly gratifying to the favourite, but he was not without a master. Prudence and moderation might have made him what he wished to be; but having offended the emperor beyond forgiveness, he resolved to retrieve his loss, and by one vigorous effort to decide the fate of the empire. He called together his friends and followers; he paid court

Sejanus.

Lempriere's Dictionary.

Sejanus. court to such as seemed disaffected; he held forth rewards and promises; and, having increased the number of his partisans, formed a bold conspiracy, resolved by any means to seize the sovereign power.

A powerful league was formed with astonishing rapidity, and great numbers of all descriptions, senators as well as military men, entered into the plot. Among these, Satrius Secundus was the confidential friend and prime agent of the minister. Whatever was this man's motive, whether fear, or views of interest, or ingratitude (for no principle of honour can be imputed to him), he resolved to betray the secret to Tiberius. For this purpose he addressed himself to Antonia, the daughter of Anthony the triumvir, the widow of Drusus, and the mother of Germanicus. When this illustrious woman, who was honoured by the court and revered by the people, heard the particulars, she sent despatches to the emperor by one of her slaves. Tiberius was astonished, but not dismayed. The danger pressed; his habitual slowness was out of season; the time called for vigour and decisive measures. He sent Macro to Rome, with a special commission to take upon him the command of the prætorian guards. He added full instructions for his conduct in all emergencies. Early in the morning on the 15th, before the kalends of November, a report was spread, that letters had arrived at Rome, in which the emperor signified his intention to associate Sejanus with himself in the tribunitian power. The senate was summoned to meet in the temple of Apollo, near the imperial palace. Sejanus attended without delay. A party of the prætorians followed him. Macro met him in the vestibule of the temple. He approached the minister with all demonstrations of profound respect, and taking him aside, "Be not surprised (he said) that you have no letter from the prince: it is his pleasure to declare you his colleague in the tribunitian power; but he thinks that a matter of so much importance should be communicated to the fathers by the voice of the consuls. I am going to deliver the emperor's orders. Sejanus, elated with joy, and flushed with his new dignity, entered the senate house; Macro followed him. As soon as the consuls arrived, he delivered the letter from Tiberius, and immediately went forth to the prætorian guards. He informed them, that by order of the prince, a large donative was to be distributed among the soldiers. He added, that, by a new commission, he himself was appointed their commanding officer; and, if they followed him to the camp, they would there received the promised bounty. The lure was not thrown out in vain: the prætorian guards quitted their station. Laco, who stood near at hand, immediately surrounded the senate house with a body of the city cohorts.

Murphy's Tacitus, Book V.

The letter to the consuls was confused, obscure, and tedious, only glancing at Sejanus, till at last the language of invective left no room for doubt. Sejanus kept his seat like a man benumbed, senseless and stupid with astonishment. His friends, who a little before congratulated him on his new dignity, deserted him on every side. He was commanded by the consul to rise and follow him, and being loaded with irons, was conducted to prison. His downfal filled the city with exultation. The populace, who worshipped him in the hour of prosperity, rejoiced to see the sad catastrophe to which he was now reduced. They followed in crowds, rending the air with shouts, and pouring forth a torrent of abuse and scurrilous language. The prisoner endeavoured to hide his face; but the mob delighted to see remorse and shame and guilt and horror in every feature of his distracted countenance. They reviled him for his acts of cruelty; they laughed at his wild ambition; they tore down his images, and dashed his statues to pieces. He was doomed by Tiberius to suffer death on that very day; but, as he had a powerful faction in the senate, it was not thought advisable, for the mere formality of a regular condemnation, to hazard a debate. Private orders were given to Macro to despatch him without delay; but the consul, seeing the dispositions of the people, and the calm neutrality of the prætorian guards, judged it best to re-assemble the fathers. They met in the temple of Concord. With one voice Sejanus was condemned to die, and the sentence was executed without delay. He was strangled in the prison. His body was dragged to the Gemoniæ, and, after every species of insult from the populace, at the end of three days was thrown into the Tiber. Such was the tragic end of that ambitious favourite. He fell a terrible example to all, who, in any age or country, may hereafter endeavour by their vices to rise above their fellow citizens.

Seignior ‖ Seisin.

SEIGNIOR, is, in its general signification, the same with *lord*; but is particularly used for the lord of the fee as of a manor, as *seigneur* among the feudists is he who grants a fee or benefit out of the land to another; and the reason is, because having granted away the use and profit of the land, the property or dominion he still retains in himself.

SEIGNIORAGE, is a royalty or prerogative of the king, whereby he claims an allowance of gold and silver bought in the mass to be exchanged for coin. As seigniorage, out of every pound weight of gold, the king had for his coin 5s. of which he paid to the master of the mint sometimes 1s. and sometimes 1s. 6d. Upon every pound weight of silver, the seigniorage answered to the king in the time of Edward III. was 18 pennyweights, which then amounted to about 1s. out of which he sometimes paid 8d. at others 9d. to the master. In the reign of King Henry V. the king's seigniorage of every pound of silver was 15d. &c.

SEIGNIORY, is borrowed from the French *seigneure*, i. e. *dominatus, imperium, principatus*; and signifies with us a manor or lordship, *seigniory de sokemans*. *Seigniory in gross*, seems to be the title of him who is not lord by means of any manor, but immediately in his own person; as *tenure in capite*, whereby one holds of the king as of his crown, is *segniory in gross*.

SEIKS. See HINDOSTAN, p. 530.

SEISIN, in law, signifies possession. In this sense we, say, *premier seisin*, for the first possession, &c.

Seisin is divided into that *in deed* or *in fact*, and that *in law*. A seisin *deed* is where a possession is actually taken: but a seisin in *law* is, where lands descend, and the party has not entered thereon; or in other words, it is where a person has a right to lands, &c. and is by wrong disseised of them. A seisin in law is held to be sufficient to avow on; though to the bringing of an assize, actual seisin is required; and where seisin is alleged, the person pleading it must show of what estate he is seised, &c.

Seisin of a superior service is deemed to be a seisin of

of all superior and casual services that are incident thereto; and seisin of a lessee for years, is sufficient for him in reversion.

Livery of Seisin, in law, an essential ceremony in the conveyance of landed property; being no other than the pure feodal investiture, or delivery of corporal possession of the land or tenement. This was held absolutely necessary to complete the donation; *Nam feudum sine investitura nullo modo constitui potuit*: and an estate was then only perfect when, as Fleta expresses it in our law, *fit juris et seisinæ conjunctio*. See FEOFMENT.

Investitures, in their original rise, were probably intended to demonstrate in conquered countries the actual possession of the lord; and that he did not grant a bare litigious right, which the soldier was ill qualified to prosecute, but a peaceable and firm possession. And, at a time when writing was seldom practised, a mere oral gift, at a distance from the spot that was given, was not likely to be either long or accurately retained in the memory of bystanders, who were very little interested in the grant. Afterwards they were retained as a public and notorious act, that the country might take notice of and testify the transfer of the estate; and that such as claimed title by other means might know against whom to bring their actions.

In all well-governed nations, some notoriety of this kind has been ever held requisite, in order to acquire and ascertain the property of lands. In the Roman law, *plenum dominium* was not said to subsist unless where a man had both the *right* and the *corporal possession*; which possession could not be acquired without both an actual intention to possess, and an actual seisin, or entry into the premises, or part of them, in the name of the whole. And even in ecclesiastical promotions, where the freehold passes to the person promoted, corporal possession is required at this day to vest the property completely in the new proprietor; who, according to the distinction of the canonists, acquires the *jus ad rem*, or inchoate and imperfect right, by nomination and institution; but not the *jus in re*, or complete and full right, unless by corporal possession. Therefore in dignities possession is given by instalment; in rectories and vicarages by induction; without which no temporal rights accrue to the minister, though every ecclesiastical power is vested in him by institution. So also even in descents of lands, by our law, which are cast on the heir by act of the law itself, the heir has not *plenum dominium*, or full and complete ownership, till he has made an actual corporal entry into the lands: for if he dies before *entry* made, *his* heir shall not be entitled to take the possession, but the heir of the person who was last actually seised. It is not therefore only a mere right to enter, but the actual entry, that makes a man complete owner; so as to transmit the inheritance to his own heirs: *non jus, sed seisina, facit stipitem*.

Yet the corporal tradition of lands being sometimes inconvenient, a symbolical delivery of possession was in many cases anciently allowed; by transferring something near at hand, in the presence of credible witnesses, which by agreement should serve to represent the very thing designed to be conveyed; and an occupancy of this sign or symbol was permitted as equivalent to occupancy of the land itself. Among the Jews we find the evidence of a purchase thus defined in the book of Ruth: "Now this was the manner in former time in Israel, concerning redeeming and concerning changing, for to confirm all things: a man plucked off his shoe, and gave it to his neighbour; and this was a testimony in Israel." Among the ancient Goths and Swedes, contracts for the sale of lands were made in the presence of witnesses, who extended the cloak of the buyer, while the seller cast a clod of the land into it, in order to give possession; and a staff or wand was also delivered from the vender to the vendee, which passed through the hands of the witnesses. With our Saxon ancestors the delivery of a turf was a necessary solemnity to establish the conveyance of lands. And, to this day, the conveyance of our copyhold estates is usually made from the seller to the lord or his steward by delivery of a rod or verge, and then from the lord to the purchaser by re-delivery of the same in the presence of a jury of tenants.

Conveyances in writing were the last and most refined improvement. The mere delivery of possession, either actual or symbolical, depending on the ocular testimony and remembrance of the witnesses, was liable to be forgotten or misrepresented, and became frequently incapable of proof. Besides, the new occasions and necessities introduced by the advancement of commerce, required means to be devised of charging and encumbering estates, and of making them liable to a multitude of conditions and minute designations, for the purposes of raising money, without an absolute sale of the land; and sometimes the like proceedings were found useful in order to make a decent and competent provision for the numerous branches of a family, and for other domestic views. None of which could be effected by a mere, simple, corporal transfer of the soil from one man to another, which was principally calculated for conveying an absolute unlimited dominion. Written deeds were therefore introduced, in order to specify and perpetuate the peculiar purposes of the party who conveyed: yet still, for a very long series of years, they were never made use of, but in company with the more ancient and notorious method of transfer by delivery of corporal possession.

Livery of seisin, by the common law, is necessary to be made upon every grant of an estate of freehold in hereditaments corporeal, whether of inheritance or for life only. In hereditaments incorporeal it is impossible to be made; for they are not the object of the senses: and in leases for years, or other chattel interests, it is not necessary. In leases for years indeed an actual *entry* is necessary, to vest the estate in the lessee: for a bare lease gives him only a right to enter, which is called his interest in the term, or *interesse termini*: and when he enters in pursuance of that right, he is then, and not before, in possession of his term, and complete tenant for years. This entry by the tenant himself serves the purpose of notoriety, as well as livery of seisin from the granter could have done; which it would have been improper to have given in this case, because that solemnity is appropriated to the conveyance of a freehold. And this is one reason why freeholds cannot be made to commence *in futuro*, because they cannot (at the common law) be made but by livery of seisin; which livery, being an actual manual tradition of the land, must take effect *in præsenti*, or not at all.

Livery of seisin is either in *deed* or in *law*.

Seisin, Seize.

Livery in *deed* is thus performed. The feoffor, lessor, or his attorney, together with the feoffee, lessee, or his attorney, (for this may as effectually be done by deputy or attorney as by the principals themselves in person), come to the land or to the house; and there, in the presence of witnesses, declare the contents of the feoffment or lease on which livery is to be made. And then the feoffor, if it be of land, doth deliver to the feoffee, all other persons being out of the ground, a clod or turf, or a twig or bough there growing, with words to this effect: "I deliver these to you in the name of seisin of all the lands and tenements contained in this deed." But, if it be of a house, the feoffor must take the ring or latch of the door, the house being quite empty, and deliver it to the feoffee in the same form; and then the feoffee must enter alone, and shut the door, and then open it, and let in the others. If the conveyance or feoffment be of divers lands, lying scattered in one and the same county, then in the feoffor's possession, livery of seisin of any parcel, in the name of the rest, sufficeth for all; but if they be in several counties, there must be as many liveries as there are counties. For, if the title to these lands comes to be disputed, there must be as many trials as there are counties, and the jury of one county are no judges of the notoriety of a fact in another. Besides, anciently, this seisin was obliged to be delivered *coram paribus de vicineto*, before the peers or freeholders of the neighbourhood, who attested such delivery in the body or on the back of the deed; according to the rule of the feodal law, *Pares debent interesse investituræ feudi, et non alii*: for which this reason is expressly given; because the peers or vassals of the lord, being bound by their oath of fealty, will take care that no fraud be committed to his prejudice, which strangers might be apt to connive at. And though afterwards the ocular attestation of the *pares* was held unnecessary, and livery might be made before any credible witnesses, yet the trial, in case it was disputed, (like that of all other attestations), was still reserved to the *pares* or jury of the county. Also, if the lands be out on lease, though all lie in the same county, there must be as many liveries as there are tenants: because no livery can be made in this case, but by the consent of the particular tenant; and the consent of one will not bind the rest. And in all these cases it is prudent, and usual, to endorse the livery of seisin on the back of the deed, specifying the manner, place, and time of making it; together with the names of the witnesses. And thus much for livery in deed.

Livery in *law* is where the same is not made *on* the land, but *in sight of it* only; the feoffor saying to the feoffee, "I give you yonder land, enter and take possession." Here, if the feoffee enters during the life of the feoffor, it is a good livery, but not otherwise; unless he dares not enter through fear of his life or bodily harm; and then his continual claim, made yearly in due form of law, as near as possible to the lands, will suffice without an entry. This livery in law cannot, however, be given or received by attorney, but only by the parties themselves.

SEIZE, in the sea language, is to make fast or bind, particularly to fasten two ropes together with rope yarn. The seizing of a boat is a rope tied to a ring or little chain in the fore-ship of the boat, by which means it is fastened to the side of the ship.

Seizure ‖ Selden.

SEIZURE, in commerce, an arrest of some merchandise, moveable, or other matter, either in consequence of some law or of some express order of the sovereign. Contraband goods, those fraudulently entered, or landed without entering at all, or at wrong places, are subject to seizure. In seizures among us, one half goes to the informer, and the other half to the king.

SELAGO, in botany: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 48th order, *Aggregatæ*. The calyx is quinquefid: the tube of the corolla capillary, with the limb nearly equal, and a single seed. There are 22 species.

SELDEN (John), called by Grotius *the glory of England*, was born at Salvington in Sussex in 1584. He was educated at the free-school at Chichester; whence he was sent to Hart-Hall in the university of Oxford, where he staid four years. In 1612, he entered himself in Clifford's Inn, in order to study the law; and about two years after removed to the Inner Temple, where he soon acquired great reputation by his learning. He had already published several of his works; and this year wrote verses in Latin, Greek, and English, upon Mr William Browne's Britannia's Pastorals. In 1614, he published his Titles of Honour; and in 1616, his Notes on Sir John Fortescue's book *De Laudibus Legum Angliæ*. In 1618, he published his History of Tythes; which gave great offence to the clergy, and was animadverted upon by several writers; and for that book he was called before the high commission court, and obliged to make a public acknowledgment of his sorrow for having published it. In 1621, being sent for by the parliament, though he was not then a member of that house, and giving his opinion very strongly in favour of their privileges in opposition to the court, he was committed to the custody of the sheriff of London, but was set at liberty after five weeks confinement. In 1623, he was chosen burgess for Lancaster; but, amidst all the divisions of the nation, kept himself neuter, prosecuting his studies with such application, that though he was the next year chosen reader of Lyon's Inn, he refused to perform that office. In 1625, he was chosen burgess for Great Bedwin in Wiltshire, to serve in the first parliament of King Charles I. in which he declared himself warmly against the duke of Buckingham; and on his grace's being impeached by the house of commons, was appointed one of the managers of the articles against him. In 1627 and 1628, he opposed the court party with great vigour. The parliament being prorogued to January 20. 1629, Mr Selden retired to the earl of Kent's house at Wrest, in Bedfordshire, where he finished his *Marmora Arundeliana*. The parliament being met, he, among others, again distinguished himself by his zeal against the court; when the king dissolving the parliament, ordered several of the members to be brought before the King's Bench bar, and committed to the Tower. Among these was Mr Selden, who insisting on the benefit of the laws, and refusing to make his submission, was removed to the King's Bench prison. Being here in danger of his life on account of the plague then raging in Southwark, he petitioned the lord high treasurer, at the end of Trinity term, to intercede with his majesty that he might be removed to the Gate-House, Westminster, which was granted: but in Michaelmas term following, the judges objecting to the lord treasurer's warrant, by which he had

had been removed to the Gate-House, an order was made for conveying him back to the King's Bench, whence he was released in the latter end of the same year; but fifteen years after, the parliament ordered him 5000l. for the losses he had sustained on this occasion. He was afterwards committed, with several other gentlemen, for dispersing a libel; but the author, who was abroad, being discovered, they were at length set at liberty. In 1634, a dispute arising between the English and Dutch concerning the herring-fishery on the British coast, he was prevailed upon by Archbishop Laud to draw up his *Mare Clausum*, in answer to Grotius's *Mare Liberum*: which greatly recommended him to the favour of the court. In 1640, he was chosen member for the university of Oxford; when he again opposed the court, though he might, by complying, have raised himself to very considerable posts. In 1643, he was appointed one of the lay-members to sit in the assembly of divines at Westminster, and was the same year appointed keeper of the records in the Tower. Whilst he attended his duty in the assembly, a warm debate arose respecting the distance of Jericho from Jerusalem. The party which contended for the shortest distance, urged, as a proof of their opinion being well founded, that fishes were carried from the one city to the other, and sold in the market. Their adversaries were ready to yield to the force of this conclusive argument, when Selden, who despised both parties, as well as the frivolousness of their dispute, exclaimed, "Perhaps the fishes were salted!" This unexpected remark left the victory doubtful, and renewed the debate; and our author, who was sick of such trifling, soon found employment more suited to his genius; for, in 1645, he was made one of the commissioners of the admiralty. The same year he was unanimously elected master of Trinity college, Cambridge; but declined accepting. He died in 1654; and was interred in the Temple-church, where a monument is erected to his memory. Dr Wilkes observes, that he was a man of uncommon gravity and greatness of soul, averse to flattery, liberal to scholars, charitable to the poor; and though he had a great latitude in his principles with regard to ecclesiastical power, yet he had a sincere regard for the church of England. He wrote many learned works besides those already mentioned; the principal of which are, 1. *De Jure Naturali et Gentium juxta Disciplinam Hebræorum*. 2. *De Nuptiis et Divorciis*. 3. *De Anno Civili veterum Hebræorum*. 4. *De Nummis*. 5. *De Diis Syris*. 6. *Uxor Hebraica*. 7. *Jani Anglorum Facies altera*, &c. All his works were printed together in 1726 in 3 vols. folio.

SELENITES, in natural history, the name of a large class of fossils, the characters of which are these: they are bodies composed of slender and scarce visible filaments, arranged into fine, even, and thin flakes; and those disposed into regular figures, in the several different genera, approaching to a rhomboid, or hexangular column, or a rectangled parallelogram; fissile, like the talcs, but they not only lie in a horizontal, but also in a perpendicular direction: they are flexile in a small degree, but not at all elastic; they do not ferment with acid menstrua, but readily calcine in the fire. Of this class there are seven orders of bodies, and under those ten genera. The selenitæ of the first order are those composed of horizontal plates, and approaching to a rhomboidal form: of the second are those composed of horizontal plates, arranged into a columnar and angular form: of the third are those whose filaments are scarce visibly arranged into plates, but which, in the whole masses, appear rather of a striated than of a tubulated structure: of the fourth are those which are flat, but of no determinately angular figure; of the fifth are those formed of plates, perpendicularly arranged: of the sixth are those formed of congeries of plates, arranged into the figure of a star; and of the seventh are those of a complex and indeterminate figure.

Of the first of these orders there are three genera. 1. The *leptodecarhombes*. 2. The *pachodecarhombes*. 3. The *tetradecarhombes*. Of the second order there are also three genera. 1. The *ischnamblucés*. 2. The *isamblucés*. 3. The *oxuciæ*. Of the third order there is only one known genus, the *inamblucia*. Of the fourth order there is also only one known genus, the *sanidia*. Of the fifth order there is also only one known genus, the *cathetolipes*. Of the sixth order, there are two genera. 1. The *lepastra*. 2. The *trichestra*. Of the seventh order there is only one genus, the *symplexia*.

The structure of the selenitæ of all the genera of the first order is exactly alike; they are all composed of a great number of broad flakes or plates, in a great measure externally resembling the flakes of the foliaceous talcs: these are of the length and breadth of the whole mass; the top and bottom being each only one such plate, and those between them in like manner, each complete and single; and the body may always be easily and evenly split, according to the direction of these flakes. These differ, however, extremely from the talcs, for they are each composed of a number of parallel threads or filaments, which are usually disposed parallelly to the sides of the body, though sometimes parallelly to its ends. In many of the species they are also divided by parallel lines, placed at a considerable distance from each other, and the plates in splitting often break at these lines; add to this, that they are not elastic, and that they readily calcine. The structure of those of the second order is the same with that of the first; but that in many of the specimens of them the filaments of which the plates are composed run in two directions, and meet in an obtuse angle; and in the middle there is generally seen in this case a straight line running the whole length of the column, and small parcels of clay insinuating themselves into this crack, represent in it the figure of an ear of grass so naturally, as to have deceived many into a belief that there was really an ear of grass there. The other orders consisting only of single genera, the structure of each is explained under the generical name.

SELENITES, in chemistry, called also *gypsum spatosum*, a species of gypsum or plaster of Paris. See GYPSUM.

SELENOGRAPHY, a branch of cosmography, which describes the moon and all the parts and appearances thereof, as geography does those of the earth. See MOON.

SELEUCIA, (anc. geog.), surnamed *Babylonia*, because situated on its confines, at the confluence of the Euphrates and Tigris. Ptolemy places it in Mesopotamia. It is called also *Seleucia ad Tigrim*, (Polybius, Strabo, Isidorus, Characenus); washed on the south by the Euphrates, on the east by the Tigris (Theophylactus); generally agreed to have been built or enlarged by Seleucus Nicanor, master of the east after Alexander; by means of which Babylon came to be deserted.

It is said to have been originally called *Coche*, (Ammian, Eutropius); though others, as Arrian, distinguish it, as a village, from *Seleucia*: and, according to Zosimus, the ancient name of Seleucia was *Zochasia*. Now called *Bagdad*. E. Long. 44. 21. N. Lat. 33. 10. There were many other cities of the same name, all built by Seleucus Nicanor.

SELEUCIDÆ, in chronology. Era of the Seleucidæ, or the Syro-Macedonian era, is a computation of time, commencing from the establishment of the Seleucidæ, a race of Greek kings, who reigned as successors of Alexander the Great in Syria, as the Ptolemies did in Egypt. This era we find expressed in the books of the Maccabees, and on a great number of Greek medals struck by the cities of Syria, &c. The Rabbins call it the *era of contracts*, and the Arabs *therik dilkarnain*, that is, the "era of the two horns." According to the best accounts, the first year of this era falls in the year 311 B. C. being 12 years after Alexander's death.

SELEUCUS (Nicanor), one of the chief generals under Alexander the Great, and, after his death, founder of the race of princes called *Seleucidæ*. He is equally celebrated as a renowned warrior, and as the father of his people; yet his virtues could not protect him from the fatal ambition of Ceraunus, one of his courtiers, by whom he was assassinated 280 B. C.

SELF-HEAL, the PRUNELLA VULGARIS of Linnæus. The stem is erect, and about eight or ten inches high. The leaves grow on footstalks, are ovato-oblong, slightly indented, and somewhat hairy. The bracteæ are heart-shaped, opposite, and fringed. The flowers are white or purplish, grow on dense spikes, and are terminal. This plant is perennial, grows wild in meadows and pasture grounds, and flowers in June and July.

This herb is recommended as a mild restringent and vulnerary in spittings of blood, and other hemorrhagies and fluxes; and in gargarisms against aphthæ and inflammations of the fauces. Its virtues do not appear to be very great; to the taste it discovers a very slight austerity or bitterishness, which is more sensible in the flowery tops than in the leaves, though the latter are generally directed for medicinal use.

Lewis's Materia Medica.

SELF Command, is that steady equanimity which enables a man in every situation to exert his reasoning faculty with coolness, and to do what the present circumstances require. It depends much upon the natural temperament of the body, and much upon the moral cultivation of the mind. He who enjoys good health, and has braced his frame by exercise, has always a greater command of himself than a man of equal mental powers, who has suffered his constitution to become relaxed by indolence; and he who has from his early youth been accustomed to make his passions submit to his reason, must, in any sudden emergency, be more capable of acting properly than he who has tamely yielded to his passion. Hence it is that recluse and literary men, when forced into the bustle of public life, are incapable of acting where promptness is requisite; and that men who have once or twice yielded to a sense of impending danger seldom acquire afterwards that command of themselves which may be necessary to extricate them from subsequent dangers. In one of the earliest battles fought by the late king of Prussia, the sovereign was among the first men who quitted the field: had he behaved in the same manner a second and a third time, he would never have become that hero whose actions astonished Europe. A celebrated engineer among ourselves, who was well known to the writer of this short article, had little science, and was a stranger to the principles of his own art; but being possessed of a firm and vigorous frame, and having been accustomed to struggle with dangers and difficulties, he had such a constant command of himself, as enabled him to employ with great coolness every necessary resource in the day of battle.

But it is not only in battle, and in the face of immediate danger, that self-command is necessary to enable a man to act with propriety. There is no situation in life where difficulties, greater or less, are not to be encountered; and he who would pass through life with comfort to himself, and with utility to the public, must endeavour to keep his passions in constant subjection to his reason. No man can enjoy without inquietude what he cannot lose without pain; and no man who is overwhelmed with despondency under any sudden misfortune can exert the talents necessary to retrieve his circumstances. We ought, therefore, by every means to endeavour to obtain a constant command of ourselves; and nowhere shall we find better lessons for this purpose than in ancient Lacedemon. There certain occupations were appointed for each sex, for every hour, and for every season of life. In a life always active, the passions have no opportunity to deceive, seduce, or corrupt; and the nervous system acquires a firmness which makes it a fit instrument to a vigorous mind.

SELF-Defence implies not only the preservation of one's life, but also the protection of his property, because without property life cannot be preserved in a civilized nation. The extent of property essential to life is indeed small, and this consideration may enable us to decide a question which some moralists have made intricate. By what means, it has been asked, may a man protect his property? May he kill the person who attacks it, if he cannot otherwise repel the attack?

That a man, in the state of nature, may kill the person who makes an attack on his life, if he cannot otherwise repel the attack, is a truth which has never been controverted; and he may do the same in civil society, if his danger be so imminent that it cannot be exerted by the interposition of the protection provided for individuals by the state. In all possible situations, except the three following, whatever is absolutely necessary to the preservation of life may be lawfully performed, for the law of self-preservation is the first and most sacred of those laws which are impressed upon every mind by the Author of nature.

The three excepted situations are those of a soldier in the day of battle, of a criminal about to suffer by the laws of his country, and of a man called upon to renounce his religion. The soldier hazards his life in the most honourable of all causes, and cannot betray his trust, or play the coward, without incurring a high degree of moral turpitude. He knows that the very profession in which he is engaged necessarily subjects him to danger; and he voluntarily incurred that danger for the good of his country, which, with great propriety, annexes to his profession peculiar privileges and much glory. The criminal under sentence of death cannot, without adding to his guilt, resist the execution of that sentence;

fentence; for the power of inflicting punifhment is effential to fociety, and fociety is the ordinance of God, (fee SOCIETY). The man who is called upon to renounce his religion ought to fubmit to the crueleft death rather than comply with that requeft, fince religion is his only fecurity for future and permanent happinefs. But in every other fituation, that which is abfolutely neceffary to the prefervation of life is undoubtedly lawful. Hence it is, that a perfon finking in water is never thought to be guilty of any crime, though he drag his neighbour after him by his endeavours to fave himfelf; and hence, too, a man in danger of perifhing by fhipwreck may drive another from a plank which cannot carry them both, for fince one of two lives muft be loft, no law, human or divine, calls upon either of them to prefer his neighbour's life to his own.

But though the rights of felf-defence authorize us to repel every attack made upon our life, and in cafes of extremity to fave ourfelves at the expence of the life of our innocent neighbour, it is not fo evident that, rather than give to an unjuft demand a few fhillings or pounds, we may lawfully deprive a fellow creature of life, and the public of a citizen. A few pounds loft may be eafily regained; but life when loft can never be recovered. If thefe pounds, indeed, be the whole of a man's property; if they include his clothes, his food, and the houfe where he thelters his head—there cannot be a doubt but that, rather than part with them, he may lawfully kill the aggreffor, for no man can exift without fhelter, food, and raiment. But it is feldom that an attempt is made, or is indeed practicable, to rob a man at once of all that he poffeffes. The queftion then of any importance is, May a man put a robber to death rather than part with a fmall part of his property? Mr Paley doubts whether he could innocently do fo in a ftate of nature, "becaufe it cannot be contended to be for the augmentation of human happinefs, that one man fhould lofe his life or limb, rather than another a pennyworth of his property." He allows, that in civil fociety the life of the aggreffor may be always taken away by the perfon aggrieved, or meant to be aggrieved, when the crime attempted is fuch as would fubject its perpetrator to death by the laws of his country.

It is not often that we feel ourfelves difpofed to differ in opinion from this moft valuable and intelligent writer; but on the prefent occafion we cannot help thinking that he does not reafon with his ufual precifion. To us he even feems to lofe fight of his own principles. No legiflature can have a right to take away life in civil fociety, but in fuch cafes as individuals have the fame right in a ftate of nature. If therefore a man, in the ftate of nature, have not a right to protect his property by killing the aggreffor, when it cannot be otherwife protected, it appears to us felf-evident that no legiflature can have a right to inflict the punifhment of death upon fuch offences; but if the laws inflicting death upon the crime of robbery be morally evil, it is certain that an individual cannot be innocent when he prevents robbery by the death of the robber, merely becaufe he knows that the laws of his country have decreed that punifhment againft thofe convicted of that crime. But we think that the protection of property by the death of the aggreffor may be completely vindicated upon more general principles. It is neceffary, in every ftate, that property be protected, or mankind could not fubfift; but in a ftate of nature every man muft be the defender of his own property, which in that ftate muft neceffarily be fmall: and if he be not allowed to defend it by every mean in his power, he will not long be able to protect it at all. By giving him fuch liberty, a few individuals may, indeed, occafionally lofe their lives and limbs for the prefervation of a very fmall portion of private property; but we believe that the fum of human happinefs will be more augmented by cutting off fuch worthlefs wretches than by expofing property to perpetual depredation; and therefore, if general utility be the criterion of moral good, we muft be of opinion that a man may in every cafe lawfully kill a robber rather than comply with his unjuft demand.

But if a man may without guilt preferve his property by the death of the aggreffor, when it cannot be preferved by any other means, much more may a woman have recourfe to the laft extremity to protect her chaftity from forcible violation. This, indeed, is admitted by Mr Paley himfelf, and will be controverted by no man who reflects on the importance of the female character, and the probable confequences of the fmalleft deviation from the eftablifhed laws of female honour. See SEDUCTION.

SELF-Knowledge, the knowledge of one's own character, abilities, opinions, virtues, and vices. This has always been confidered as a difficult though important acquifition. It is difficult, becaufe it is difagreeable to inveftigate our errors, our faults, and vices; becaufe we are apt to be partial to ourfelves, even when we have done wrong; and becaufe time and habitual attention are requifite to enable us to difcover our real character. But thefe difficulties are more than counterbalanced by the advantages of felf-knowledge.

By knowing the extent of our abilities, we fhall never rafhly engage in enterprifes where our ineffectual exertions may be productive of harm: by inveftigating our opinions, we may difcover thofe which have no foundation, and thofe alfo which lead us infenfibly into vice. By examining our virtues and vices, we fhall learn what principles ought to be ftrengthened, and what habits ought to be removed.

Man is a rational and intelligent being, capable of great improvement, and liable to great vices. If he acts without examining his principles, he may be hurried by blind paffion into crimes. If he afpires at noble and valuable acquifitions, he muft act upon a plan, with deliberation and fore-thought; for he is not like a vegetable, which attains perfection by the influence of external caufes: he has powers within himfelf which muft be exerted, and exerted with judgment, in order to attain the perfection of his nature. To enable him to employ thefe powers aright, he muft know, firft, what is his duty; and, fecondly, he muft often review his principles and conduct, that he may difcover whether he is performing his duty, or in what circumftances he has failed. When he finds that he has fallen into error and vice, he will naturally inquire what caufes have produced this effect, that he may avoid the fame for the time to come. This is the method by which every reformation in religion and fcience has been produced, and the method by which the arts have been improved. Before Lord Bacon introduced the new way of philofophizing, he muft firft have confidered wherein true philofophy confifted; fecondly, he muft have inquired

Self.

in what respects the ancient method of philosophizing was false or useless: and after determining these two points, he was qualified to describe the way by which the study of philosophy could be successfully pursued without deviating into hypothesis and error. Luther found out the errors of the church of Rome by comparing their doctrines with the Scriptures. But had this comparison never been made, the Reformation could never have taken place. Without self-knowledge, or without that knowledge of our character which is derived from a comparison of our principles and conduct with a perfect standard of morality, we can never form plans and resolutions, or make any exertion to abandon the vicious habits which we have contracted, and strengthen those virtuous principles in which we are deficient.

As much may be learned from the errors of those who have been in similar situations with ourselves; so many useful cautions may be obtained from our own errors; and he that will remember these, will seldom be twice guilty of the same vice.

It was evidently the intention of Providence that man should be guided chiefly by experience. It is by the observations which we make on what we see passing around us, or from what we suffer in our own person, that we form maxims for the conduct of life. The more minutely therefore we attend to our principles, and the more maxims we form, we shall be the better fitted to attain moral perfection.

With respect to our understanding, to mark the errors which we have fallen into, either by its natural defects or by negligence, is also of great importance; for the greatest genius and most profound scholar are liable to these errors, and often commit them as well as the weak and illiterate. But by observing them, and tracing them to their causes, they at length acquire an habitual accuracy. It is true, that men of feeble minds can never by knowing their own defects exalt themselves to the rank of genius; but such knowledge will enable them to improve their understandings, and so to appreciate their own powers, as seldom to attempt what is beyond their strength. They may thus become useful members of society; and though they will not probably be admired for their abilities, they will yet escape the ridicule which is poured upon vanity.

It is difficult to lay down precise rules for the acquisition of this self-knowledge, because almost every man is blinded by a fallacy peculiar to himself. But when one has got rid of that partiality which arises from self-love, he may easily form a just estimate of his moral improvements, by comparing the general course of his conduct with the standard of his duty; and if he has any doubt of the extent of his intellectual attainments, he will most readily discover the truth by comparing them with the attainments of others who have been most successful in the same pursuits. Should vanity arise in his mind from such a comparison, let him then compare the extent of his knowledge with what is yet to be known, and he will then be in little danger of thinking of himself more highly than he ought to think. See PREJUDICE and *Self-Partiality*.

Self-Love, is that instinctive principle which impels every animal, rational and irrational, to preserve its life and promote its own happiness. It is very generally confounded with selfishness; but we think that the one propensity is distinct from the other. Every man loves himself; but every man is not selfish. The selfish man grasps at all *immediate* advantages, regardless of the consequences which his conduct may have upon his neighbour. Self-love only prompts him who is actuated by it to procure to himself the greatest possible sum of happiness during the whole of his existence. In this pursuit the rational self-lover will often forego a present enjoyment to obtain a greater and more permanent one in reversion; and he will as often submit to a present pain to avoid a greater hereafter. Self-love, as distinguished from selfishness, always comprehends the whole of a man's existence, and in that extended sense of the phrase, we hesitate not to say that every man is a self-lover; for, with eternity in his view, it is surely not possible for the most disinterested of the human race not to prefer himself to all other men, if their future and everlasting interests could come into competition. This indeed they never can do; for though the introduction of evil into the world, and the different ranks which it makes necessary in society, put it in the power of a man to raise himself, in the present state, by the depression of his neighbour, or by the practice of injustice, yet in the pursuit of a prize which is to be gained only by soberness, righteousness, and piety, there can be no rivalship among the different competitors. The success of one is no injury to another; and therefore, in this sense of the phrase, self-love is not only lawful, but absolutely unavoidable. It has been a question in morals, whether it be not likewise the incentive to every action, however virtuous or apparently disinterested?

Those who maintain the affirmative side of this question say, that the prospect of immediate pleasure, or the dread of immediate pain, is the only apparent motive to action in the minds of infants, and indeed of all who look not before them, and infer the future from the past. They own, that when a boy has had some experience, and is capable of making comparisons, he will often decline an immediate enjoyment which he has formerly found productive of future evil more than equivalent to all its good; but in doing so they think, and they think justly, that he is still actuated by the principle of self-love, pursuing the greatest good of which he knows himself to be capable. After experiencing that truth, equity, and benevolence in all his dealings is the readiest, and indeed the only certain, method of securing to himself the kindness and good offices of his fellow-creatures, and much more when he has learned that they will recommend him to the Supreme Being, upon whom depends his existence and all his enjoyments, they admit that he will practice truth, equity, and benevolence; but still, from the same principle, pursuing his own ultimate happiness as the object which he has always in view. The prospect of this great object will make him feel an exquisite pleasure in the performance of the actions which he conceives as necessary to its attainment, till at last, without attending in each instance to their consequences, he will, by the great associating principle which has been explained elsewhere (see METAPHYSICS, Part I. Chap I.) feel a refined enjoyment in the actions themselves, and perform them, as occasions offer, without deliberation or reflection. Such, they think, is the origin of benevolence itself, and indeed of every virtue.

Those who take the other side of the question, can hardly deny that self-love thus modified may prompt to virtuous

virtuous and apparently disinterested conduct; but they think it degrading the dignity of man to suppose him actuated solely by motives which can be traced back to a desire of his own happiness. They observe, that the Author of our nature has not left the preservation of the individual, or the continuance of the species, to the deductions of our reason, computing the sum of happiness which the actions necessary to these ends produce to ourselves: on the contrary, He has taken care of both, by the surer impulse of instinct planted in us for these very purposes. And is it conceivable, say they, that He would leave the care of our fellow-creatures a matter of indifference, till each man should be able to discover or be taught that by loving his neighbour, and doing him all the good in his power, he would be most effectually promoting his own happiness? It is dishonouring virtue, they continue, to make it proceed in any instance from a prospect of happiness, or a dread of misery; and they appeal from theory to fact, as exhibited in the conduct of savage tribes, who deliberate little on the consequences of their actions.

Their antagonists reply, that the conduct of savage tribes is to be considered as that of children in civilized nations, regulated entirely by the examples which they have before them; that their actions cannot be the offspring of innate instincts, otherwise savage virtues would, under similar circumstances, everywhere be the same, which is contrary to fact; that virtue proceeds from an interested motive on either supposition: and that the motive which the instinctive scheme holds up is the most selfish of the two. The other theory supposes, that the governing motive is the hope of *future* happiness and the dread of *future* misery; the instinctive scheme supplies a *present* motive in the self-complacency arising in the heart from a consciousness of right conduct. The former is a rational motive, the latter has nothing more to do with reason than the enjoyment arising from eating and drinking, or from the intercourse between the sexes. But we mean not to pursue the subject farther, as we have said enough on it in the articles Benevolence, Instinct, Passion, and Philanthropy. We shall therefore conclude with observing that there is certainly a virtuous as well as a vicious self-love, and that "true self-love and social are the same."

Self-Murder. See Suicide.

Self-Partiality, is a phrase employed by some philosophers * to express that weakness of human nature through which men overvalue themselves when compared with others. It is distinguished from general partiality, by those who make use of the expression, because it is thought that a man is led to over-rate his own accomplishments, either by a particular instinct, or by a process of intellect different from that by which he over-rates the accomplishments of his friends or children. The former kind of partiality is wholly selfish; the latter partakes much of benevolence.

This distinction may perhaps be deemed plausible by those who consider the human mind as little more than a bundle of instincts; but it must appear perfectly ridiculous to such as resolve the greater part of apparent instincts into early and deep-rooted associations of ideas. If the partialities which most men have to their friends, their families, and themselves, be instinctive, they are certainly instincts of different kinds; but an instinctive partiality is a contradiction in terms. Partiality is founded on a comparison between two or more objects; but genuine instincts form no comparisons. See Instinct. No man can be said to be partial to the late Dr Johnson, merely for thinking highly of his intellectual powers; nor was the doctor partial to himself, though he thought in this respect with the generality of his countrymen; but if, upon a comparison with Milton, he was deemed the greater poet of the two, such a judgement will be allowed to be partial, whether formed by himself or by any of his admirers. We apprehend, however, that the process of its formation was the same in every mind by which it was held.

The origin of self-partiality is not difficult to be found; and our partialities to our friends may be traced to a similar source. By the constitution of our nature we are impelled to shun pain and to pursue pleasure: but remorse, the severest of all pains, is the never-failing consequence of vicious conduct. Remorse arises from the dread of that punishment which we believe will in a future state be inflicted on vice unrepented of in this; and therefore every vicious person endeavours by all possible means to banish that dread from his own mind. One way of effecting this is to compare his own life with the lives of others; for he fancies that if numbers be as wicked as himself, the benevolent Lord of all things will not involve them in one common ruin. Hence, by magnifying to himself the temptations which led him astray, and diminishing the injuries which his conduct has done in the world, and by adopting a course diametrically the reverse, when estimating the morality or immorality of the conduct of his neighbours, he soon comes to believe that he is at least not more wicked than they. Thus is self-partiality formed in the mind, and quickly blinds him who is under its influence so completely, as to hide from him the very faults which he sees and blames in others. Hence the coward thinks himself only cautious, the miser frugal. Partiality is formed in the very same manner to natural or acquired accomplishments, whether mental or corporeal. These always procure respect to him who is possessed of them; and as respect is accompanied with many advantages, every man wishes to obtain it for himself. If he fail in his attempts, he consoles himself with the persuasion that it is at least due to his merits, and that it is only withheld by the envy of the public. He compares the particular branch of science or bodily accomplishment in which he himself most excels, with those which have conferred splendour on his rival; and easily finds that his own excellencies are of the highest order, and entitled to the greatest share of public esteem. Hence the polite scholar despises the mathematician; the reader of Aristotle and Plato all the modern discoveries in physical and moral science; and the mere experimentalist holds in the most sovereign contempt a critical knowledge of the ancient languages. The pupil of the ancients denies the merits of the moderns, whilst the mere modern allows nothing to the ancients; and thus each becomes partial to his own acquisitions, and of course to himself, for having been at the trouble to make them.

Partiality to our friends and families is generated in the very same way. Whenever we acquire such an affection for them as to consider their happiness as adding to our own (see Passion), we magnify their excellencies,

* Lord ...'s ... ling.

cellencies, and diminish their defects, for the same reason, and by the same process, that we magnify and diminish our own. All partialities, however, are prejudices, and prejudices of the worst kind. They ought therefore to be guarded against with the utmost care, by the same means which we have elsewhere recommended (see PREJUDICE and METAPHYSICS, N°98.); and he who is partial to his own virtue or his own knowledge, will do well to compare the former, not with the conduct of his neighbour, but with the express rule of his duty; and to consider the latter as no farther valuable than as it contributes to the sum of human happiness.

SELIM I. emperor of the Turks, was the second son of Bajazet II. He made war upon his father, and though defeated in 1511, he at last dethroned him and took him prisoner, and immediately despatched him by poison, together with his elder brother Achmet, and his younger Korkud, an amiable and enlightened prince. Having established his throne by these crimes, he marched against Campson Gaury sovereign of Egypt, gained a great victory at Aleppo, and slew their general. But though the sultan perished in the battle, the Mamelukes determined to oppose the emperor. Selim entering their country at the head of his army, defeated the Egyptians in two battles, and ordered Toumon Bey, the new elected sultan, who had fallen into his hands, to be hung on a gibbet. He then took Cairo and Alexandria, and in a short time reduced all Egypt to subjection. Thus ended the dominion of the Mameluks in Egypt, which had continued for more than 260 years. He confirmed the ancient privileges of the Venetians in Egypt and Syria, by which they carried on their commerce with India, and formed a league with them to destroy the power of the Portuguese in that country. (See INDIA, N° 37.) Selim had before this gained a great victory over the Persians, and stripped them of Tauris and Keman. He was preparing to attack Christendom when he was seized with an ulcerous sore in the back. Thinking that the air of Adrianople would restore his health, he ordered himself to be conducted thither; but he died at Clari in Thrace on his road to that city, in the year 1520, in the very spot where he had poisoned his father. He reigned 8 years, and lived 54. He was a prince of great courage, sobriety, and liberality: he was fond of history, and wrote some verses. But these good qualities were obscured by the most abominable crimes that ever disgraced human nature: he made his way to the throne by shedding the blood of his father, and secured it by murdering his brothers and eight nephews, and every bashaw who had been faithful to his duty.

SELINUM, in botany: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, *Umbellatæ*. The fruit is oval, oblong, compressed, plane, and striated in the middle: the involucrum is reflexed; the petals cordate and equal. There are seven species, the sylvestre, palustre, custriaeum, carvifolia, chabraci, seguieri, monnieri.

SELKIRK (Alexander), whose adventures gave rise to a well-known historical romance, was born at Largo, in the county of Fife, about the year 1676, and was bred a seaman. He went from England, in 1703, in the capacity of sailing-master of a small vessel called the *Cinque-Ports Galley*, Charles Pickering captain, burthen about 90 tons, with 16 guns and 63 men; and in September the same year sailed from Cork, in company with another ship of 26 guns and 120 men, called the St George, commanded by that famous navigator William Dampier, intending to cruise on the Spaniards in the South sea. On the coast of Brasil, Pickering died, and was succeeded in his command by his lieutenant Thomas Stradling. They proceeded on their voyage round Cape Horn to the island of Juan Fernandes, whence they were driven by the appearance of two French ships of 36 guns each, and left five of Stradling's men there on shore, who were taken off by the French. Hence they sailed to the coast of America, where Dampier and Stradling quarrelled, and separated by agreement, on the 19th of May 1704. In September following, Stradling came again to the island of Juan Fernandes, where Selkirk and his captain had a difference, which, with the circumstance of the ship's being very leaky, and in bad condition, induced him to determine on staying there alone; but when his companions were about to depart, his resolution was shaken, and he desired to be taken on board again. The captain, however, refused to admit him, and he was obliged to remain, having nothing but his clothes, bedding, a gun, and a small quantity of powder and ball; a hatchet, knife, and kettle; his books, and mathematical and nautical instruments. He kept up his spirits tolerably till he saw the vessel put off, when (as he afterwards related) his heart yearned within him, and melted at parting with his comrades and all human society at once.

> " ——Yet believe me, Arcas,
> Such is the rooted love we bear mankind,
> All ruffians as they were, I never heard
> A sound so dismal as their parting oars."
>
> *Thomson's Agamemnon.*

Thus left sole monarch of the island, with plenty of the necessaries of life, he found himself in a situation hardly supportable. He had fish, goat's flesh, turnips and other vegetables; yet he grew dejected, languid, and melancholy, to such a degree as to be scarce able to refrain from doing violence to himself. Eighteen months passed before he could, by reasoning, reading his bible, and study, be thoroughly reconciled to his condition. At length he grew happy, employing himself in decorating his huts, chasing the goats, whom he equalled in speed, and scarcely ever failed of catching. He also tamed young kids, laming them to prevent their becoming wild; and he kept a guard of tame cats about him, to defend him when asleep from the rats, who were very troublesome. When his clothes were worn out, he made others of goats skins, but could not succeed in making shoes, with the use of which, however, habit, in time, enabled him to dispense. His only liquor was water. He computed that he had caught 1000 goats during his abode in the island; of which he had let go 500, after marking them by slitting their ears. Commodore Anson's people, who were there about 30 years after, found the first goat which they shot upon landing was thus marked, and as it appeared to be very old, concluded that it had been under the power of Selkirk. But it appears by Captain Carteret's account of his voyage in the Swallow sloop, that other persons practised this mode of marking, as he found a

gnat

Selkirk. goat with his ears thus slit on the neighbouring island of Massafuero, where Selkirk never was. He made companions of his tame goats and cats, often dancing and singing with them. Though he constantly performed his devotions at stated hours, and read aloud; yet, when he was taken off the island, his language, from disuse of conversation, was become scarcely intelligible. In this solitude he continued four years and four months; during which time only two incidents happened which he thought worth relating, the occurrences of every day being in his circumstances nearly similar. The one was, that, pursuing a goat eagerly, he caught it just on the edge of a precipice, which was covered with bushes, so that he did not perceive it, and he fell over to the bottom, where he lay (according to Captain Rogers's account) 24 hours senseless; but, as he related to Sir R. Steele, he computed, by the alteration of the moon, that he had lain three days. When he came to himself, he found the goat lying under him dead. It was with great difficulty that he could crawl to his habitation, whence he was unable to stir for ten days, and did not recover of his bruises for a long time. The other event was the arrival of a ship, which he at first supposed to be French: and such is the natural love of society in the human mind, that he was eager to abandon his solitary felicity, and surrender himself to them, although enemies; but upon their landing, approaching them, he found them to be Spaniards, of whom he had too great a dread to trust himself in their hands. They were by this time so near that it required all his agility to escape, which he effected by climbing into a thick tree, being shot at several times as he ran off. Fortunately the Spaniards did not discover him, though they stayed some time under the tree where he was hid, and killed some goats just by. In this solitude Selkirk remained until the 2d of February 1709, when he saw two ships come into the bay, and knew them to be English. He immediately lighted a fire as a signal; and on their coming on shore, found they were the Duke Captain Rogers, and the Duchess Captain Courtney, two privateers from Bristol. He gave them the best entertainment he could afford; and, as they had been a long time at sea, without fresh provisions, the goats which he caught were highly acceptable. His habitation consisting of two huts, one to sleep in, the other to dress his food in, was so obscurely situated, and so difficult of access, that only one of the ship's officers would accompany him to it. Dampier, who was pilot on board the Duke, and knew Selkirk very well, told Captain Rogers, that, when on board the Cinque Ports, he was the best seaman on board that vessel; upon which Captain Rogers appointed him master's mate of the Duke. After a fortnight's stay at Juan Fernandes, the ships proceeded on their cruise against the Spaniards; plundered a town on the coast of Peru; took a Manilla ship off California; and returned by way of the East Indies to England, where they arrived the 1st of October 1711; Selkirk having been absent eight years, more than half of which time he had spent alone in the island. The public curiosity being excited respecting him, he was induced to put his papers into the hands of Defoe, to arrange and form them into a regular narrative. These papers must have been drawn up after he left Juan Fernandes, as he had no means of recording his transactions there. Captain Cooke remarks, as an extraordinary circumstance, that he had contrived to keep an account of the days of the week and month: but this might be done, as Defoe makes Robinson Crusoe do, by cutting notches in a post, or many other methods. From this account of Selkirk, Defoe took the idea of writing a more extensive work, the romance of Robinson Crusoe, and very dishonestly defrauded the original proprietor of his share of the profits. Of the time or place or manner of this extraordinary man's death we have received no account; but in 1792 the chest and musket which Selkirk had with him on the island were in the possession of his grand nephew, John Selkirk weaver in Largo, where doubtless they are at present.

Selkirk, Selkirkshire.

Selkirk, the capital of the county of the same name, is a small town pleasantly situated on a rising ground, and enjoys an extensive prospect in all directions, especially up and down the river Etterick. It is remarkable for nothing but those plaintive airs produced in its neighbourhood, the natural simplicity of which are the pride of Scotland and the admiration of strangers. W. Long. 2. 46. N. Lat. 45. 26.

SELKIRKSHIRE, called also the *Sheriffdom of Etterick Forest*, a county of Scotland, extending about 20 miles in length from east to west, and about 12 in breadth from south to north. It borders on the north with part of Tweeddale and Mid-Lothian; on the south and east with Teviotdale; and on the west with Annandale. This county was formerly reserved by the Scottish princes for the pleasure of the chase, and where they had houses for the reception of their train. At that time the face of the country was covered with woods, in which there were great numbers of red and fallow deer, whence it had the name of *Etterick Forest*. The woods, however, are now almost entirely cut down, and the county is chiefly supported by the breed of sheep. They are generally sold into the south, but sometimes into the Highlands, about the month of March, where they are kept during summer; and after being improved by the mountain-grass, are returned into the Lowlands in the beginning of winter.

This county, though not very populous at present, was once the nurse of heroes, who were justly accounted the bulwark of their native soil, being ever ready to brave danger and death in its defence. Of this we have a memorable proof in the pathetic lamentations of their wives and daughters for the disaster of the field of Flowden, "where their brave foresters were a' wede away." The rivers Etterick and Yarrow unite a little above the town of Selkirk, and terminate in the Tweed. For five miles above its junction with the Etterick, the Tweed is still adorned with woods, and leads the pleased imagination to contemplate what this country must have been in former times. The Yarrow, for about five miles above its junction with Etterick, exhibits nature in a bold and striking aspect. Its native woods still remain, through which the stream has cut its turbid course, deeply ingulfed amidst rugged rocks. Here, certainly in a flood, stood the descriptive Thomson when he saw it

Statistical Account of Scotland, Vol. II.

"Boil, and wheel, and foam, and thunder through."

Upon a peninsula, cut out by the surrounding stream, in the middle of this fantastically wild scene of grandeur and beauty, stands the castle of Newark, which has been supposed by many to be the birth-place of Mary Scot the flower of Yarrow; but this we believe to be a mistake.

SELLA turcica, is a deep depression between the clinoid apophyses of the sphenoid bone. See Anatomy, p. 682.

SELTZER water, is a mineral water which springs up at Lower Seltzer, a village in the electorate of Triers, about 10 miles from Frankfort on the Maine. It is a very useful medicinal water. It contains, according to some, a very small portion of calcareous earth, of a native mineral alkali, and an acid; but of these the quantity is too small to attribute any medicinal virtues to; but it contains also near 1-7th of its bulk of fixed air, which is more than is found in any other mineral water, and to this it owes its principal virtues. Others have said that it is of the very same nature with Pyrmont water, and contains a subtile aqueous fluid, a volatile iron, and a predominant alkali, all joined together into one brisk spirituous water. The consequence of these different opinions respecting its constituent parts is, that different methods have been recommended for imitating it.

According to the former analysis, artificial Seltzer, water may be prepared by adding one scruple of magnesia alba, six scruples of fossil alkali, and four scruples of common salt, to each gallon of water, and saturating the water with fixed air or carbonic acid. According to the latter it may be imitated by adding to a quart of the purest and lightest water thirty drops of a strong solution of iron made in spirit of salt, a drachm of oil of tartar per deliquium, and thirty drops of spirit of vitriol, or a little more or less as is found necessary, not to let the alkali of the oil of tartar prevail too strongly, tho' it must prevail a little. If the proportions be carefully observed, and the whole of these ingredients shaken briskly together, the artificial Seltzer or Pyrmont water thus made will strongly resemble the natural, and have the same good effect in medicine.

But as fixed air is the only efficacious medicinal part of the composition of Seltzer water, the best method of imitating it is by impregnating common water with that acid by a process for which we are indebted to Dr Priestley. The first idea of this kind occurred to him in 1767, when, having placed shallow vessels of water within the region of fixed air, on the surface of the fermenting vessels of a brewery, and left them all night in that situation, he found that the water had acquired a very sensible and pleasant impregnation. He proceeded to accelerate the impregnation by pouring the water from one vessel into another, while they were both held within the sphere of the fixed air. The method of effecting this by air dislodged from chalk and other calcareous substances did not occur to him till the year 1772, when he published his directions for this purpose, together with a drawing of the necessary apparatus, which he had before communicated to the Board of Admiralty. That apparatus has now given way to another invented by Dr Nooth, which is made of glass, and stands on a wooden vessel *dd* (fig. 1.) resembling a tea-board: the middle vessel B has a neck which is inserted into the mouth of the vessel A, to which it is ground air-tight. The lower neck of the vessel B has a glass stopper S, composed of two parts, both having holes sufficient to let a good quantity of air pass through them. Between these two parts is left a small space, containing a plano-convex lens, which acts like a valve, in letting the air pass from below upwards, and hindering its return into the vessel A. The upper vessel C terminates below in a tube *r t*, which being crooked, hinders the immediate ascent of the bubbles of fixed air into that vessel, before they reach the surface of the water in the vessel B. The vessel C is also ground air-tight to the upper neck or the middle vessel B, and has a stopper *p* fitted to its upper mouth, which has a hole through its middle. The upper vessel C holds just half as much as the middle one B; and the end *t* of the crooked tube goes no lower than the middle of the vessel B.

Plate CCCCLXIV.

For the use of this apparatus: Fill the middle vessel B with spring or any other wholesome water, and join to it the vessel C. Pour water into the vessel A (by the opening *m*, or otherwise) so as to cover the rising part of its bottom: for this about three-fourths of a pint will be sufficient. Fill an ounce phial with oil of vitriol, and add it to the water, shaking the vessel so as to mix them well together. As heat is generated, it will be best to add the oil by a little at a time, otherwise the vessel may be broken. Put to this, through a wide glass or paper funnel, about an ounce of powdered raw chalk or marble. White marble being first granulated, or pounded like coarse sand, is better for the purpose than pounded chalk, because it is harder; and therefore the action of the diluted acid upon it is slower, and lasts to a considerable time. On this account the supply of fixed air from it is more regular than with the chalk: and besides, when no more air is produced, the water may be decanted from the vessel A, and the white sediment washed off, and the remaining granulated marble may be employed again, by adding to it fresh water and a new quantity of oil of vitriol. The funnel in this process is made use of, in order to prevent the powder from touching the inside of the vessel's mouth; for if that happens, it will stick so strongly to the neck of the vessel B as not to admit of their being separated without breaking. Place immediately the two vessels B and C (fastened to each other) into the mouth of the vessel A, as in the figure, and all the fixed air which is disengaged from the chalk or marble by the oil of vitriol will pass up through the valve in S into the vessel B. When this fixed air comes to the top of the vessel B, it will dislodge from thence as much water as is equal to its bulk; which water will be forced up through the crooked tube into the upper vessel C.

Care must be taken not to shake the vessel A when the powdered chalk is put in; otherwise a great and sudden effervescence will ensue, which will perhaps expel part of the contents. In this case it may be necessary to open a little the stopper *p*, in order to give vent, otherwise the vessel A may burst. It will be proper also to throw away the contents and wash the vessel; for the matter will stick between the necks of the vessels, and cement them together. The operation must then be begun afresh. But if the chalk be put into the vessel loosely wrapt up in paper, this accident will be still better guarded against. When the effervescence goes on well, the vessel C will soon be filled with water, and the vessel B half filled with air; which will easily be known to be the case by the air going up in large bubbles through the crooked tube *r t*.

When this is observed, take off the two vessels B and C together as they are, and shake them so that the water and air within them may be much agitated. A great part

Seltzer. part of the fixed air will be abforbed into the water, as will appear by the end of the crooked tube being confiderably under the furface of the water in the veffel. The fhaking them for two or three minutes will be fufficient for this purpofe. Thefe veffels muft not be fhaken while joined to the under one A, otherwife too great an effervefcence will be occafioned in the latter, together with the ill confequence above mentioned. After the water and air have been fufficiently agitated, loofen the upper veffel C, fo that the remaining water may fall down into B, and the unabforbed air pafs out. Put thefe veffels together, and replace them into the mouth of A, in order that B may be again half filled with fixed air. Shake the veffels B and C, and let out the unabforbed air as before. By repeating the operation three or four times, the water will be fufficiently impregnated.

Whenever the effervefcence nearly ceafes in the veffel A, it may be renewed by giving it a gentle fhake, fo that the powdered chalk or marble at the bottom may be mixed with the oil of vitriol and water above it; for then a greater quantity of fixed air will be difengaged. When the effervefcence can be no longer renewed by fhaking the veffel A, either more chalk muft be put in, or more oil of vitriol; or more water, if neither of thefe produce the defired effect.

Mr Magellan has ftill further improved this contrivance. He has two fets of the veffels B and C. While he is fhaking the air and water contained in one of thefe fets, the other may be receiving fixed air from the veffel A. By this means twice the quantity of water may be impregnated in the fame time. He has a wooden ftand on which to fix the veffels B, C, when taken off from A, which is very convenient. He has a fmall tin trough for meafuring the quantity of chalk or marble requifite for one operation, and a wide glafs funnel for putting it through into the veffel A, to prevent its fticking to the fides, as mentioned before.

He has alfo contrived a ftopper without a hole, to be ufed occafionally inftead of the perforated one *p*. It muft be of a conical figure, and very loofe; but fo exactly and fmoothly ground as to be air-tight merely by its preffure. Its ufe is to comprefs the fixed air on the water, and thereby increafe the impregnation. For by keeping the air on the water in this compreffed ftate, the latter may be made to fparkle like champaign. And if the veffels are ftrong, there will be no danger of their burfting in the operation.

The water thus impregnated may be drawn out at the opening *k*. But if it is not wanted immediately, it will be better to let it remain in the machine, where it has no communication with the external air; otherwife the fixed air flies off by degrees, and the water becomes vapid and flat. But it may be kept a long time in bottles well ftopped, efpecially if they are placed with their mouths downwards.

Dr Withering of Birmingham has lately contrived a new apparatus for impregnating water with fixed air, which, he fays, is preferable to that in common ufe, becaufe it can be made at lefs expence, and is more eafily prepared; becaufe the whole quantity of fixable air produced is converted to ufe, without any wafte of the vitriolic acid; becaufe it impregnates three times the quantity of water at one time more completely and with lefs trouble; and the impregnated water will always retain its virtue, if the joints and cocks of the machine are made perfectly air-tight; for which purpofe they fhould once a-year be fupplied with a fmall quantity of unfalted lard. This apparatus is exhibited by fig. 2. and confifts of a glafs veffel A, about ten inches high in the cylindrical part, and fix inches and a half in diameter; another glafs veffel B, about twelve inches high in the conical part, one inch and a half in the neck, and five inches in diameter at the bottom: a copper pipe C paffing through the ftopper of the veffel B, and tied faft in the flexible tube D, made of ftrong leather, air-tight, and kept hollow by means of a fpiral wire paffing through its whole length; a conical brafs pipe E, with a ftop-cock faftened to the tube D; another conical pipe F, with a ftop-cock G, into which the end of the tube E is accurately ground fo as to be air-tight, and cutting off all communication with the atmofphere when the pipe E is removed; two large hog's bladders H, H, each of which ought to hold two quarts; a ftop-cock I to prevent the water rifing into the bladders when the veffel A is agitated; a bladder K tied to the crooked tube with the ftop-cock L, which occafionally opens or fhuts the communication with the veffel B; a glafs funnel M, accurately fitted with the glafs ftopper N; an aperture O, fitted with a glafs ftopper or filver cock, from which the impregnated water is to be drawn for ufe; and, laftly, the tube P opening into the veffel A. When this apparatus is ufed, let the veffel A be filled with pure water, and any other ingredients that are required, in a proper proportion; into the veffel B put as much marble or whiting, in fmall lumps, as will cover its bottom to the height of about two inches, and pour in water to the height reprefented by the dotted line; let the mouth of the veffel A be well fitted with a cork, and through a hole in the cork pafs the tube P, putting upon the cork melted fealing-wax of the fofteft kind, or modelling-wax, fo as to make the whole air tight. Let the mouth of the veffel B be ftopped with a piece of mahogany, turned into a conical figure in a lathe, and of a fize fomewhat larger than the mouth of the glafs will admit; put this piece of wood into melted bees-wax, and heat the wax till the wood begins to grow black: when cool, turn it again till it fits the mouth of the veffel: the tubes C, L, and M are fitted into holes and bored through the wooden ftopper previous to its being immerfed in the wax; pufh thefe tubes through the holes, and prefs the ftopper into the orifice of the veffel B, and cement the whole with fealing or modelling-wax; fhut the ftop-cocks I and L, having previoufly preffed the air out of the bladder K: open the ftop-cocks G and E; then fqueeze the air out of the bladders H, H, and afterwards prefs the conical pipe E into the pipe F; pour about a large fpoonful of oil of vitriol through the funnel M, and ftop it with its ftopper N. The fixable air let loofe by the effervefcence in the veffel B, rifing through the tube C, paffes into the bladders H, H, and diftends them. In this cafe open the ftop-cock I, and from the aperture O draw out about a quart of water; and the fpace before occupied by the water will be filled with fixable air, which foon begins to be abforbed by the remaining water, and is ftill fupplied from the bladders H, H, and from the effervefcing mixture in the veffel B. When the bladders are confiderably collapfed, more vitriolic acid muft be added through the

 funnel

Seltzer.

funnel M, so that they may be always kept pretty fully distended. When an impregnation is speedily required, turn the stop-cocks at G and E, and open that at L; then separate the pipe E from the tube F, and agitate the vessel A; the fixable air will pass into the bladder K, and may be pressed into the two other bladders, when the parts of the apparatus are united. During the agitation, the stop-cock at I should be closed, and opened only occasionally to supply out of the bladders H, H, the fixable air absorbed by the water. If a strong impregnation be required, this process should be carried on in a room, the heat of which does not exceed forty-eight degrees of Fahrenheit's thermometer. Dr Withering observes, that the impregnated water receives no taste from the bladders; and that if the vessel A with its impregnated water be separated from the vessel B at the conical parting E, F, it may be enclosed in a pyramidal mahogany case, out of the lower part of which the silver cock at O projects; and thus serves for an ornamental as well as luxurious and salubrious addition to the side-board, particularly in the summer and autumnal seasons.

The artificial mineral waters thus made, are more pleasant to the taste than the natural Pyrmont or Seltzer waters; which, besides their fixed air, contain saline particles of a disagreeable taste, which are known to contribute little or nothing to their medicinal virtues, and may, in some cases, be hurtful. They are likewise considerably stronger. According to Sir John Pringle, these waters may be made more nearly to resemble genuine Pyrmont water, by adding to each pint of them from eight to ten drops of *tinctura martis cum spiritu salis*. Or this may be done, by adding to the water in the middle vessel B (fig. 1.), in the proportion of about thirty grains of Epsom salt, ten grains of common salt, a scruple of magnesia alba, and a drachm of iron filings or iron wire, clean and free from rust, to one gallon of spring water, and impregnating the whole with fixed air in the matter already described. Let them remain, till the other ingredients and as much of the iron as is necessary are dissolved; which will be in two or three days: or the magnesia may be omitted, and then the operation will be finished in less than half that time. These waters may be rendered ferruginous or chalybeate very easily, by putting in the middle vessel two or more slender phials, filled with cuttings of fine iron binding wire, or with small iron nails; because the impregnated water will dissolve the iron so fast, as to become well saturated with it in a few hours, according to the experiments of Mr Lane. But the method of rendering these artificial waters chalybeate, used by Dr Hulme, is to add one grain of salt of steel to each pint (sixteen ounces) of water already impregnated with fixed air.

But the ingenious Mr Bewley has invented a still better method of exhibiting fixed air as a medicine. He directs a scruple of alkaline salt to be dissolved in a sufficient quantity (a quarter of a pint, or less) of water, which is to be impregnated with as much fixed air as it can imbibe: this is to be taken at one dose. Mr Bewley directs it to be prepared in larger quantities at a time, and calls it his mephitic julep. If immediately after it a spoonful of lemon juice, mixed with two or three spoonfuls of water, and sweetened with sugar, be drunk, the fixed air will be extricated in the stomach; and thus a much greater quantity of it may be given than the same quantity of water alone can be made to imbibe. Fixed air acts as a corroborant; and therefore may be given with success in weakness of the stomach, and in vomitings arising from that cause. It has also been given with success in the stone and in nephritic complaints. When the lungs are purulent, fixed air mixed with the air drawn into the lungs has repeatedly been found to perform a cure. The bark also may be given with advantage in water impregnated with fixed air, as they both coincide in their effect. Fixed air may be applied by means of a syringe, funnel, or otherwise, to inflamed breasts, putrid ulcers, mortified parts, ulcerated sore throats, and has been found in such and similar cases to have very remarkable efficacy. It may also be given internally at the same time. In putrid dysenteries, and in putrid stools, fixed air may be given by way of clyster. Fermenting cataplasms are of service, chiefly as they supply fixed air to the part. In cases of putridity fixed air has been successfully applied to the surface of the body exposed to streams of it. It is also found an excellent cooling as well as strengthening beverage in hot relaxing weather, and has the advantage of being pleasant to the taste.

SEMECARPUS, in botany; a genus of the trigynia order, belonging to the pentandria class of plants. The corolla is quinquepetalous; the drupa is heart-shaped, cellulous, and monospermous. There is but one species.

SEMEN, Seed. See Botany, Sect. IV. p. 435.

With respect to number, plants are either furnished with one seed, as sea-pink and bistort; two, as woodroof and the umbelliferous plants; three, as spurge; four, as the lip-flowers of Tournefort and rough-leaved plants of Ray; or many, as ranunculus, anemone, and poppy.

The form of the seeds is likewise extremely various, being either large or small, round, oval, heart-shaped, kidney-shaped, angular, prickly, rough, hairy, wrinkled, sleek or shining, black, white, or brown. Most seeds have only one cell or internal cavity; those of lesser burdock, valerian, lamb's lettuce, cornelian cherry, and sebesten, have two.

With respect to substance, seeds are either soft, membranaceous, or of a hard bony substance; as in gromwell, tamarind, and all the nuciferous plants.

In point of magnitude, seeds are either very large, as in the cocoa-nut; or very small, as in campanula, *ammannia*, rampions, and throat-wort.

With respect to situation, they are either dispersed promiscuously through the pulp (*semina nidulantia*), as in water-lily; affixed to a suture or joining of the valves of the seed-vessel, as in the cross-shaped and pea-bloom flowers; or placed upon a *placenta* or receptacle within the seed vessel, as in tobacco and thorn-apple.

Seeds are said to be naked (*semina nuda*) which are not contained in a cover or vessel: such are those of the lip and compound flowers, the umbelliferous and rough-leaved plants; covered seeds (*semina tecta*) are contained

contained in some vessel, whether of the capsule, pod, berry, apple, or cherry kind.

A simple seed is such as bears neither crown, wing, nor downy *pappus*; the varieties in seeds, arising from these circumstances, are particularly enumerated under their respective heads.

In assimilating the animal and vegetable kingdoms, Linnæus denominates seeds the eggs of plants. The fecundity of plants is frequently marvellous; from a single plant or stalk of Indian or Turkey wheat, are produced, in one summer, 2000 seeds; of elecampane, 3000; of sun-flower, 4000; of poppy, 32,000; of a spike of cat's tail, 10,000 and upwards; a single fruit, or seed-vessel, of tobacco, contains 1000 seeds; that of white poppy, 8000. Mr Ray relates, from experiments made by himself, that 1012 tobacco seeds are equal in weight to one grain; and that the weight of the whole quantum of seeds in a single tobacco plant, is such as must, according to the above proportion, determine their number to be 360,000. The same author estimates the annual produce of a single stalk of spleen-wort to be upwards of one million of seeds.

The dissemination of plants respects the different methods or vehicles by which nature has contrived to disperse their seeds for the purpose of increase. These by naturalists are generally reckoned four:—

1. Rivers and running waters. 2. The wind. 3. Animals. 4. An elastic spring, peculiar to the seeds themselves.

1. The seeds which are carried along by rivers and torrents are frequently conveyed many hundreds of leagues from their native soil, and cast upon a very different climate, to which, however, by degrees they render themselves familiar.

2. Those which are carried by the wind, are either *winged*, as in fir-tree, trumpet-flower, tulip-tree, birch, arbor-vitæ, meadow-rue, and jessamine, and some umbelliferous plants; furnished with a *pappus*, or downy crown, as in valerian, poplar, reed, succulent swallow-wort, cotton-tree, and many of the compound flowers; placed within a winged *calyx* or seed-vessel, as in scabious, sea-pink, dock, dioscorea, ash, maple, and elm-trees, logwood and woad; or, lastly, contained within a swelled *calyx* or seed-vessel, as in winter-cherry, cucubalus, melilot, bladder-nut, fumitory, bladder-sena, heart-seed, and chick-pease.

3. Many birds swallow the seeds of vanelloe, juniper, missletoe, oats, millet, and other grasses, and void them entire. Squirrels, rats, parrots, and other animals, suffer many of the seeds which they devour to escape, and thus in effect disseminate them. Moles, ants, earthworms, and other insects, by ploughing up the earth, admit a free passage to those seeds which have been scattered upon its surface. Again, some seeds attach themselves to animals, by means of hooks, crotchets, or hairs, which are either affixed to the seeds themselves, as in hounds-tongue, mouse-ear, vervain, carrot, bastard parsley, sanicle, water hemp-agrimony, *arctopus* and *verbesina*; to their calyx, as in burdock, agrimony, *rhexia*, small wild bugloss, dock, nettle, pellitory, and lead-wort; or to their fruit or seed-vessel, as in liquorice, enchanter's night-shade, cross-wort, clivers, French honeysuckle, and arrow-headed grass.

4. The seeds which disperse themselves by an elastic force, have that force resident either in their *calyx*, as in oats and the greater number of ferns; in their *pappus*, as in centaurea crupina; or in their *capsule*, as in geraunium, herb-bennet, African spiræa, fraxinella, horse-tail, balsam, Malabar nut, cucumber, elaterium, and male balsam apple.

SEMEN, in the animal œconomy. See PHYSIOLOGY, Sect. xii. and ANATOMY, N° 109.

SEMEN *Sanctum*, or *Santonicum*. See ARTEMISIA.

SEMENDRIAH, a town of Turkey in Europe, in the province of Servia, with a good citadel. It is the capital of a sangiacate, was taken by the Turks in 1690, and is seated on the Danube, in E. Long. 21. 45. N. Lat. 45. 0.

SEMENTINÆ FERIÆ, in antiquity, feasts held annually among the Romans, to obtain of the gods a plentiful harvest. They were celebrated in the temple of Tellus, where solemn sacrifices were offered to Tellus and Ceres. These feasts were held about seed-time, usually in the month of January; for, as Macrobius observes, they were moveable feasts.

SEMI, a word borrowed from the Latin, signifying *half*; but only used in composition with other words, as in the following articles:—

SEMI-*Arians*, in ecclesiastical history, a branch of the ancient Arians, consisting, according to Epiphanios, of such as, in appearance, condemned the errors of that heresiarch, but yet acquiesced in some of the principles thereof, only palliating and hiding them under softer and more moderate terms. Though they separated from the Arian faction (see ARIANS), they could never be brought to acknowledge that the Sun was homuousios, that is, consubstantial, or of the same substance with the Father; they would only allow him to be homoiousios, that is, of a like substance with the Father, or similar to the Father in his essence, not by nature, but by a peculiar privilege.

The semi-arianism of the moderns consists in their maintaining that the Son was from all eternity begotten by the *will* of the Father, contrary to the doctrine of the orthodox, who seem to teach that the eternal generation is *necessary*. Such at least are the respective opinions of Dr Clarke and Bishop Bull. See THEOLOGY.

SEMICIRCLE, in geometry, half a circle, or that figure comprehended between the diameter of the circle and half its circumference.

SEMICOLON, in grammar, one of the points or stops used to distinguish the several members of a sentence from each other.

The mark or character of the semicolon is (;), and has its name as being of somewhat less effect than a colon: or as demanding a shorter pause.

The proper use of the semicolon is to distinguish the conjunct members of a sentence. Now, by a conjunct member of a sentence is meant such a one as contains at least two simple members.—Whenever, then, a sentence can be divided into several members of the same degree, which are again divisible into other simple members, the former are to be separated by a semicolon. For instance: "If fortune bear a great sway over him, who has nicely stated and concerted every circumstance of an affair; we must not commit every thing, without reserve, to fortune, lest she have too great a hold of us." Again: *Si quantum in agro locisque desertis audacia potest, tantum in foro atque judiciis impudentia valeret; non minus in causa cederet Aulus Cæcinna Sexto Æbutii impudentiæ*,

dentiæ, quam tum in vi facienda, cessit audaciæ. An instance in a more complex sentence we have in Cicero: *Res familiaris primum bene parta sit, nulloque turpi quæstu: tum quam plurimis, modo dignis, se utilem præbeat; deinde augeatur ratione, diligentia, parsimonia; nec libidini potius luxuriæque, quam liberalitate et beneficentiæ pareat.*

But though the proper use of the semicolon be to distinguish conjunct members, it is not necessary that all the members divided hereby be conjunct. For upon dividing a sentence into great and equal parts, if one of them be conjunct, all these other parts of the same degree are to be distinguished by a semicolon.—Sometimes also it happens, that members that are opposite to each other, but relate to the same verb, are separated by a semicolon. Thus Cicero: *Ex hac parte pudor, illinc petulantia; hinc fides, illinc fraudatio; hinc pietas, illinc scelus,* &c. To this likewise may be referred such sentences, where the whole going before, the parts follow: as "The parts of oratory are four; invention, disposition, elocution, and pronunciation."

Semicubium, in medicine, a half-bath, wherein the patient is only placed up to the navel.

Semidiameter, half the diameter, or a right line drawn from the centre of a circle or sphere to its circumference: being the same with what is otherwise called the *radius*.

Semiflosculus, in botany, a term used to express the flowers of the syngenesia class. These semiflosculi are petals, hollow in their lower part, but in their upper flat, and continued in the shape of a tongue.

Semitone, in music. See Interval.

SEMINAL, something belonging to the semen or seed.

SEMINARY, in its primary sense, the ground where any thing is sown, to be afterwards transplanted.

Seminary, in a figurative sense, is frequently applied to places of education, whence scholars are transplanted into life.—In Catholic countries it is particularly used for a kind of college or school, where youth are instructed in the ceremonies, &c. of the sacred ministry. Of these there are great numbers; it being ordained by the council of Trent, that there be a seminary belonging to each cathedral, under the direction of the bishop.

SEMINATION, denotes the manner or act of shedding and dispersing the seed of plants. See Semen.

SEMIPELAGIANS, in ecclesiastical history, a name anciently, and even at this day, given to such as retain some tincture of Pelagianism. See Pelagians.

Cassian, who had been a deacon of Constantinople, and was afterwards a priest at Marseilles, was the chief of these Semipelagians; whose leading principles were, 1. That God did not dispense his grace to one more than another in consequence of predestination, *i. e.* an eternal and absolute decree, but was willing to save all men, if they complied with the terms of his gospel. 2. That Christ died for all men. 3. That the grace purchased by Christ, and necessary to salvation, was offered to all men. 4. That man, before he received grace, was capable of faith and holy desires. 5. That man was born free, and was consequently capable of resisting the influences of grace, or of complying with its suggestion. The Semipelagians were very numerous; and the doctrine of Cassian, though variously explained, was received in the greatest part of the monastic schools in Gaul, from whence it spread itself far and wide thro' the European provinces. As to the Greeks and other eastern Christians, they had embraced the Semipelagian doctrines before Cassian, and still adhere to them. In the 6th century, the controversy between the Semipelagians and the disciples of Augustin prevailed much, and continued to divide the western churches.

SEMIRAMIS (fab. hist.), a celebrated queen of Assyria, daughter of the goddess Derceto, by a young Assyrian. She was exposed in a desert; but her life was preserved by doves for one whole year, till Simmas, one of the shepherds of Ninus, found her and brought her up as his own child. Semiramis, when grown up, married Menones, the governor of Nineveh, and accompanied him to the siege of Bactria; where, by her advice and prudent directions, she hastened the king's operations, and took the city. These eminent services, together with her uncommon beauty, endeared her to Ninus. The monarch asked her of her husband, and offered him his daughter Sosana in her stead; but Menones, who tenderly loved Semiramis, refused; and when Ninus had added threats to entreaties, he hanged himself. No sooner was Menones dead, than Semiramis, who was of an aspiring soul, married Ninus, by whom she had a son called *Ninyas*. Ninus was so fond of Semiramis, that at her request he resigned the crown, and commanded her to be proclaimed queen and sole empress of Assyria. Of this, however, he had cause to repent; Semiramis put him to death, the better to establish herself on the throne; and when she had no enemies to fear at home, she began to repair the capital of her empire, and by her means Babylon became the most superb and magnificent city in the world. She visited every part of her dominions, and left everywhere immortal monuments of her greatness and benevolence. To render the roads passable and communication easy, she hollowed mountains and filled up valleys, and water was conveyed at a great expence by large and convenient aqueducts to barren deserts and unfruitful plains. She was not less distinguished as a warrior: Many of the neighbouring nations were conquered; and when Semiramis was once told as she was dressing her hair, that Babylon had revolted, she left her toilette with precipitation, and though only half dressed, she refused to have the rest of her head adorned before the sedition was quelled and tranquillity re-established. Semiramis has been accused of licentiousness; and some authors have observed that she regularly called the strongest and stoutest men in her army to her arms, and afterwards put them to death, that they might not be living witnesses of her incontinence. Her passion for her son was also unnatural; and it was this criminal propensity which induced Ninyas to destroy his mother with his own hands. Some say that Semiramis was changed into a dove after death, and received immortal honours in Assyria. It is supposed that she lived about 11 centuries before the Christian era, and that she died in the 62d year of her age and the 25th of her reign. Many fabulous reports have been propagated about Semiramis, and some have declared that for some time she disguised herself and passed for her son Ninyas. *Lempriere's Bibliotheca Classica.*

SEMPERVIVUM, house-leek, in botany: A genus of plants belonging to the order of dodecagynia, and to the class of dodecandria; and in the natural method ranking under the 13th order, *Succulentæ*. The calyx is divided into 12 parts; the petals are 12, and the capsules

12, containing many ſeeds. There are 12 ſpecies; the arboreum, canarienſe, glutinoſum, glanduloſum, tectorum, globiferum, villoſum, tortuoſum, arachnoideum, montanum, ſediforme, and menanthes. Linnæus has only eight of theſe. The tectorum alone is a native of Britain. The ſtalk is about a foot high; the radical leaves are thick, oval, pointed, fringed, and ſpreading in a roſe; thoſe on the ſtem are imbricated and membranous: the flowers are pale red and ſeſſile, and grow on curved terminal bunches. It is frequent on the tops of houſes, and flowers in July.

Lewis's Materia Medica.

The following chemical deſcription of this ſpecies is given by Lewis: "The leaves of houſe leek, of no remarkable ſmell, diſcover to the taſte a mild ſubacid auſterity: their expreſſed juice, of a pale yellowiſh hue when filtered, yields on inſpiſſation a deep yellow, tenacious, mucilaginous maſs, conſiderably acidulous and acerb: from whence it may be preſumed, that this herb has ſome claim to the refrigerant and reſtringent virtues that have been aſcribed to it. It is obſervable that the filtered juice, on the addition of an equal quantity of rectified ſpirit of wine, forms a light white coagulum, like cream of fine pomatum, of a weak hot penetrating taſte: this, freed from the fluid part, and expoſed to the air, almoſt totally exhales. From this experiment it is concluded by ſome, that houſe-leek contains a volatile alkaline ſalt: but the juice coagulates in the ſame manner with volatile alkalies themſelves, as alſo with fixed alkalies: Acids produce no coagulation."

SENAAR, or SENNAAR. See SENNAAR.

SENATE, in general, is an aſſembly or council of ſenators; that is, of the principal inhabitants of a ſtate, who have a ſhare in the government.

The ſenate of ancient Rome is of all others the moſt celebrated. It exerciſed no contentious juriſdiction; but appointed judges, either from among the ſenators or knights, to determine proceſſes: it alſo appointed governors of provinces, and diſpoſed of the revenues of the commonwealth, &c. Yet did not the whole ſovereign power reſide in the ſenate, ſince it could not elect magiſtrates, make laws, or decide of war and peace; in all which caſes the ſenate was obliged to conſult the people.

The ſenate, when firſt inſtituted by Romulus, conſiſted of 100 members; to whom he afterwards added the ſame number when the Sabines had migrated to Rome. Tarquin the Elder made the ſenate conſiſt of 300, and this number remained fixed for a long time; but afterwards it fluctuated greatly, and was increaſed firſt to 700, and afterwards to 900 by J. Cæſar, who filled the ſenate with men of every rank and order. Under Auguſtus the ſenators amounted to 1000, but this number was reduced, and fixed to 600. The place of a ſenator was always beſtowed upon merit: the monarchs had the privilege of chooſing the members; and after the expulſion of the Tarquins, it was one of the rights of the conſuls, till the election of the cenſors, who from their office ſeemed moſt capable of making choice of men whoſe character was irreproachable, whoſe morals were pure, and relations honourable. Only particular families were admitted into the ſenate; and when the plebeians were permitted to ſhare the honours of the ſtate, it was then required that they ſhould be born of free citizens. It was alſo required that the candidates ſhould be knights before their admiſſion into the ſenate. They were to be above the age of 25, and to have previouſly paſſed through the inferior offices of quæſtor, tribune of the people, edile, pretor, and conſul.

The ſenate always met of courſe on the 1ſt of January, for the inauguration of the new conſuls; and in all months, univerſally, there were three days, viz. the kalends, nones, and ides, on which it regularly met; but it always met on extraordinary occaſions, when called together by a conſul, tribune, or dictator.

To render their decrees valid and authentic, a certain number of members was requiſite, and ſuch as were abſent without ſome proper cauſe were always fined. In the reign of Auguſtus, 400 ſenators were requiſite to make a ſenate. Nothing was tranſacted before ſunriſe or after ſunſet. In their office the ſenators were the guardians of religion, they diſpoſed of the provinces as they pleaſed, they prorogued the aſſemblies of the people, they appointed thankſgivings, nominated their ambaſſadors, diſtributed the public money, and in ſhort had the management of every thing political or civil in the republic, except the creating of magiſtrates, the enacting of laws, and the declarations of war or peace, which were confined to the aſſemblies of the people.

SENATOR, in general, denotes a member of ſome ſenate.

The dignity of a Roman ſenator could not be ſupported without the poſſeſſion of 80,000 ſeſterces, or about 7000l. Engliſh money; and therefore ſuch as ſquandered away their money, and whoſe fortune was reduced below this ſum, were generally ſtruck out of the liſt of ſenators. This regulation was not made in the firſt ages of the republic, when the Romans boaſted of their poverty. The ſenators were not permitted to be of any trade or profeſſion. They were diſtinguiſhed from the reſt of the people by their dreſs; they wore the laticlave, half-boots of a black colour, with a creſcent or ſilver buckle in the form of a C; but this laſt honour was confined only to the deſcendants of thoſe hundred ſenators who had been elected by Romulus, as the letter C ſeems to imply. See the preceding article.

Among us, ſenator is a member of parliament. In the laws of King Edward the Confeſſor, we are told that the Britons called thoſe *ſenators* whom the Saxons called afterwards *aldermen* and *borough-maſters*; though not for their age, but their wiſdom; for ſome of them were young men, but very well ſkilled in the laws. Kenulph king of the Mercians granted a charter, which ran thus: viz. *Conſilio et conſenſu* epiſcoporum *et* ſenatorum *gentis ſuæ largitus fuit dicto monaſterio*, &c.

In Scotland, the lords of ſeſſion are called *ſenators* of the college of juſtice.

SENATUS AUCTORITAS. See the next article.

SENATUS-Conſultum, which made part of the Roman law. When any public matter was introduced into the ſenate, which was always called *referre ad ſenatum*, any ſenator whoſe opinion was aſked, was permitted to ſpeak upon it as long as he pleaſed, and on that account it was often uſual for the ſenators to protract their ſpeeches till it was too late to determine. When the queſtion was put, they paſſed to the ſide of that ſpeaker whoſe opinion they approved, and a majority of votes was eaſily collected, without the trouble of

Seneca. of counting the numbers. When the majority was known, the matter was determined, and a *ſenatus-conſultum* was immediately written by the clerks of the houſe, at the feet of the chief magiſtrates, and it was ſigned by all the principal members of the houſe. When there was not a ſufficient number of members to make a ſenate, the deciſion was called *ſenatus auctoritas*, but it was of no force if it did not afterwards paſs into a *ſenatus-conſultum*.

The *ſenatus-conſulta* were at firſt left in the cuſtody of the kings, and afterwards of the conſuls, who could ſuppreſs or preſerve them; but about the year of Rome 304, they were always depoſited in the temple of Ceres, and afterwards in the treaſury, by the ediles of the people.

SENECA (Lucius Annæus), a Stoic philoſopher, was born at Corduba in Spain, about the beginning of the Chriſtian era, of an equeſtrian family, which had probably been tranſplanted thither in a colony from Rome. He was the ſecond ſon of Marcus Annæus Seneca, commonly called the *rhetorician*, whoſe remains are printed under the title of *Suaſoriæ et Controverſiæ, cum Declamationum Excerptis*; and his youngeſt brother Annæus Mela (for there were three of them) had the honour of being father to the poet Lucan. He was removed to Rome, together with his father and the reſt of his family, while he was yet in his infancy. There he was educated in the moſt liberal manner, and under the beſt maſters. He learned eloquence from his father; but his genius rather leading him to philoſophy, he put himſelf under the Stoics Attalus, Sotion, and Papirius Fabianus; men famous in their way, and of whom he has made honourable mention in his writings. It is probable, too, that he travelled when he was young, ſince we find him, in ſeveral parts of his works, particularly in his *Quæſtiones Naturales*, making very exact and curious obſervations upon Egypt and the Nile.—But this, though entirely agreeable to his own humour, did not at all correſpond with that ſcheme or plan of life which his father had drawn out for him; who therefore forced him to the bar, and put him upon ſoliciting for public employments; ſo that he afterwards became quæſtor, prætor, and, as Lipſius will have it, even conſul.

In the firſt year of the reign of Claudius, when Julia the daughter of Germanicus was accuſed of adultery by Meſſalina, and baniſhed, Seneca was baniſhed too, being charged as one of the adulterers. Corſica was the ſeat of his exile, where he lived eight years; "happy in the midſt of thoſe things which uſually make other people miſerable; *inter eas res beatus, quæ ſolent miſeros facere*:" and where he wrote his books of conſolation, addreſſed to his mother Helvia, and to his friend Polybius, and perhaps ſome of thoſe tragedies which go under his name; for he ſays, *modo ſe levioribus ſtudiis ibi oblectaſſe*. Agrippina being married to Claudius, upon the death of Meſſalina, ſhe prevailed with the emperor to recal Seneca from baniſhment; and afterwards procured him to be tutor to her ſon Nero, whom ſhe deſigned for the empire. Africanus Burrhus, a prætorian præfect, was joined with him in this important charge: and theſe two preceptors, who were intruſted with equal authority, had each his reſpective department. By the bounty and generoſity of his royal pupil, Seneca acquired that prodigious wealth which rendered him in a manner equal to kings. His houſes and walks were the moſt magnificent in Rome. His villas were innumerable: and he had immenſe ſums of money placed out at intereſt in almoſt every part of the world. The hiſtorian Dio reports him to have had 250,000l. ſterling at intereſt in Britain alone; and reckons his calling it in all at a ſum, as one of the cauſes of a war with that nation.

All this wealth, however, together with the luxury and effeminacy of a court, does not appear to have had any ill effect upon the temper and diſpoſition of Seneca. He continued abſtemious, exact in his manners, and, above all, free from the vices ſo commonly prevalent in ſuch places, flattery and ambition. "I had rather (ſaid he to Nero) offend you by ſpeaking the truth, than pleaſe you by lying and flattery: *maluerim veris offendere, quam placere adulando*." How well he acquitted himſelf in quality of preceptor to his prince, may be known from the five firſt years of Nero's reign, which have always been conſidered as a perfect pattern of good government; and if that emperor had but been as obſervant of his maſter through the whole courſe of it, as he was at the beginning, he would have been the delight, and not, as he afterwards proved, the curſe and deteſtation of mankind. But when Poppæa and Tigellinus had got the command of his humour, and hurried him into the moſt extravagant and abominable vices, he ſoon grew weary of his maſter, whoſe life muſt indeed have been a conſtant rebuke to him. Seneca, perceiving that his favour declined at court, and that he had many accuſers about the prince, who were perpetually whiſpering in his ear the great riches of Seneca, his magnificent houſes and fine gardens, and what a favourite through means of theſe he was grown with the people, made an offer of them all to Nero. Nero refuſed to accept them: which, however, did not hinder Seneca from changing his way of life; for, as Tacitus relates, he "kept no more levees, declined the uſual civilities which had been paid to him, and, under a pretence of indiſpoſition, or ſome engagement or other, avoided as much as poſſible appearing in public."

Nero, in the mean time, who, as it is ſuppoſed, had deſpatched Burrhus by poiſon, could not be eaſy till he had rid himſelf of Seneca alſo: For Burrhus was the manager of his military concerns, and Seneca conducted his civil affairs. Accordingly, he attempted, by means of Cleonicus, a freed man of Seneca, to take him off by poiſon; but this not ſucceeding, he ordered him to be put to death, upon an information that he was privy to Piſo's conſpiracy againſt his perſon. Not that he had any real proof of Seneca's being at all concerned in this plot, but only that he was glad to lay hold of any pretence for deſtroying him.—He left Seneca, however, at liberty to chooſe his manner of dying; who cauſed his veins to be opened immediately. His wife Paulina, who was very young in compariſon of himſelf, had yet the reſolution and affection to bear him company, and thereupon ordered her veins to be opened at the ſame time; but as Nero was not willing to make his cruelty more odious and inſupportable than there ſeemed occaſion for, he gave orders to have her death prevented: upon which her wounds were bound up, and the blood ſtopped, in juſt time enough to ſave her; tho', as Tacitus ſays, ſhe looked ſo miſerably

ably pale and wan all her life after, that it was easy to read the loss of her blood and spirits in her countenance. In the mean time, Seneca, finding his death slow and lingering, desired Statius Annæus his physician to give him a dose of poison, which had been prepared some time before in case it should be wanted; but this not having its usual effect, he was carried to a hot bath, where he was at length stifled with the steams. He died, as Lipsius conjectures, in the 63d or 64th year of his age, and in about the 10th or 11th of Nero's reign. Tacitus, on mentioning his death, observes, that, as he entered the bath, he took of the water, and with it sprinkled some of his nearest domestics, saying, "That he offered those libations to Jupiter the Deliverer." These words are an evident proof that Seneca was not a Christian, as some have imagined him to have been; and that the 13 epistles from Seneca to St Paul, and from St Paul to Seneca, are supposititious pieces. His philosophical works are well known.—They consist of 124 *epistles* and distinct treatises; and, except the books of physical questions, are chiefly of the moral kind, treating of anger, consolation, providence, tranquillity of mind, constancy, clemency, the shortness of life, a happy life, retirement, benefits. He has been justly censured by Quintilian and other critics, as one of the first corrupters of the Roman style; but his works are highly valuable, on account of the vast erudition which they discover, and the beautiful moral sentiments which they contain.

SENECIO, Groundsel, in botany: A genus belonging to the class of syngenesia, and to the order of polygamia superflua; and in the natural classification ranked under the 49th order, *Compositæ*. The receptacle is naked; the pappus simple; the calyx cylindrical and calyculated. The scales are equal and contiguous, so as to seem entire; those at the base are few, and have their apices or points decayed. There are 57 species. Of these, seven are British, the vulgaris, viscosus, sylvaticus, erucifolius, jacobæa, paludosus, and sarscenicus.

1. The *vulgaris*, or common groundsel, has its corollæ naked, its leaves sessile, smooth, and sinuated, their segments short, broad, and minutely serrated; the flowers are yellow, and without radii. This weed grows in cultivated ground everywhere, and flowers in May. Its leaves have been used in medicine externally as a vulnerary and refrigerant, and internally as a mild emetic; but they have little or no efficacy. 2. The *viscosus*, or cotton groundsel, has its corollæ revolute, its leaves pinnatifid, viscid, and downy. The scales of the calyx are lax and hairy, and are of the same length with the perianthium. 3. The *sylvaticus*, or mountain groundsel, has its corollæ revolute, its leaves pinnatifid and dentated, the stem corymbous and erect. It flowers in July, and is frequent in woods and heaths. 4. The *erucifolius*, hoary perennial ragwort; the corollæ are radiant; the leaves are pinnatifid, dentated, and downy beneath; the stem is erect, and two feet high; the flowers are yellow, and grow in clusters. This plant is frequent in woods and hedges. 5. The *jacobea*, common ragwort; the corollæ are radiant; the leaves pinnated and lyre-shaped, and of a dark green colour; the stalk is erect, round, and generally purplish; the flowers grow in clusters on the tops of the stalks. The leaves have a bitterish subacrid taste, and extremely nauseous. Simon Pauli says, that a decoction of them cured many soldiers of an epidemic dysentery. 6. The *paludosus*, marsh ragwort; the corollæ are radiant; the leaves sword-shaped, acutely serrated, and somewhat downy underneath; the stem is erect, branched towards the top, and four or five feet high; the flowers are large and yellow. This plant is frequent in fens and ditches in England. 7. The *saracenicus*, broad-leaved ragwort; the corollæ are radiant; the leaves are lanceolated, serrated, and somewhat smooth; the stem is erect, simple, and four or five feet high; there are several flowers on each footstalk, which are yellow, and grow in clusters on the top. The plant grows in moist pastures in England; and flowers in July or August.

SENEGAL, a part of Negroland in Africa, the boundaries of which are not known. See Guinea.

Isle of Senegal, sometimes called *St Louis*, is a small island in the mouth of the river Senegal, and according to Maskelyne's tables is situated in N. Lat. 15. 53. W. Long. 16. 31. The Dutch were the first Europeans who settled at Senegal; but their colony was expelled by the French in 1687. It was taken by the English in 1692; and retaken by the French the year following. It was a second time taken possession of by the English in 1758; but in 1779 the French recovered it, and it was ceded by the British crown by the treaty of 1783.

The best account of this island which we have seen, is given in the interesting voyage of M. Saugnier to the coast of Africa. This adventurer visited Senegal in June 1785.

"The island (says he), properly speaking, is only a bank of sand in the middle of the river. It is 1000 geometrical paces long, and about 60 in its greatest width; is almost on a level with the river and with the sea, being defended from the latter by Barbary point, which is of greater elevation than the colony. The eastern branch of the river is the more considerable of the two, being about 400 toises across; the western branch is only from 50 to 200 toises wide. The isle consists entirely of burning sands, on the barren surface of which you sometimes meet with scattered flints, thrown out among their ballast by vessels coming from Goree, or with the ruins of buildings formerly erected by Europeans. There is scarcely such a thing as a garden upon the island; European seeds in general not thriving here. It is not surprising that the soil is so unproductive; for the air is strongly impregnated with sea salt, which pervades every thing, and consumes even iron in a very short space of time. The heats are excessive, and rendered still more insupportable by the reflection of the sand; so that from ten in the morning until four in the afternoon it is almost impossible to do any work. During the months of January, February, March, and April, the heats are moderated; but in August and the following months they become so oppressive as even to affect the natives themselves. What effect then must they have upon the Europeans, suddenly transported into this burning climate? The nights are a little less sultry; not always, however, but only when the sea breeze sets in. It is then that the inhabitants of the colony breathe a fresher air, for which they have been longing the whole of the day; but this air in our climate would seem a burning vapour. The nights are nevertheless troublesome, notwithstanding the comforts of the sea

Senegal. sea breeze. The instant the sun is set, we are assailed by an infinity of gnats, which are called *moschettos;* their stings are very painful, and their multitudes incredible. The inhabitants find but a poor defence in their gauze curtains. For my own part, accustomed as I had been to live among the Moors, I was but little annoyed by these insects. Being half a savage, I felt no desire to recommend myself to the favourable regard of the fair sex, and I was therefore under no necessity of taking care of my person. In imitation of my former masters, I smeared myself with butter, and this expedient preserved me at all times from these impertinent stingers, these spiteful enemies to the repose of the human kind.

"If the prospect of Senegal is not agreeable to the eye, much less are its environs, which are covered over only with sand, and overrun with mangles. It may be said, without exaggeration, that there is not a more forlorn situation to be found on the face of the inhabited globe, or a place in which the common necessaries of life are procured with greater difficulties. Water, that indispensable aliment of man, is here not potable. Wells are dug in the sand to the depth of five or six feet, and water is obtained by these means; but whatever pains are taken to freshen it, it ever retains a brackish taste. I have distilled this water myself, and observed that it always had a disagreeable favour, which cannot fail to be hurtful to the health: it is true, that when the river is high, its streams are fresh, but the water is only the more dangerous. It proves the cause of most of those maladies which carry off the Europeans so rapidly, that at the end of every three years the colony has a fresh set of inhabitants. The blacks themselves, although accustomed to the climate, are not in this season free from disease."

The fort of St Louis is a quadrangle, and has two bastions of considerable strength; but the greatest security of the fort is its natural situation. The cannon of the fort are numerous, and the arsenal well supplied with small arms and stores. Besides this fort the French had no other upon the river, except Fort St Joseph, which stands about four leagues below the cataract at Govina, though they had a few factories in different parts.

The principal commodity of this country is that of gum Senegal (see *Gum-Senegal*), which is a valuable branch of commerce, as it is used in many arts and manufactures, particularly by the painters in water colours, the silk weavers, and dyers.

The French import from the river Senegal not only gum-arabic, but elephants teeth, hides, bees wax, gold dust, cotton, ostrich feathers, ambergris, indigo, and civet.

Notwithstanding the barrenness of the spot, Senegal contains more than 6000 negroes, including the captives of the Tapades, or negroes born of the black inhabitants of the country. They are never put up to sale, unless convicted of some crime. Their huts, constructed in the form of bee hives, and supported upon four stakes, surround the habitations of the negro inhabitants. The entire height of those huts may rise to about 12 feet, the width in every direction is commonly from 10 to 12. The beds are composed of hurdles laid upon cross bars, supported by forked stakes at the height of about a foot from the ground. Here the slaves sleep promiscuously, men, women, girls, and boys. A fire is made in the middle of the hut, which is filled with smoke, sufficient to stifle any man but a negro.

The men are tall, and the women are accounted the handsomest negresses of all Africa. The Senegalians may be considered as the most courageous people of that part of the world, without even excepting the Moors. Their courage, however, is more nearly allied to temerity than to bravery. In the course of the voyage to Galam, they meet the greatest dangers with gaiety and song; they dread neither musket nor cannon, and are equally fearless of the cayman or crocodile. Should one of their companions be killed, and devoured by these animals before their face, they are not deterred from plunging into the water, if the working of the ship require it. These excellent qualifications which distinguish them, and on which they value themselves so much, do not, however, preserve them from the common contagion of the country, which inclines them all to rapine. They are emulous to surpass one another in all the arts of overreaching and fraud. The conduct of the Europeans has, no doubt, encouraged these vices as much as the lessons of the marabous, who inculcate the duty of plundering the Christians to the utmost of their power.

The Yolof negroes of Senegal are either Christians or Mahometans, or rather one and the other, or with more truth neither; religion being a matter of indifference to them. Those on the continent are of the same way of thinking, and their religious practices are kept up only for the sake of form. A bar of iron, or a few beads, will make them change their opinion at will. By such means are they acted upon; a sufficient proof of their want of all religious principle. The marabous, or priests, and the men of their law, are no better than the rest. "I have examined the character of several of this order of men (says M. Saugnier), and even among the nation of the Poules, who are considered as great fanatics, I discovered that they were only publicly attached to their opinions. 'This white man (say they) does so; he is better informed than I, and why should not I imitate his example?' This way of reasoning is common to all that tract of country.

The colony of Senegal is surrounded with islands, which, on account of the proximity of the sea, are all more unhealthy than that on which the town is built. They are full of standing pools, that, when dried up by the sun, exhale a putrid vapour that carries mortality with it, and desolates these islands. It is doubtless the same cause that takes off so many of the French at Senegal during the dangerous season of the year. This also may be in part occasioned by the bad quality of the water, which flows from the ponds in the neighbourhood of the colony, and though incorporated with that of the river, comes down little agitated by the current, and is easily distinguished by a vapidness of taste. This particular is, in my opinion, essentially worthy of notice, and if properly attended to by our medical men, might become the means of preserving many lives.

Senegal. *Senegal River*, see Niger. As so little is known respecting this river, which is one of the greatest in Africa, any additional information must be interesting. We shall therefore present our readers with the account contained in the communications presented to the Associa-

tion

Senegal, Seneka.

tion for promoting the discovery of the Interior Parts of Africa, which, as far as we know, is the latest and most authentic.

The river known to Europeans by the name of *Niger* or *Senegal* runs on the south of the kingdom of Cashna, in its course towards Tombuctou; and if the report which Ben Alli heard in that town may be credited it is afterwards lost in the sands on the south of the country of Tombuctou. In the map (A), only the known part of its course is marked by a line; and the supposititious part by dots. It may be proper to observe, that the Africans have two names for this river; that is, *Neel il Abeed*, or river of the Negroes; and *Neel il Kibeer*, or the great river. They also term the Nile (that is the Egyptian river) *Neel Shem*; so that the term *Neel*, from whence our Nile, is nothing more than the appellative of river; like Ganges, or Sinde.

Of this river the rise and termination are unknown, but the course is from east to west. So great is its rapidity, that no vessel can ascend its stream; and such is the want of skill, or such the absence of commercial inducements among the nations who inhabit its borders, that even with the current, neither vessels nor boats are seen to navigate. In one place, indeed, the traveller finds accommodations for the passage of himself and of his goods; but even there, tho' the ferrymen, by the indulgence of the sultan of Cashna, are exempted from all taxes, the boat which conveys the merchandises is nothing more than an ill-constructed raft; for the planks are fastened to the timbers with ropes, and the seams are closed both within and without by a plaster of tough clay, of which a large provision is always carried on the raft, for the purpose of excluding the stream wherever its entrance is observed.

The depth of the river at the place of passage, which is more than a hundred miles to the south of the city of Cashna, the capital of the empire of that name, is estimated at 23 or 24 feet English. Its depth is from 10 to 12 peeks, each of which is 27 inches.

Its width is such, that even at the island of Gongoo, where the ferrymen reside, the sound of the loudest voice from the northern shore is scarcely heard; and at Tombuctou, where the name of *Gnewa*, or black, is given to the stream, the width is described as being about that of the Thames at Westminster. In the rainy season it swells above the banks and not only floods the adjacent lands, but often sweeps before it the cattle and cottages of the short-sighted or too confident inhabitants.

That the people who live in the neighbourhood of the Niger should refuse to profit by its navigation, may justly surprise the traveller; but much greater is his astonishment, when he finds that even the food which the bounty of the stream would give, is uselessly offered to their acceptance; for such is the want of skill, or such the settled dislike of the people to this sort of provision, that the fish with which the river abounds are left in undisturbed possession of its waters.

SENEKA, or SENEGA, *Rattlesnake-root*, *Milk-wort*; a medicinal plant. See POLYGALA.

Seneschal ‖ Sennaar.

SENESCHAL, (*Seneschallus*), derived from the German *sein* "a house or place," and *scale* "an officer," is a steward, and signifies one who has the dispensing of justice in some particular cases: As the high seneschal or steward of England; *seneschal de la hotel de roi*, "steward of the king's household, seneschals or stewards of courts, &c." *Co. Lit.* 61. *Croke's Jurisd.* 102. *Kitch.* 38. See STEWARD.

SENNA, the leaf of the cassia senna of Linnæus. See CASSIA.

Senna appears to have been cultivated in England in the time of Parkinson (1640); and Miller tells us, that by keeping these plants in a hot-bed all the summer, he frequently had them in flower; but adds, it is very rarely that they perfect their seeds in England. There can be little doubt, however, but that some of the British possessions may be found well enough adapted to the growth of this vegetable, and that the patriotic views of the Society for encouraging Arts, &c. which has offered a reward to those who succeed in the attempt, will be ultimately accomplished. Woodville's Medical Botany.

Senna, which is in common use as a purgative, was first known to the Arabian physicians Serapion and Mesue: the first among the Greeks who takes any notice of it is Actuarius, but he only speaks of the fruit, and not of the leaves. To remove the disagreeable taste of this medicine, Dr Cullen recommends coriander seeds; and, for preventing the gripings with which it is sometimes attended, he thinks the warmer aromatics, as cardamoms, or ginger, would be more effectual.

The *Senna Italica*, or blunt-leaved senna, is a variety of the Alexandrian species; which, by its cultivation in the south of France (Provence), has been found to assume this change. It is less purgative than the pointed leaved senna, and is therefore to be given in larger doses. It was employed as a cathartic by Dr Wright at Jamaica, where it grows on the sand-banks near the sea. Lond. Med. Jour. Vol. VIII.

SENNAAR, a country of Africa, bordering upon Abyssinia, with the title of a kingdom; the present government of which was established in the 16th century by a race of negroes named, in their own language, *Shillook*. This country, together with all the northern parts of Africa, had been overrun by the Saracens during the rapid conquests of the caliphs; but instead of erecting any distinct principalities here, as in other parts, they had incorporated themselves with the old inhabitants called *Shepherds*, whom they found at their arrival; had converted them to their religion, and become one people with them. In 1504 the Shillook, a people before unknown, came from the western banks of the river Bahiar el Abiad, which empties itself into the Nile, and conquered the country; allowing the Arabs, however, to retain their possessions on condition of paying them a certain tribute. These founded the city of Sennaar, and have ever since continued to carry on an intercourse with Egypt in the way of merchandise. At the establishment of their monarchy the whole nation were Pagans, but soon after became converts to Mohammedanism, and took the name of *Funge*, an appellation signifying "lords or conquerors," and like-

 wise

(A) The map alluded to is that which accompanies the volume which contains the proceedings of the Association. This work was printed in 1791.

Sennaar. wise free citizens. Mr Bruce, who passed through this country in his return from Abyssinia, gives a list of 20 kings who have reigned in it since the conquest of the Shilluck.

This country is inhabited by a people so barbarous and brutish, that no history of them can be expected. One of the most remarkable of their customs is, that the king ascends the throne with the expectation of being murdered whenever the general council of the nation thinks proper. The dreadful office of executioner belongs to one single officer, styled, in the language of the country, *Sid el Coom*; and who is always a relation of the monarch himself. It was from his registers that Mr Bruce took the list of the kings already mentioned, with the number of years they reigned, and which may therefore be received as authentic. The Sid el Coum in office at the time that Mr Bruce visited this country was named Achmet, and was one of his best friends. He had murdered the late king, with three of his sons, one of whom was an infant at its mother's breast; he was also in daily expectation of performing the same office to the reigning sovereign. He was by no means reserved concerning the nature of his office, but answered freely every question that was put to him. When asked by Mr Bruce why he murdered the king's young son in his father's presence? he answered, that he did it from a principle of duty to the king himself, who had a right to see his son killed in a lawful and regular manner, which was by cutting his throat with a sword, and not in a more painful or ignominious way, which the malice of his enemies might possibly have inflicted.

Bruce's Travels, Vol. IV.

The king, he said, was very little concerned at the sight of his son's death, but he was so very unwilling to die himself, that he often pressed the executioner to let him escape; but finding his entreaties ineffectual, he submitted at last without resistance. On being asked, whether he was not afraid of coming into the presence of the king, considering the office he might possibly have to perform? he replied, that he was not in the least afraid on this account: that it was his duty to be with the king every morning, and very late in the evening; that the king knew he would have no hand in promoting his death; but that, when the matter was absolutely determined, the rest was only an affair of decency; and it would undoubtedly be his own choice, rather to fall by the hand of his own relation in private than by a hired assassin, an Arab, or a Christian slave, in the sight of the populace. Baady the king's father, having the misfortune to be taken prisoner, was sent to Atbara to Welled Hassan the governor of that province to be put to death there. But the king, who was a strong man, and always armed, kept so much upon his guard, that Welled could find no opportunity of killing him but by running him through the back with a lance as he was washing his hands. For this Welled himself was afterwards put to death; not on account of the murder itself, but because, in the first place, he, who was not the proper executioner, had presumed to put the king to death; and, in the next, because he had done it with a lance, whereas the only lawful instrument was a sword.

On the death of any of the sovereigns of this country, his eldest son succeeds to the throne of course; on which as many of his brothers as can be found are apprehended, and put to death by the Sid el Coom in the manner already related. Women are excluded from the sovereignty here as well as in Abyssinia. The princesses of Sennaar, however, are worse off than those of Abyssinia, having no settled income, nor being treated in any degree better than the daughters of private persons. The king is obliged, once in his lifetime, to plough and sow a piece of ground; whence he is named *Baady*, the "countryman or peasant;" a title as common among the monarchs of Sennaar as Cæsar was among the Romans. The royal family were originally negroes; but as the kings frequently marry Arab women, the white colour of the mother is communicated to the child. This, we are told by Mr Bruce, is invariably the case when a negro man of Sennaar marries an Arab woman; and it holds equally good when an Arab man marries a negro woman; and he likewise informs us, that he never saw one black Arab all the time he was at Sennaar.

The soil and climate of this country is extremely unfavourable both to man and beast. The men are strong and remarkable for their size, but short-lived; and there is such a mortality among the children, that were it not for a constant importation of slaves, the metropolis would be depopulated. The shortness of their lives, however, may perhaps be accounted for, from their indulging themselves from their infancy in every kind of excess. No horse, mule, nor ass, will live at Sennaar or for many miles round it. The case is the same with bullocks, sheep, dogs, cats, and poultry; all of them must go to the sands every half-year. It is difficult to account for this mortality; though Mr Bruce assures us it is the case everywhere about the metropolis of this country, where the soil is a fat earth, during the first season of the rains. Two greyhounds which he brought along with him from Atbara, and the mules he brought from Abyssinia, lived only a few weeks after their arrival at Sennaar. Several of the kings of Sennaar have tried to keep lions, but it was always found impossible to preserve them alive after the rains. They will live, however, as well as other quadrupeds, in the sands, at no great distance from the capital. No species of tree except the lemon flowers near the city; the cultivation of the rose has often been attempted, but always without success. In other respects, however, the soil of Sennaar is exceedingly fertile, being said to yield 300 fold; but this is thought by Mr Bruce to be a great exaggeration. It is all sown with dora or millet, which is the principal food of the people; wheat and rice are also produced here, which are sold by the pound, even in years of plenty. The soil all round is strongly impregnated with salt, so that a sufficient quantity to serve the inhabitants is extracted from it.

Sennaar. Sennaar, a city of Africa, the capital of the kingdom of that name. It stands, according to Mr Bruce's observations, in N. Lat. 13° 34′ 36″ E. Long. 33° 30′ 30″, on the western side of the Nile, and close upon the banks of it; the ground on which it stands being just high enough to prevent the inundation. The town is very populous, and contains a great many houses. In Poncet's time they were all of one story; but now most of the officers have houses of two stories high. They are built of clay mixed with a very little straw, and have all flat roofs; which shows that the rains here

Sennaar.

must be much less in quantity than to the southward. During the time of Mr Bruce's residence here, however, there was one week of continual rain, and the Nile, after loud thunder and great darkness to the south, increased violently; the whole stream being covered with the wrecks of houses and their furniture; so that he supposed it had destroyed many villages to the southward. About 12 miles to the north-west of Sennaar is a collection of villages named *Shaddly*, from a great saint of that name, who constructed several granaries here. These are no other than large pits dug in the ground, and well plastered in the inside with clay, then filled with grain when it is at its lowest price, and afterwards covered up and plastered again at top: these pits they call *matamores*. On any prospect of dearth they are opened, and the corn sold to the people. About 24 miles north of Shaddly there is another set of granaries named *Wed-Aboud*, still greater than Shaddly; and upon these two the subsistence of the Arabs principally depends: for as these people are at continual war with each other, and direct their fury rather against the crops than the persons of their enemies, the whole of them would be unavoidably starved, were it not for this extraordinary resource. Small villages of soldiers are scattered up and down this country to guard the grain after it is sown, which is only that species of millet named *Dora*; the soil, it is said, being incapable of producing any other. There are great hollows made in the earth at proper distances throughout the country, which fill with water in the rainy season, and are afterwards of great use to the Arabs as they pass from the cultivated parts to the sands. The fly, which is such a dreadful enemy to the cattle, is never seen to the northward of Shaddly.

To the westward of these granaries the country is quite full of trees as far as the river Abiad, or El-aice. In this extensive plain there arise two ridges of mountains, one called *Jibbel Moira*, or the *Mountain of water*; the other *Jibbel Segud*, or the *Cold Mountain*. Both of them enjoy a fine climate, and serve for a protection to the farms about Shaddly and Aboud already mentioned. Here also are fortresses placed in the way of the Arabs, which serve to oblige them to pay tribute in their flight from the cultivated country, during the rains, to the dry lands of Atbara. Each of these districts is governed by the descendant of their ancient and native princes, who long resisted all the power of the Arabs. Sacrifices of a horrid nature are said to have been offered up on these mountains till about the year 1554, when one of the kings of Sennaar besieged first one and then the other of the princes in their mountains; and having forced them to surrender, he fastened a chain of gold to each of their ears, exposed them in the market place at Sennaar, and sold them for slaves at less than a farthing each. Soon after this they were circumcised, converted to the Mahometan religion, and restored to their kingdoms.

Vol IV. p. 475.

"Nothing (says Mr Bruce) is more pleasant than the country around Sennaar in the end of August and beginning of September. The grain, being now sprung up, makes the whole of this immense plain appear a level green land, interspersed with great lakes of water, and ornamented at certain intervals with groups of villages; the conical tops of the houses presenting at a distance the appearance of small encampments. Through this very extensive plain winds the Nile, a delightful river there, above a mile broad, full to the very brim, but never overflowing. Everywhere on these banks are seen herds of the most beautiful cattle of various kinds. The banks of the Nile about Sennaar resemble the pleasantest part of Holland in the summer season; but soon after, when the rains cease, and the sun exerts its utmost influence, the dora begins to ripen, the leaves to turn yellow and to rot, the lakes to putrefy, smell, become full of vermine, and all its beauty suddenly disappears: bare scorched Nubia returns, and all its terrors of poisonous winds and moving sands, glowing and ventilated with sultry blasts, which are followed by a troop of terrible attendants; epilepsies, apoplexies, violent fevers, obstinate agues, and lingering painful dysenteries, still more obstinate and mortal.

"War and treason seem to be the only employment of this horrid people, whom Heaven has separated by almost impassable deserts from the rest of mankind; confining them to an accursed spot, seemingly to give them an earnest in time of the only other curse which he has reserved to them for an eternal hereafter."

With regard to the climate of the country round Sennaar, Mr Bruce has several very curious observations. The thermometer rises in the shade to 119 degrees; but the degree indicated by this instrument does not at all correspond with the sensations occasioned by it; nor with the colour of the people who live under it. "Nations of blacks (says he) live within latitude 13 and 14 degrees; about 10 degrees south of them, nearly under the line, all the people are white, as we had an opportunity of observing daily in the Galla Sennaar, which is in latitude 13 degrees, and is hotter by the thermometer 50 degrees, when the sun is most distant from it, than Gondar, which is a degree farther south, when the sun is vertical. Cold and hot (says our author) are terms merely relative, not determined by the latitude, but elevation of the place. When, therefore, we say *hot*, some other explanation is necessary concerning the place where we are, in order to give an adequate idea of the sensations of that heat upon the body, and the effects of it upon the lungs. The degree of the thermometer conveys this but very imperfectly; 90 degrees is excessively hot at Loheia in Arabia Felix; and yet the latitude of Loheia is but 15 degrees; whereas 90 degrees at Sennaar is only warm as to sense; though Sennaar, as we have already said, is in latitude 13 degrees.

"At Sennaar, then, I call it *cold*, when one fully clothed and at rest feels himself in want of fire. I call it *cool*, when one fully clothed and at rest feels he could bear more covering all over, or in part, than he has at that time. It call it *temperate*, when a man so clothed, and at rest, feels no such want, and can take moderate exercise, such as walking about a room without sweating. I call it *warm*, when a man, so clothed, does not sweat when at rest; but, upon taking moderate exercise, sweats, and again cools. I call it *hot*, when a man at rest, or with moderate excercise, sweats excessively. I call it *very hot*, when a man with thin, or little clothing, sweats much, though at rest. I call it *excessive hot*, when a man, in his shirt and at rest, sweats excessively, when all motion is painful, and the knees feel feeble, as if after a fever. I call it *extreme hot*, when the strength fails, a disposition to faint comes on, a straitness is found in

Sennaar.

in the temples, as if a small cord was drawn tight about the head, the voice impaired, the skin dry, and the head seems more than ordinarily large and light. This, I apprehend, denotes death at hand; but this is rarely or never effected by the sun alone, without the addition of that poisonous wind which pursued us through Atbara, where it has, no doubt, contributed to the total extinction of every thing that hath the breath of life. A thermometer, graduated upon this scale, would exhibit a figure very different from the common one; for I am convinced by experiment, that a web of the finest muslin, wrapt round the body at Sennaar, will occasion at mid-day a greater sensation of heat in the body, than a rise of 5 degrees in the thermometer of Fahrenheit.

"At Sennaar, from 70 to 78 degrees of Fahrenheit's thermometer is cool; from 79 to 92 temperate; at 92 degrees begins warmth. Although the degree of the thermometer marks a greater heat than is felt by the bodies of us strangers, it seems to me that the sensations of the natives bear still a less proportion to that degree than ours. On the 2d of August, while I was lying perfectly enervated on a carpet in a room deluged with water at 12 o'clock, the thermometer at 116, I saw several black labourers pulling down a house, working with great vigour, without any symptoms of being incommoded."

The dress of the people of Sennaar consists only of a long shirt of blue cloth, which wraps them up from the under part of the neck to the feet. It does not, however, conceal the neck in the men, though it does in the women. The men sometimes have a sash tied about their middle; and both men and women go barefooted in the houses, whatever their rank may be. The floors of their apartments, especially those of the women, are covered with Persian carpets. Both men and women anoint themselves, at least once a-day, with camel's grease mixed with civet, which, they imagine, softens their skins, and preserves them from cutaneous eruptions; of which they are so fearful, that they confine themselves to the house if they observe the smallest pimple on their skins. With the same view of preserving their skins, though they have a clean shirt every day, they sleep with a greased one at night, having no other covering but this. Their bed is a tanned bull's hide, which this constant greasing softens very much; it is also very cool, though it gives a smell to their bodies from which they cannot be freed by any washing.

Our author gives a very curious description of the queens and ladies of the court at Sennaar. He had access to them as a physician, and was permitted to pay his visit alone. He was first shown into a large square apartment, where there were about 50 black women, all quite naked excepting a very narrow piece of cotton rag about their waists. As he was musing whether these were all queens, one of them took him by the hand, and led him into another apartment much better lighted than the former. Here he saw three women sitting upon a bench or sofa covered with blue Surat cloth; they themselves being clothed from the neck to the feet with cotton shirts of the same colour. These were three of the king's wives; his favourite, who was one of the number, appeared to be about six feet high, and so corpulent that our traveller imagined her to be the largest creature he had seen next to the elephant and rhinoceros. Her features perfectly resembled those of a negro: a ring of gold passed through her under lip, and weighed it down, till, like a flap, it covered her chin, leaving her teeth bare, which were small and very fine. The inside of her lip was made black with antimony. Her ears reached down to her shoulders, and had the appearance of wings: there was a gold ring in each of them about five inches in diameter, and somewhat smaller than a man's little finger; the weight of which had drawn down the hole where her ear was pierced so much that three fingers might easily pass above the ring. She had a gold necklace like that called *Esclavage*, of several rows, one below another; to which were hung rows of sequins pierced. She had two manacles of gold upon her ancles larger than those used for chaining felons. Our author could not imagine how it was possible for her to walk with them, till he was informed that they were hollow. The others were dressed much in the same manner; only there was one who had chains coming from her ears to the outside of each nostril, where they were fastened. A ring was also put through the gristle of her nose, and which hung down to the opening of her mouth; having all together something of the appearance of a horse's bridle; and Mr Bruce thinks that she must have breathed with difficulty.

Sennaar.

The poorer sort of the people of Sennaar live upon the flour or bread of millet; the rich make puddings of this, toasting the flour before the fire, and putting milk and butter into it; besides which they use beef partly roasted and partly raw. They have very fine and fat horned cattle, but the meat commonly sold in the market is camel's flesh. The liver and spare rib of this animal are always eaten raw; nor did our author see one instance to the contrary all the time he was in the country. Hog's flesh is not sold in the market; but all the common people of Sennaar eat it openly; those in office, who pretend to be Mahometans, doing the same in secret.

There are no manufactures in this country, and the principal article of trade is blue Surat cloth. In former times, when caravans could pass with safety, Indian goods were brought in quantities from Jidda to Sennaar, and then dispersed over the country of the blacks. The returns were made in gold, a powder called *Tibbar*, civet, rhinoceroses horns, ivory, ostrich feathers, and above all slaves or glass, more of these being exported from Sennaar than from all the east of Africa. This trade, however, as well as that of the gold and ivory, is almost destroyed; though the gold is still reputed to be the best and purest in Africa, and is therefore bought at Mocha to be carried to India, where it all centres at last.

SENNERTUS (Daniel), an eminent physician, was born in 1572 at Breslau; and in 1593 he was sent to Wittemberg, where he made great progress in philosophy and physic. He visited the universities of Leipsic, Jena, Francfort upon the Oder, and Berlin; but soon returned to Wittemberg, where he was promoted to the degree of doctor of physic, and soon after to a professorship in the same faculty. He was the first who introduced the study of chemistry into that university; he gained a great reputation by his works and practice, and was very generous to the poor. He died [illegible] the plague at Wittemberg, in 1637. He [illegible]

enemies by contradicting the ancients. He thought the feed of all living creatures animated, and that the foul of this feed produces organization. He was accufed of impiety for afferting that the fouls of beafts are not material; for this was affirmed to be the fame thing with afferting that they are immortal; but he rejected this confequence, as he well might do. See METAPHYSICS, Part III. Chap. VI.

SENONES, (anc. geog.), a people of Gallia Celtica, fituated on the Sequana to the fouth of the Parifii, near the confluence of the Jeauna or Yonne with the above-mentioned river. Their moft confiderable exploit was their invafion of Italy, and taking and burning ROME, as related under that article. This was done by a colony of them long before tranfported into Italy, and fettled on the Adriatic. Their capital, Agendicum in Gaul, was in the lower age called *Senones*, now *Sens*. In Italy the Senones extended themfelves as far as the river Aefis; but were afterwards driven beyond the Rubicon, which became the boundary of Gallia Cifalpina, (Polybius, Strabo.)

SENSATION, in philofophy, the perception of external objects by means of the fenfes. See METAPHYSICS, Part I. Chap. I.

SENSE, a faculty of the foul whereby it perceives external objects by means of the impreffions they make on certain organs of the body. See METAPHYSICS, Part I. and ANATOMY, N° 137. &c.

Common SENSE, is a term that has been varioufly ufed both by ancient and modern writers. With fome it has been fynonymous with public fenfe; with others it has denoted prudence; in certain inftances, it has been confounded with fome of the powers of tafte; and, accordingly, thofe who commit egregious blunders with regard to decorum, faying and doing what is offenfive to their company, and inconfiftent with their own character, have been charged with a defect in common fenfe. Some men are diftinguifhed by an uncommon acutenefs in difcovering the characters of others; and this talent has been fometimes called *common fenfe*; fimilar to which is that ufe of the term, which makes it to fignify that experience and knowledge of life which is acquired by living in fociety. To this meaning Quintilian refers, fpeaking of the advantages of a public education: *Senfum ipfum qui communis dicitur, ubi difcet, cum fe à congreffu, qui non hominibus folum, fed mutis quoque animalibus naturalis eft, fegregarit?* Lib. I. cap. 2.

But the term *common fenfe* hath in modern times been ufed to fignify that power of the mind which perceives truth, or commands belief, not by progreffive argumentation, but by an inftantaneous, inftinctive, and irrefiftible impulfe; derived neither from education nor from habit, but from nature; acting independently of our will, whenever its object is prefented, according to an eftablifhed law, and therefore called *fenfe*; and acting in a fimilar manner upon all, or at leaft upon a great majority of mankind, and therefore called *common fenfe*. See METAPHYSICS, N° 127.

Moral SENSE, is a determination of the mind to be pleafed with the contemplation of thofe affections, actions, or characters, of rational agents, which we call *good* or *virtuous*.

This moral fenfe of beauty in actions and affections may appear ftrange at firft view: fome of our moralifts themfelves are offended at it in Lord Shaftefbury, as being accuftomed to deduce every approbation or averfion from rational views of intereft. It is certain that his lordfhip has carried the influence of the moral fenfe very far, and fome of his followers have carried it farther. The advocates for the felfifh fyftem feem to drive their opinions to the oppofite extreme, and we have elfewhere endeavoured to fhow that the truth lies between the contending parties. See MORAL PHILOSOPHY, N° 27—32.

Public SENSE is defined by the noble author of the Characteriftics to be an innate propenfity to be pleafed with the happinefs of others, and to be uneafy at their mifery. It is found, he fays, in a greater or lefs degree in all men, and was fometimes called κοινονοημα, or *fenfus communis*, by ancient writers.

Of the reality of this public fenfe we have great doubts. The conduct of favages, who are more under the influence of original inftinct than civilized men, gives no countenance to it. Their affections feem all to be felfifh, or at leaft to fpring from felf-love varioufly modified. For the happinefs of their wives they have very little regard, confidering them merely as inftruments of their own pleafure, and valuing them for nothing elfe. Hence they make them toil, while they themfelves indulge in liftlefs idlenefs. To their children we believe they exhibit ftrong fymptoms of attachment, as foon as they derive affiftance from them in war, or in the bufinefs of the chafe; but during the helplefs years of infancy, the child is left by the felfifh father wholly to the care and protection of its wretched mother; who, impelled by the *ftorgé* of all females to their young, cherifhes her offspring with great fondnefs.—The favage is, indeed, fufceptible of ftrong attachments, fimilar to that which we call friendfhip; but fuch attachments are no proofs of difinterefted benevolence, or what his lordfhip calls the *public fenfe*. Two barbarous heroes are probably firft linked together by the obfervation of each other's prowefs in war, or their fkill in purfuing their game; for fuch obfervation cannot fail to fhow them that they may be ufeful to one another; and we have elfewhere fhown how real friendfhip may fpring from fentiments originally felfifh. The favage is very much attached to his horde or tribe, and this attachment refembles patriotifm: but patriotifm itfelf is not a fentiment of pure benevolence delighting in the happinefs of others, and grieving at their mifery: for the patriot prefers his own country to all others, and is not very fcrupulous with refpect to the rectitude of the means by which he promotes its intereft, or depreffes its rivals. The favage purfues with relentlefs rigour the enemies of himfelf or of the tribe to which he belongs; fhows no mercy to them when in his power, but puts them to the cruelleft death, and carries their fcalps to the leader of his party. Thefe facts, which cannot be controverted, are perfectly irreconcileable with innate benevolence, or a public fenfe comprehending the whole race of men; and fhow the truth of that theory by which we have in another place endeavoured to account for all the paffions, focial as well as felfifh. See PASSION.

SENSIBLE NOTE, in mufic, is that which conftitutes a third major above the dominant, and a femi-

tone beneath the tonic. *Si*, or B, is the fenfible note in the tone of *ut* or C *fol* ✻; or G fharp, in the tone of *la* or A.

They call it the *fenfible note* on this account, that it caufes to be perceived the tone or natural feries of the key and the tonic itfelf; upon which, after the chord of the dominant, the fenfible note taking the fhorteft road, is under a neceffity of rifing: which has made fome authors treat this fenfible note as a major diffonance, for want of obferving, that diffonance, being a relation, cannot be conftituted unlefs by two notes between which it fubfifts.

It is not meant that the fenfible note is the feventh of the tone, becaufe, in the minor mode, this feventh cannot be a fenfible note but in afcending; for, in defcending, it is at the diftance of a full note from the tonic, and of a third minor from the dominant.

SENSIBILITY, is a nice and delicate perception of pleafure or pain, beauty or deformity. It is very nearly allied to tafte; and, as far as it is natural, feems to depend upon the organization of the nervous fyftem. It is capable, however, of cultivation, and is experienced in a much higher degree in civilized than in favage nations, and among perfons liberally educated than among boors and illiterate mechanics. The man who has cultivated any of the fine arts has a much quicker and more exquifite perception of beauty and deformity in the execution of that art, than another of equal or even greater natural powers, who has but cafually infpected its productions. He who has been long accuftomed to that decorum of manners which characterizes the polite part of the world, perceives almoft inftantaneoufly the fmalleft deviation from it, and feels himfelf almoft as much hurt by behaviour harmlefs in itfelf, as by the groffeft rudenefs; and the man who has long proceeded fteadily in the paths of virtue, and often painted to himfelf the deformity of vice, and the miferies of which it is productive, is more quickly alarmed at any deviation from rectitude, than another who, though his life has been ftained by no crime, has yet thought lefs upon the principles of virtue and confequences of vice.

Every thing which can be called fenfibility, and is not born with man, may be refolved into affociation, and is to be regulated accordingly; for fenfibilities may be acquired which are inimical to happinefs and to the practice of virtue. The man is not to be envied who has fo accuftomed himfelf to the forms of polite addrefs as to be hurt by the unaffected language and manners of the honeft peafant, with whom he may have occafion to tranfact bufinefs; nor is he likely to acquire much ufeful knowledge who has fo fedulouſly ftudied the beauties of compofition as to be unable to read without difguft a book of fcience or of hiftory, of which the ftyle comes not up to his ftandard of perfection. That fenfibility which we either have from nature, or neceffarily acquire, of the miferies of others, is of the greateft ufe when properly regulated, as it powerfully impels us to relieve their diftrefs; but if it by any means become fo exquifite as to make us fhun the fight of mifery, it counteracts the end for which it was implanted in our nature, and only deprives us of happinefs, while it contributes nothing to the good of others. Indeed there is reafon to believe that all fuch extreme fenfibilities are felfifh affectations, employed as apologies for withholding from the miferable that relief which it is in our power to give; for there is not a fact better eftablifhed in the fcience of human nature; than that paffive perceptions grow gradually weaker by repetition, while active habits daily acquire ftrength.

It is of great importance to a literary man to cultivate his tafte, becaufe it is the fource of much elegant and refined pleafure, (fee TASTE); but there is a degree of faftidioufnefs which renders that pleafure impoffible to be obtained, and is the certain indication of expiring letters. It is neceffary to fubmit to the artificial rules of politenefs, for they tend to promote the peace and harmony of fociety, and are fometimes a ufeful fubftitute for moral virtue; but he who with refpect to them has fo much fenfibility as to be difgufted with all whofe manners are not equally polifhed with his own, is a very troublefome member of fociety. It is every man's duty to cultivate his moral fenfibilities, fo as to make them fubfervient to the purpofes for which they were given to him; but if he either feel, or pretend to feel, the miferies of others to fo exquifite a degree as to be unable to afford them the relief which they have a right to expect, his fenfibilities are of no good tendency.

That the man of true fenfibility has more pains and more pleafures than the callous wretch, is univerfally admitted, as well as that his enjoyments and fufferings are more exquifite in their kinds; and as no man lives for himfelf alone, no man will acknowledge his want of fenfibility, or exprefs a wifh that his heart were callous. It is, however, a matter of fome moment to diftinguifh real fenfibilities from ridiculous affectations, thofe which tend to increafe the fum of human happinefs from fuch as have a contrary tendency; and to cultivate them all in fuch a manner as to make them anfwer the ends for which they were implanted in us by the beneficent Author of nature. This can be done only by watching over them as over other affociations, (fee METAPHYSICS, N°98.); for exceffive fenfibility, as it is not the gift of nature, is the bane of human happinefs. "Too much tendernefs (as Rouffeau well obferves) proves the bittereft curfe inftead of the moft fruitful bleffing; vexation and difappointment are its certain confequences. The temperature of the air, the change of the feafons, the brilliancy of the fun, or thicknefs of the fogs, are fo many moving fprings to the unhappy poffeffor, and he becomes the wanton fport of their arbitration."

SENSITIVE PLANT. See MIMOSA, DIONÆA, and HEDYSARUM.

The fenfitive plants are well known to poffefs a kind of motion, by which the leaves and ftalks are contracted and fall down upon being flightly touched, or fhaken with fome degree of violence.

The contraction of the leaves and branches of the fenfitive plant when touched, is a very fingular phenomenon. Different hypothefes have been formed by botanifts in order to explain it; but we are difpofed to believe that thefe have generally been deduced rather from analogical reafoning than from a collection of facts and obfervation. We fhall therefore give an account of all the important facts which we have been able to collect upon this curious fubject; and then draw fuch conclufions as obviously refult from them, without, however attempting to fupport any old, or to eftablifh a new, hypothefis.

1. It is difficult to touch the leaf of a healthy fenfitive plant fo delicately that it will not immediately collapfe

Sensitive. lapse (A), the foliola or little leaves moving at their base till they come into contact, and then applying themselves close together. If the leaf be touched with a little more force, the opposite leaf will exhibit the same appearance. If a little more force be applied, the partial footstalks bend down towards the common footstalk from which they issue, making with it a more acute angle than before. If the touch be more violent still, all the leaves situated on the same side with the one that has been touched will instantly collapse, and the partial footstalk will approach the common footstalk to which it is attached, in the same manner as the partial footstalk of the leaf approaches the stem or branch from which it issues; so that the whole plant, from having its branches extended, will immediately appear like a weeping birch.

2. These motions of the plant are performed by means of three distinct and sensible articulations. The first, that of the foliola or lobes to the partial footstalk; the second, that of the partial footstalk to the common one; the third, that of the common footstalk to the trunk. The primary motion of all which is the closing of the leaf upon the partial footstalk, which is performed in a similar manner, and by a similar articulation. This, however, is much less visible than the others. These motions are wholly independent on one another, as may be proved by experiment. It appears that if the partial footstalks are moved, and collapse toward the petioli, or these toward the trunk, the little leaves, whose motion is usually primary to these, should be affected also; yet experiment proves that it is possible to touch the footstalks in such a manner as to affect them only, and make them apply themselves to the trunk, while the leaves feel nothing of the touch; but this cannot be, unless the footstalks are so disposed as that they can fall to the trunk, without suffering their leaves to touch any part of the plant in their passage, because, if they do, they are immediately affected.

3. Winds and heavy rains make the leaves of the sensitive plant contract and close; but no such effect is produced from slight showers.

4. At night, or when exposed to much cold in the day, the leaves meet and close in the same manner as when touched, folding their upper surfaces together, and in part over each other, like scales or tiles, so as to expose as little as possible of the upper surface to the air. The opposite sides of the leaves (foliola) do not come close together in the night, for when touched they apply themselves closer together. Dr Darwin kept a sensitive plant in a dark place for some hours after daybreak; the leaves and footstalks were collapsed as in its most profound sleep; and, on exposing it to the light, above 20 minutes passed before it was expanded.

5. In the month of August, a sensitive plant was carried in a pot out of its usual place into a dark cave, the motion that it received in the carriage shut up its leaves, and they did not open till 24 hours afterwards; at this time they became moderately open, but were afterwards subject to no changes at night or morning, but remained three days and nights with their leaves in the same moderately open state. At the end of this time they were brought out again into the air, and there recovered their natural periodical motions, shutting every night, and opening every morning, as naturally and as strongly as if the plant had not been in this forced state; and while in the cave, it was observed to be very little less affected with the touch than when abroad in the open air.

6. The great heats of summer, when there is open sunshine at noon, affect the plant in some degree like cold, causing it to shut up its leaves a little, but never in any very great degree. The plant, however, is least of all affected about nine o'clock in the morning, and that is consequently the properest time to make experiments on it. A branch of the sensitive plant cut off, and laid by, retains yet its property of shutting up and opening in the morning for some days; and it holds it longer if kept with one end in water, than if left to dry more suddenly.

7. The leaves only of the sensitive plant shut up in the night, not the branches: and if it be touched at this time, the branches are affected in the same manner as in the day, shutting up, or approaching to the stalk or trunk, in the same manner, and often with more force. It is of no consequence what the substance is with which the plant is touched, it answers alike to all; but there may be observed a little spot, distinguishable by its paler colour in the articulations of its leaves, where the greatest and nicest sensibility is evidently placed.

8. Duhamel having observed, about the 15th of September, in moderate weather, the natural motion of a branch of a sensitive plant, remarked, that at nine in the morning it formed with the stem an angle of 100 degrees; at noon, 112 degrees; at three afternoon, it returned to 100; and after touching the branch, the angle was reduced to 90. Three quarters of an hour after it had mounted to 112; and, at eight at night, it descended again, without being touched, to 90. The day after, in finer weather, the same branch, at eight in the morning, made an angle of 135 degrees with the stem; after being touched, the angle was diminished to 80; an hour after, it rose again to 135; being touched a second time, it descended again to 80; an hour and a half after, it had risen to 145; and upon being touched a third time, descended to 135; and remained in that position till five o'clock in the afternoon, when being touched a fourth time it fell to 110.

9. The parts of the plants which have collapsed afterwards unfold themselves, and return to their former expanded state. The time required for that purpose varies, according to the vigour of the plant, the season of the year, the hour of the day, the state of the atmosphere. Sometimes half an hour is requisite, sometimes only ten minutes. The order in which the parts recover themselves varies in like manner: sometimes it is the common footstalk; sometimes the rib to which the

(A) As the nature of the sensitive plant is curious, we wish to make the description of it intelligible to those who are not acquainted with the technical language of botany. We have therefore used the word *leaf* instead of *foliolum*, or lobe.

Senſitive. the leaves are attached; and ſometimes the leaves themſelves are expanded, before the other parts have made any attempt to be reinſtated in their former poſition.

10. If, without ſhaking the other ſmaller leaves, we cut off the half of a leaf or lobe belonging to the laſt pair at the extremity or ſummit of a wing, the leaf cut, and its antagoniſt, that is to ſay, the firſt pair, begin to approach each other; then the ſecond, and ſo on ſucceſſively, till all the leſſer leaves, or lobes of that wing, have collapſed in like manner. Frequently, after 12 or 15 ſeconds, the lobes of the other wings, which were not immediately affected by the ſtroke, ſhut; whilſt the ſtalk and its wing, beginning at the bottom, and proceeding in order to the top, gradually recover themſelves. If, inſtead of one of the leſſer extreme leaves, we cut off one belonging to the pair that is next the footſtalk its antagoniſt ſhuts, as do the other pairs ſucceſſively, from the bottom to the top. If all the leaves of one ſide of a wing be cut off, the oppoſite leaves are not affected, but remain expanded. With ſome addreſs, it is poſſible even to cut off a branch without hurting the leaves, or making them fall. The common footſtalk of the winged leaves being cut as far as three-fourths of its diameter, all the parts which hang down collapſe, but quickly recover without appearing to have ſuffered any conſiderable violence by the ſhock. An inciſion being made into one of the principal branches to the depth of one-half the diameter, the branches ſituated betwixt the ſection and the root will fall down; thoſe above the inciſion remain as before, and the leſſer leaves continue open; but this direction is ſoon deſtroyed, by cutting off one of the lobes at the extremity, as was obſerved above. Laſtly, A whole wing being cut off with precaution near its inſertion into the common footſtalk, the other wings are not affected by it, and its own lobes do not ſhut. No motion enſues from piercing the branch with a needle or other ſharp inſtrument.

11. If the end of one of the leaves be burned with the flame of a candle, or by a burning glaſs, or by touching it with hot iron, it cloſes up in a moment, and the oppoſite leaf does the ſame, and after that the whole ſeries of leaves on each ſide of the partial or little footſtalk; then the footſtalk itſelf; then the branch or common footſtalk; all do the ſame, if the burning has been in a ſufficient degree. This proves that there is a very nice communication between all the parts of the plant, by means of which the burning, which only is applied to the extremity of one leaf, diffuſes its influence through every part of the ſhrub. If a drop of aquafortis be carefully laid upon a leaf of the ſenſitive plant, ſo as not to ſhake it in the leaſt, the leaf does not begin to move till the acrid liquor corrodes the ſubſtance of it: but at that time, not only that particular leaf, but all the leaves placed on the ſame footſtalk, cloſe themſelves up. The vapour of burning ſulphur has alſo this effect on many leaves at once, according as they are more or leſs expoſed to it; but a bottle of very acrid and ſulphureous ſpirit of vitriol, placed under the branches unſtopped, produces no ſuch effect. Wetting the leaves with ſpirit of wine has been obſerved alſo to have no effect, nor the rubbing oil of almonds over them; though this laſt application deſtroys many plants.

From the preceding experiments the following concluſions may be fairly drawn: 1. The contraction of Senſitive. the parts of the ſenſitive plant is occaſioned by an external force, and the contraction is in proportion to the force. 2. All bodies which can exert any force affect the ſenſitive plant; ſome by the touch or by agitation, as the wind, rain, &c.; ſome by chemical influence, as heat and cold. 3. Touching or agitating the plant produces a greater effect than an inciſion or cutting off a part, or by applying heat or cold.

Attempts have been made to explain theſe curious phenomena. Dr Darwin, in the notes to his admired poem, entitled, *The Botanic Garden*, lays it down as a principle, that "the ſleep of animals conſiſts in a ſuſpenſion of voluntary motion; and as vegetables are ſubject to ſleep as well as animals, there is reaſon to conclude (ſays he) that the various action of cloſing their petals and foliage may be juſtly aſcribed to a voluntary power; for without the faculty of volition ſleep would not have been neceſſary to them." Whether this definition of ſleep when applied to animals be juſt, we ſhall not inquire; but it is evident the ſuppoſed analogy between the ſleep of animals and the ſleep of plants has led Dr Darwin to admit this aſtoniſhing concluſion, that plants have volition. As volition preſuppoſes a mind or ſoul, it were to be wiſhed that he had given us ſome information concerning the nature of a vegetable ſoul, which can think and will. We ſuſpect, however, that this vegetable ſoul will turn out to be a mere mechanical or chemical one; for it is affected by external forces uniformly in the ſame way, its volition is merely paſſive, and never makes any ſucceſsful reſiſtance againſt thoſe cauſes by which it is influenced. All this is a mere abuſe of words. The ſleep of plants is a metaphorical expreſſion, and has not the leaſt reſemblance to the ſleep of animals. Plants are ſaid to ſleep when the flowers or leaves are contracted and folded together; but we never heard that there is any ſimilar contraction in the body of an animal during ſleep.

The fibres of vegetables have been compared with the muſcles of animals, and the motions of the ſenſitive plant have been ſuppoſed the ſame with muſcular motion. Between the fibres of vegetables and the muſcles of animals, however, there is not the leaſt ſimilarity. If muſcles be cut through, ſo as to be ſeparated from the joints to which they are attached, their powers are completely deſtroyed; but this is not the caſe with vegetable fibres. The following very ingenious experiment which was communicated to us by a reſpectable member of the Univerſity of Edinburgh, is deciſive on this ſubject. He ſelected a growing poppy at that period of its growth, before unfolding, when the head and neck are bent down almoſt double. He cut the ſtalk where it was curved half through on the under ſide, and half through at a ſmall diſtance on the upper ſide, and half through in the middle point between the two ſections, ſo that the ends of the fibres were ſeparated from the ſtalk. Notwithſtanding theſe ſeveral cuttings on the neck, the poppy raiſed its head, and aſſumed a more erect poſition. There is, therefore, a complete diſtinction between muſcular motion and the motions of a plant, for no motion can take place in the limb of an animal when the muſcles of that limb are cut.

In fine, we look upon all attempts to explain the motions of plants as abſurd, and all reaſoning from ſuppoſed analogy between animals and vegetables as the ſource

source of wild conjecture, and not of sound philosophy. We view the contraction and expansion of the sensitive plant in the same light as we do gravitation, chemical attraction, electricity, and magnetism, as a singular fact, the circumstances of which we may be fully acquainted with, but must despair of understanding its cause.

What has been said under this article chiefly refers to the *mimosa sensitiva* and *pudica*. For a full account of the motions of vegetables in general, see *Vegetable Motion*, under the article MOTION.

SENTENCE, in law, a judgment passed in court by the judge in some process, either civil or criminal. See JUDGMENT.

SENTENCE, in grammar, denotes a period; or a set of words comprehending some perfect sense or sentiment of the mind. The business of pointing is to distinguish the several parts and members of sentences, so as to render the sense thereof as clear, distinct, and full as possible. See PUNCTUATION.

In every sentence there are two parts necessarily required; a noun for the subject, and a definitive verb: whatever is found more than these two, affects one of them, either immediately, or by the intervention of some other, whereby the first is affected.

Again, Every sentence is either simple or compound: a simple sentence is that consisting of one single subject, and one finite verb.—A compound sentence contains several subjects and finite verbs, either expressly or implicitly.

A simple sentence needs no point or distinction; only a period to close it: as, "A good man loves virtue for itself."—In such a sentence, the several adjuncts affect either the subject or the verb in a different manner. Thus the word *good* expresses the quality of the subject, *virtue* the object of the action, and *for itself* the end thereof.—Now none of these adjuncts can be separated from the rest of the sentence: for if one be, why should not all the rest? and if all be, the sentence will be minced into almost as many parts as there are words.

But if several adjuncts be attributed in the same manner either to the subject or the verb, the sentence becomes compound, and is to be divided into parts.

In every compound sentence, as many subjects, or as many finite verbs as there are, either expressly or implied, so many distinctions may there be. Thus; "My hopes, fears, joys, pains, all centre in you." And thus *Catilina abiit, excessit, evasit, erupit.*——The reason of which pointing is obvious; for as many subjects or finite verbs as there are in a sentence, so many members does it really contain. Whenever, therefore, there occur more nouns than verbs, or contrariwise, they are to be conceived as equal. Since, as every subject requires its verbs, so every verb requires its subject, wherewith it may agree: excepting, perhaps, in some figurative expressions.

SENTICOSÆ (from *sentis*, a "briar or bramble);" the name of the 35th order in Linnæus's fragments of a natural method, consisting of rose, bramble, and other plants, which resemble them in port and external structure. See BOTANY, page 465.

SENTIMENT, according to Lord Kames, is a term appropriated to such thoughts as are prompted by passion. It differs from a perception; for a perception signifies the act by which we become conscious of external objects. It differs from consciousness of an internal action, such as thinking, suspending thought, inclining, resolving, willing, &c. And it differs from the conception of a relation among objects; a conception of that kind being termed *opinion*.

SENTIMENTS, in poetry. To talk in the language of music, each passion hath a certain tone, to which every sentiment proceeding from it ought to be tuned with the greatest accuracy: which is no easy work, especially where such harmony ought to be supported during the course of a long theatrical representation. In order to reach such delicacy of execution, it is necessary that a writer assume the precise character and passion of the personage represented; which requires an uncommon genius. But it is the only difficulty; for the writer, who, annihilating himself, can thus become another person, need be in no pain about the sentiments that belong to the assumed character: these will flow without the least study, or even preconception; and will frequently be as delightfully new to himself as to his reader. But if a lively picture even of a single emotion require an effort of genius, how much greater the effort to compose a passionate dialogue with as many different tones of passion as there are speakers? With what ductility of feeling must that writer be endued, who approaches perfection in such a work; when it is necessary to assume different and even opposite characters and passions in the quickest succession? Yet this work, difficult as it is, yields to that of composing a dialogue in genteel comedy, exhibiting characters without passion. The reason is, that the different tones of character are more delicate, and less in sight, than those of passion; and, accordingly, many writers, who have no genius for drawing characters, make a shift to represent, tolerably well, an ordinary passion in its simple movements. But of all works of this kind, what is truly the most difficult, is a characteristical dialogue upon any philosophical subject; to interweave characters with reasoning, by suiting to the character of each speaker a peculiarity not only of thought but of expression, requires the perfection of genius, taste, and judgment.

How difficult dialogue writing is, will be evident, even without reasoning, from the miserable compositions of that kind found without number in all languages. The art of mimicking any singularity in gesture or in voice, is a rare talent, though directed by sight and hearing, the acutest and most lively of our external senses: how much more rare must that talent be, of imitating characters and internal emotions, tracing all their different tints, and representing them in a lively manner by natural sentiments properly expressed? The truth is, such execution is too delicate for an ordinary genius; and for that reason the bulk of writers, instead of expressing a passion as one does who feels it, content themselves with describing it in the language of a spectator. To awake passion by an internal effort merely, without any external cause, requires great sensibility; and yet that operation is necessary, not less to the writer than to the actor; because none but those who actually feel a passion can represent it to the life. The writer's part is the more complicated: he must add composition to passion: and must, in the quickest succession, adopt every different character. But a very humble flight of imagination may serve to convert a

 writer into a spectator, so as to figure, in some obscure manner, an action as passing in his sight and hearing. In that figured situation, being led naturally to write like a spectator, he entertains his readers with his own reflections, with cool description, and florid declamation; instead of making them eye-witnesses, as it were, to a real event, and to every movement of genuine passion. Thus most of our plays appear to be cast in the same mould; personages without character, the mere outlines of passion, a tiresome monotony, and a pompous declamatory style.

This descriptive manner of representing passion is a very cold entertainment; our sympathy is not raised by description; we must first be lulled into a dream of reality, and every thing must appear as passing in our sight. Unhappy is the player of genius who acts a part in what may be termed a *descriptive tragedy;* after assuming the very passion that is to be represented, how is he cramped in action, when he must utter, not the sentiments of the passion he feels, but a cold description in the language of a bystander? It is that imperfection, undoubtedly, in the bulk of our plays, which confines our stage almost entirely to Shakespeare, notwithstanding his many irregularities. In our late English tragedies, we sometimes find sentiments tolerably well adapted to a plain passion: but we must not in any of them expect a sentiment expressive of character; and, upon that very account, our late performances of the dramatic kind are for the most part intolerably insipid.

But it may be proper to illustrate this subject by examples. The first examples shall be of sentiments that appear the legitimate offspring of passion; to which shall be opposed what are descriptive only, and illegitimate: and in making this comparison, the instances shall be borrowed from Shakespeare and Corneille, who for genius in dramatic composition stand uppermost in the rolls of fame.

I. Shakespeare shall furnish the first example, being of sentiments dictated by a violent and perturbed passion:

Lear. ——————Filial ingratitude!
Is it not as if this mouth should tear this hand
For lifting food to't?—But I'll punish home;
No, I will weep no more.——In such a night,
To shut me out!——Pour on, I will endure.
In such a night as this! O Regan, Gonerill,
Your old kind father, whose frank heart gave all—
O! that way madness lies: let me shun that;
No more of that.——————

Kent. Good, my lord, enter here.

Lear. Prithee, go in thyself, seek thine own ease,
This tempest will not give me leave to ponder
On things would hurt me more:—but I'll go in;
In, boy, go first. You houseless poverty——
Nay, get thee in; I'll pray, and then I'll sleep—
Poor naked wretches, wheresoe'er you are,
That bide the pelting of this pitiless storm!
How shall your houseless heads, and unfed sides,
Your loop'd and window'd raggedness defend you
From seasons such as this!——O I have ta'en
Too little care of this! take physic, Pomp;
Expose thyself to feel what wretches feel,
That thou may'st shake the superflux to them,
And show the heav'ns more just.

King Lear, Act III. sc. 5.

With regard to the French author, truth obliges us to acknowledge, that he describes in the style of a spectator, instead of expressing passion like one who feels it; which naturally betrays him into a tiresome monotony, and a pompous declamatory style. It is scarce necessary to give examples, for he never varies from that tone. We shall, however, take two passages at a venture, in order to be confronted with those transcribed above. In the tragedy of Cinna, after the conspiracy was discovered, Æmilia, having nothing in view but racks and death to herself and her lover, receives a pardon from Augustus, attended with the brightest circumstances of magnanimity and tenderness. This is a lucky situation for representing the passions of surprise and gratitude in their different stages, which seem naturally to be what follow. These passions, raised at once to the utmost pitch, and being at first too big for utterance, must, for some moments, be expressed by violent gestures only: so soon as there is vent for words, the first expressions are broken and interrupted: at last, we ought to expect a tide of intermingled sentiments, occasioned by the fluctuation of the mind between the two passions. Æmilia is made to behave in a very different manner: with extreme coolness she describes her own situation, as if she were merely a spectator; or rather the poet takes the task off her hands:

Et je me rends, Seigneur, à ces hautes bontés:
Je recouvre la vûe auprès de leurs clartés.
Je connois mon forfait qui me sembloit justice:
Et ce que n'avoit pû la terreur du supplice,
Je sens naitre en mon ame un repentir puissant,
Et mon cœur en secret me dit, qu'il y consent.
Le ciel a résolu votre grandeur suprême;
Et pour preuve, Seigneur, je n'en veux que moi-même.
J'ose avec vanité me donner cet éclat,
Puisqu'il change mon cœur, qu'il veut changer l'état.
Ma haine va mourir, que j'ai crue immortelle;
Elle est morte, et ce cœur devient sujet fidele;
Et prenant désormais cette haine en horreur,
L'ardeur de vous servir succede à sa fureur.

Act V. sc. 3.

So much in general upon the genuine sentiments of passion. We proceed to particular observations. And, first, passions seldom continue uniform any considerable time: they generally fluctuate, swelling and subsiding by turns, often in a quick succession; and the sentiments cannot be just unless they correspond to such fluctuation. Accordingly, a climax never shows better than in expressing a swelling passion: the following passages may suffice for an illustration.

Almeria. ————How hast thou charm'd
The wildness of the waves and rocks to this;
That thus relenting they have giv'n thee back
To earth, to light and life, to love and me?

Mourning Bride, Act I. sc. 7.

I would not be the villain that thou think'st
For the whole space that's in the tyrant's grasp,
And the rich earth to boot.

Macbeth, Act IV. sc. 4.

The

The following passage expresses finely the progress of conviction.

Let me not stir, nor breathe, lest I dissolve
That tender, lovely form, of painted air,
So like Almeria. Ha! it sinks, it falls;
I'll catch it e'er it goes, and grasp her shade.
'Tis life! 'tis warm! 'tis she! 'tis she herself!
It is Almeria! 'tis, it is my wife!

Mourning Bride, Act II. sc. 6.

In the progress of thought our resolutions become more vigorous as well as our passions.

If ever I do yield or give consent,
By any action, word, or thought, to wed
Another lord; may then just heav'n show'r down, &c.

Mourning Bride, Act I. sc. 1.

And this leads to a second observation, That the different stages of a passion, and its different directions, from birth to extinction, must be carefully represented in their order; because otherwise the sentiments, by being misplaced, will appear forced and unnatural.—Resentment, for example, when provoked by an atrocious injury, discharges itself first upon the author: sentiments therefore of revenge come always first, and must in some measure be exhausted before the person injured think of grieving for himself. In the Cid of Corneille, Don Diegue having been affronted in a cruel manner, expresses scarce any sentiment of revenge, but is totally occupied in contemplating the low situation to which he is reduced by the affront:

O rage! ô desespoir! ô vieillesse ennemie!
N'ai-je donc tant vecu que pour cette infamie?
Et ne suis-je blanchi dans les travaux guerriers,
Que pour voir en un jour fletrir tant de lauriers?
Mon bras, qu'avec respect tout l'Espagne admire,
Mon bras qui tant de fois a sauvé cet empire,
Tant de fois affermi le trône de son roi,
Trahit donc ma querelle, et ne fait rien pour moi!
O cruel souvenir de ma gloire passé!
Oeuvre de tant de jours en un jour effaceé!
Nouvelle dignité fatale à mon bonheur!
Precipice élevé d'où tombe mon honneur!
Faut-il de votre eclat voir triompher le comte,
Et mourir sans vengeance, ou vivre dans la honte?
Comte, sois de mon prince à present gouverneur,
Ce haut rang n'admet point un homme sans honneur;
Et ton jaloux orgueil par cet affront insigne,
Malgré le choix du roi, m'en a sû rendre indigne.
Et toi, de mes exploits glorieux instrument,
Mais d'un corps tout de glace inutile ornement,
Fer jadis tant à craindre, et qui dans cette offense,
M'as servi de parade, et non pas de defense,
Va, quitte desormais le dernier des humains,
Passe pour me venger en de meilleures mains.

Le Cid, Act I. sc. 7.

These sentiments are certainly not the first that are suggested by the passion of resentment. As the first movements of resentment are always directed to its object, the very same is the case of grief. Yet with relation to the sudden and severe distemper that seized Alexander bathing in the river Cydnus, Quintus Curtius describes the first emotions of the army as directed to themselves, lamenting that they were left without a leader, far from home, and had scarce any hopes of returning in safety: their king's distress, which must naturally have been their first concern, occupies them but in the second place according to that author. In the Aminta of Tasso, Sylvia, upon a report of her lover's death, which she believed certain, instead of bemoaning the loss of her beloved, turns her thoughts upon herself, and wonders her heart does not break:

Ohime, ben son di sasso,
Poi che questa novella no m'uccide. Act IV. sc. 2.

In the tragedy of Jane Shore, Alicia, in the full purpose of destroying her rival, has the following reflection:

Oh Jealousy! thou bane of pleasing friendship,
Thou worst invader of our tender bosoms;
How does thy rancour poison all our softness,
And turn our gentle nature into bitterness!
See where she comes! Once my heart's dearest blessing,
Now my chang'd eyes are blasted with her beauty,
Loathe that known face, and sicken to behold her.

Act III. sc. 1.

These are the reflections of a cool spectator. A passion, while it has the ascendant, and is freely indulged, suggests not to the person who feels it any sentiment to its own prejudice: reflections like the foregoing occur not readily till the passion has spent its vigour.

A person sometimes is agitated at once by different passions; and the mind in that case, vibrating like a pendulum, vents itself in sentiments that partake of the same vibration. This we give as a third observation:

Queen. Would I had never trod this English earth,
Or felt the flatteries that grow upon it!
Ye've angels faces, but heav'n knows your hearts.
What shall become of me now? wretched lady!
I am the most unhappy woman living.
Alas! poor wenches, where are now your fortunes? [*To her women.*
Shipwreck'd upon a kingdom, where no pity,
No friends, no hope, no kindred, weep for me!
Almost no grave allow'd me.

Henry VIII. Act. III. sc. 1.

Othello. Oh devil, devil!
If that the earth could teem with woman's tears,
Each drop she falls would prove a crocodile.
Out of my sight!
Desdemona. I will not stay t'offend you. [*Going.*
Lodovico. Truly, an obedient lady:
I do beseech your lordship, call her back.
Oth. Mistress——
Des. My lord.
Oth. What would you with her, Sir?
Lod. Who, I, my lord?
Oth. Ay; you did wish that I would make her turn.
Sir, she can turn and turn, and yet go on;
And turn again. And she can weep, Sir, weep;
And she's obedient: as you say, obedient:
Very obedient—proceed you in your tears—
Concerning this, Sir,—oh well painted passion!—
I am commanded home—get you away,
I'll send for you anon—Sir, I obey the mandate,
And will return to Venice.——Hence, avaunt!
[*Exit* Desdemona.

Othello, Act IV. sc. 6.

Æmilia.

Sentiments.

Æmilia. Oh! my good lord, I would speak a word with you.

Othello. Yes, 'tis Æmilia—By and by.—She's dead.
'Tis like she comes to speak of Cassio's death;
The noise was high.—Ha! no more moving?
Still as the grave. Shall she come in? wer't good?
I think she stirs again—No—what's the best?
If she come in, she'll, sure, speak to my wife:
My wife! my wife! what wife? I have no wife;
Oh insupportable? oh heavy hour!

Othello, Act V. sc. 2.

A fourth observation is, That nature, which gave us passions, and made them extremely beneficial when moderate, intended undoubtedly that they should be subjected to the government of reason and conscience. It is therefore against the order of nature, that passion in any case should take the lead in contradiction to reason and conscience: such a state of mind is a sort of anarchy which every one is ashamed of and endeavours to hide or dissemble. Even love, however laudable, is attended with a conscious shame when it becomes immoderate: it is covered from the world, and disclosed only to the beloved object:

Et que l'amour souvent de remors combattu
Paroisse une foiblesse, et non une vertu.

Boileau, l'Art Poet. Chant. III. l. 101.

O, they love least that let men know they love.

Two Gentlemen of Verona, Act I. sc. 3.

Hence a capital rule in the representation of immoderate passions, that they ought to be hid or dissembled as much as possible. And this holds in an especial manner with respect to criminal passions: one never counsels the commission of a crime in plain terms; guilt most not appear in its native colours, even in thought; the proposal must be made by hints, and by representing the action in some favourable light. Of the propriety of sentiment upon such an occasion, Shakespeare, in the *Tempest*, has given us a beautiful example, in a speech by the usurping duke of Milan, advising Sebastian to murder his brother the king of Naples:

Antonio. ——————What might,
Worthy Sebastian,—O, what might—no more.
And yet, methinks, I see it in thy face
What thou shouldst be: the occasion speaks thee, and
My strong imagination sees a crown
Dropping upon thy head. Act II. sc. 2.

A picture of this kind, perhaps still finer, is exhibited in King John, where that tyrant solicits (*Act III. sc. 5.*) Hubert to murder the young prince Arthur; but it is too long to be inserted here.

II. As things are best illustrated by their contraries, we proceed to faulty sentiments, disdaining to be indebted for examples to any but the most approved authors. The first class shall consist of sentiments that accord not with the passion; or, in other words, sentiments that the passion does not naturally suggest. In the second class shall be ranged sentiments that may belong to an ordinary passion, but unsuitable to it as tinctured by a singular character. Thoughts that properly are not sentiments, but rather descriptions, make a third. Sentiments that belong to the passion represented, but are faulty as being introduced too early or too late, make a fourth. Vicious sentiments exposed in their native dress, instead of being concealed or disguised, make a fifth. And in the last class shall be collected sentiments suited to no character nor passion, and therefore unnatural.

The *first* class contains faulty sentiments of various kinds, which we shall endeavour to distinguish from each other.

1. Of sentiments that are faulty by being above the tone of the passion, the following may serve as an example:

Othello. ——————O my soul's joy!
If after every tempest come such calms,
May the winds blow till they have waken'd death:
And let the labouring bark climb hills of seas
Olympus high, and duck again as low
As hell's from heaven? *Othello*, Act II. sc. 6.

This sentiment may be suggested by violent and inflamed passion; but it is not suited to the satisfaction, however great, that one feels upon escaping danger.

2. Instance of sentiments below the tone of the passion. Ptolemy, by putting Pompey to death, having incurred the displeasure of Cæsar, was in the utmost dread of being dethroned: in that agitating situation, Corneille makes him utter a speech full of cool reflection, that is in no degree expressive of the passion.

Ah! si je t'avois crû, je n'aurois pas de maitre,
Je serois dana le trône où le ciel m'a fait naître;
Mais c'est une imprudence assez commune aux rois,
D'écouter trop d'avis, et se tromper au choix.
Le Destin les aveugle au bord du précipice,
Ou si quelque lumiere en leur ame se glisse,
Cette fausse clarté dont il les eblouit,
Le plonge dans une gouffre, et puis s'evanouit.

La Mort de Pompé, Act IV. sc. 1.

3. Sentiments that agree not with the tone of the passion; as where a pleasant sentiment is grafted upon a painful passion, or the contrary. In the following instances, the sentiments are too gay for a serious passion:

No happier task these faded eyes pursue;
To read and weep is all they now can do.

Eloisa to Abelard. l. 47.

Again;

Heav'n first taught letters for some wretch's aid,
Some banish'd lover, or some captive maid:
They live, they speak, they breathe what love inspires,
Warm from the soul, and faithful to its fires;
The virgin's wish without her fears impart,
Excuse the blush, and pour out all the heart;
Speed the soft intercourse from soul to soul,
And waft a sigh from Indus to the pole.

Eloisa to Abelard, l. 51.

These thoughts are pretty: they suit Pope, but not Eloisa.

Satan, enraged by a threatening of the angel Gabriel, answers thus:

Then when I am thy captive, talk of chains,
Proud limitary cherub; but ere then
Far heavier load thyself expect to feel
From my prevailing arm, though heaven's King
Ride

Ride on thy wings, and thou with thy compeers,
Us'd to the yoke, draw'st his triumphant wheels
In progress thro' the road of heav'n *star-pav'd*.
Paradise Lost, B. IV.

The concluding epithet forms a grand and delightful image, which cannot be the genuine offspring of rage.

4. Sentiments too artificial for a serious passion. The first example is a speech of Percy expiring.

O, Harry, thou hast robb'd me of my growth:
I better brook the loss of brittle life,
Than those proud titles thou hast won of me.
They wound my thoughts worse than thy sword my flesh.
But thought's the slave of life, and life time's fool;
And time, that takes survey of all the world;
Must have stop.
First Part, Henry IV. Act V. sc. 9.

The sentiments of the *Mourning Bride* are for the most part no less delicate than just copies of nature: in the following exception the picture is beautiful, but too artful to be suggested by severe grief.

Almeria. O no! Time gives increase to my afflictions.
The circling hours, that gather all the woes
Which are diffus'd through the revolving year,
Come heavy laden with th' oppressive weight
To me; with me, successively, they leave
The sighs, the tears, the groans, the restless cares,
And all the damps of grief, that did retard their flight;
They shake their downy wings, and scatter all
The dire collected dews on my poor head;
Then fly with joy and swiftness from me. Act I. sc. 1.

In the same play, Almeria seeing a dead body, which she took to be Alphonso's, expresses sentiments strained and artificial, which nature suggests not to any person upon such an occasion:

Had they or hearts or eyes, that did this deed?
Could eyes endure to guide such cruel hands?
Are not my eyes guilty alike with theirs,
That thus can gaze, and yet not turn to stone?
—I do not weep! The springs of tears are dry'd,
And of a sudden I am calm, as if
All things were well; and yet my husband's murder'd!
Yes, yes, I know to mourn: I'll sluice this heart,
The source of wo, and let the torrent in.
Act V. sc. 11.

Pope's elegy to the memory of an unfortunate lady, expresses delicately the most tender concern and sorrow that one can feel for the deplorable fate of a person of worth. Such a poem, deeply serious and pathetic, rejects with disdain all fiction. Upon that account, the following passage deserves no quarter; for it is not the language of the heart, but of the imagination indulging its flights at ease, and by that means is eminently discordant with the subject. It would be a still more severe censure, if it should be ascribed to imitation, copying indiscreetly what has been said by others:

What tho' no weeping loves thy ashes grace,
Nor polish'd marble emulate thy face?
What though no sacred earth allow thee room,
Nor hallow'd dirge be mutter'd o'er thy tomb?
Yet shall thy grave with rising flow'rs be drest,
And the green turf lie lightly on thy breast:
There shall the morn her earliest tears bestow,
There the first roses of the year shall blow;
While angels with their silver wings o'ershade
The ground, now sacred by thy relics made.

5. Fanciful or finical sentiments. Sentiments that degenerate into point or conceit, however they may amuse in an idle hour, can never be the offspring of any serious or important passion. In the *Jerusalem* of Tasso, Tancred, after a single combat, spent with fatigue, and loss of blood, falls into a swoon; in which situation, understood to be dead, he is discovered by Erminia, who was in love with him to distraction. A more happy situation cannot be imagined, to raise grief in an instant to its highest pitch; and yet, in venting her sorrow, she descends most abominably into antithesis and conceit even of the lowest kind:

E in lui versò d'inefficabil vena
Lacrime, e voce di sospiri mista.
In che misero punto hor qui me mena
Fortuna? a che veduta amara e trista?
Dopo gran tempo i' ti ritrovo à pena
Tancredi, e ti riveggio, e non son vista
Vista non son da te, benche presente
T trovando ti perdo eternamente.
Canto XIX. st. 105.

Armida's lamentation respecting her lover Rinaldo is in the same vicious taste. *Vid.* Canto XX. stan. 124, 125, 126.

Queen. Give me no help in lamentation,
I am not barren to bring forth complaints:
All springs reduce their currents to mine eyes,
That I, being govern'd by the wat'ry moon,
May send forth plenteous tears to drown the world,
Ah, for my husband, for my dear Lord Edward.
King Richard III. Act. 2. sc. 2.

Jane Shore utters her last breath in a witty conceit:

Then all is well, and I shall sleep in peace——
'Tis very dark, and I have lost you now——
Was there not something I would have bequeath'd you?
But I have nothing left me to bestow,
Nothing but one sad sigh. Oh mercy, Heav'n! [*Dies.*
Act V.

Guilford to Lady Jane Gray, when both were condemned to die:

Thou stand'st unmov'd;
Calm temper sits upon thy beauteous brow;
Thy eyes that flow'd so fast for Edward's loss,
Gaze unconcern'd upon the ruin round thee,
As if thou had'st resolv'd to brave thy fate,
And triumph in the midst of desolation.
Ha! see, it swells, the liquid crystal rises,
It starts in spite of thee——but I will catch it,
Nor let the earth be wet with dew so rich.
Lady Jane Gray, Act IV. near the end.

The concluding sentiment is altogether finical, unsuitable to the importance of the occasion, and even to the dignity of the passion of love.

Corneille,

Sentiments.

Corneille, in his *Examen of the Cid*, anſwering an objection, That his ſentiments are ſometimes too much refined for perſons in deep diſtreſs, obſerves, that if poets did not indulge ſentiments more ingenious or refined than are prompted by paſſion, their performances would often be low, and extreme grief would never ſuggeſt but exclamations merely. This is in plain language to aſſert, that forced thoughts are more agreeable than thoſe that are natural, and ought to be preferred.

The *ſecond* claſs is of ſentiments that may belong to an ordinary paſſion, but are not perfectly concordant with it, as tinctured by a ſingular character.

In the laſt act of that excellent comedy *The Careleſs Huſband*, Lady Eaſy, upon Sir Charles's reformation, is made to expreſs more violent and turbulent ſentiments of joy than are conſiſtent with the mildneſs of her character.

Lady Eaſy. O the ſoft treaſure! O the dear reward of long deſiring love.—Thus! thus to have you mine, is ſomething more than happineſs; 'tis double life, and madneſs of abounding joy.

The following inſtances are deſcriptions rather than ſentiments, which compoſe a *third* claſs.

Of this deſcriptive manner of painting the paſſions, there is in the *Hippolytus* of Euripides, *Act V.* an illuſtrious inſtance, viz. the ſpeech of Theſeus, upon hearing of his ſon's diſmal exit. In Racine's tragedy of *Eſther*, the queen hearing of the decree iſſued againſt her people, inſtead of expreſſing ſentiments ſuitable to the occaſion, turns her attention upon herſelf, and deſcribes with accuracy her own ſituation.

Juſte ciel! tout mon ſang dans mes veines ſe glace.
Act I. ſc. 3.

Again,

Aman. C'en eſt fait. Mon orgueil eſt forcé de plier.
L'inexorable Aman eſt reduit à prier.
Eſther, Act III. ſc. 5.

Athalie. Quel prodige nouveau me trouble et m'embarraſſe?
La douceur de ſa voix, ſon enfance, ſa grace,
Font inſenſiblement a mon inimitié
Succeder—Je ſerois ſenſible a la pitié?
Athalie, Act II. ſc. 7.

Titus. O de ma paſſion fureur deſeſperée!
Brutus of Voltaire, Act III. ſc. 6.

What other are the foregoing inſtances but deſcribing the paſſion another feels?

The *fourth* claſs is of ſentiments expreſſed too early or too late.

Some examples mentioned above belong to this claſs. Add the following from *Venice Preſerv'd*, Act V. at the cloſe of the ſcene between Belvidera and her father Priuli. The account given by Belvidera of the danger ſhe was in, and of her huſband threatening to murder her, ought naturally to have alarmed her relenting father, and to have made him expreſs the moſt perturbed ſentiments. Inſtead of which he diſſolves into tenderneſs and love for his daughter, as if he had already delivered her from danger, and as if there were a perfect tranquillity.

Canſt thou forgive me all my follies paſt!
I'll henceforth be indeed a father; never,
Never more thus expoſe, but cheriſh thee,
Dear as the vital warmth that feeds my life,
Dear as thoſe eyes that weep in fondneſs o'er thee:
Peace to thy heart.

Immoral ſentiments expoſed in their native colours, inſtead of being concealed or diſguiſed, compoſe the *fifth* claſs.

The Lady Macbeth, projecting the death of the king, has the following ſoliloquy:

————The raven himſelf's not hoarſe
That croaks the fatal entrance of Duncan
Under my battlements. Come, all you ſpirits
That tend on mortal thoughts, unſex me here,
And fill me from the crown to the toe, top full
Of direct cruelty; make thick my blood,
Stop up th' acceſs and paſſage to remorſe,
That no compunctious viſitings of nature
Shake my fell purpoſe. *Macbeth*, Act. I. ſc. 7.

This ſpeech is not natural. A treacherous murder was never perpetrated even by the moſt hardened miſcreant without compunction; and that the lady here muſt have been in horrible agitation, appears from her invoking the infernal ſpirits to fill her with cruelty, and to ſtop up all avenues to remorſe. But in that ſtate of mind it is a never-failing artifice of ſelf-deceit to draw the thickeſt veil over the wicked action, and to extenuate it by all the circumſtances that imagination can ſuggeſt: and if the crime cannot bear diſguiſe, the next attempt is to thruſt it out of mind altogether, and to ruſh on to action without thought. This laſt was the huſband's method.

Strange things I have in head, that will to hand;
Which muſt be acted ere they muſt be ſcann'd.
Act III. ſc. 5.

The lady follows neither of theſe courſes, but in a deliberate manner endeavours to fortify her heart in the commiſſion of an execrable crime, without even attempting to colour it. This we think, is not natural; we hope there is no ſuch wretch to be found as is here repreſented.

The *laſt* claſs comprehends ſentiments that are unnatural, as being ſuited to no character nor paſſion. Theſe may be ſubdivided into three branches: firſt, ſentiments unſuitable to the conſtitution of man, and to the laws of his nature: ſecond, inconſiſtent ſentiments; third, ſentiments that are pure rant and extravagance.

When the fable is of human affairs, every event, every incident, and every circumſtance, ought to be natural, otherwiſe the imitation is imperfect. But an imperfect imitation is a venial fault, compared with that of running croſs to nature. In the *Hippolytus* of Euripides, (*Act IV. ſc.* 5.), Hippolytus wiſhing for another ſelf in his own ſituation, "How much (ſays he) ſhould I be touched with his misfortune!" as if it were natural to grieve more for the misfortunes of another than for one's own.

Oſmyn. Yet I beheld her—yet—and now no more.
Turn your lights inward, eyes, and view my thought:
So ſhall you ſtill behold her—'Twill not be.

O

O impotence of sight! mechanic sense,
Which to exterior objects ow'st thy faculty,
Not seeing of election, but necessity.
Thus do our eyes, as do all common mirrors,
Successively reflect succeeding images,
Nor what they would, but must; a star or toad;
Just as the hand of chance administers!

Mourning Bride, Act II. sc. 8.

No man, in his senses, ever thought of applying his eyes to discover what passes in his mind; far less of blaming his eyes for not seeing a thought or idea. In Moliere's *l'Avare* (Act IV. sc. 7.) Harpagon, being robbed of his money, seizes himself by the arm, mistaking it for that of the robber. And again he expresses himself as follows:

Je veux aller querir la justice, et faire donner la question à toute ma maison; à servantes, à valets, à fils, à fille, et à moi aussi.

This is so absurd as scarce to provoke a smile, if it be not at the author.

Of the second branch the following example may suffice:

——— Now bid me run,
And I will strive with things *impossible*,
Yea, get the better of them.

Julius Cæsar, Act. II. sc. 3.

Of the third branch, take the following samples. Lucan, talking of Pompey's sepulchre.

——— Romanum nomen, et omne
Imperium magno est tumuli modus. Obrue saxa
Crimine plena deûm. Si tota est Herculis Oete,
Et juga tota vacant Bromio Nyseia; quare
Unus in Egypto Magno lapis? Omnia Lagi
Rura tenere potest, si nullo cespite nomen
Hæserit. Erremus populi, cinerumque tuorum,
Magne, metu nullas Nili calcemus arenas.

Lib. VIII. l. 798.

Thus, in Rowe's traslation:

Where there are seas, or air, or earth, or skies,
Where'er Rome's empire stretches, Pompey lies.
Far be the vile memorial then convey'd!
Nor let this stone the partial gods upbraid.
Shall Hercules all Octa's heights demand,
And Nysa's hill for Bacchus only stand;
While one poor pebble is the warrior's doom
That fought the cause of liberty and Rome?
If Fate decrees he must in Egypt lie,
Let the whole fertile realm his grave supply,
Yield the wide country to his awful shade,
Nor let us dare on any part to tread,
Fearful we violate the mighty dead.

The following passages are pure rant. Coriolanus, speaking to his mother,

What is this?
Your knees to me? to your corrected son?
Then let the pebbles on the hungry beach
Fillop the stars: then let the mutinous winds
Strike the proud cedars 'gainst the fiery sun:
Murd'ring impossibility, to make
What cannot be, slight work.

Coriolanus, Act V. sc. 3.

Cæsar. ——— Danger knows full well,
That Cæsar is more dangerous than he.
We were two lions litter'd in one day,
And I the elder and more terrible.

Julius Cæsar, Act II. sc. 4.

Ventidius. But you, ere love missed your wand'ring eyes,
Were sure the chief and best of human race,
Fram'd in the very pride and boast of nature,
So perfect, that the gods who form'd you wonder'd
At their own skill, and cry'd, A lucky hit
Has mended our design. *Dryden, All for Love*, Act I.

Not to talk of the impiety of this sentiment, it is ludicrous instead of being lofty.

The famous epitaph on Raphael is not less absurd than any of the foregoing passages:

Raphael, timuit, quo sospite, vinci,
Rerum magna parens, et moriente mori.

Imitated by Pope, in his epitaph on Sir Godfrey Kneller:

Living, great Nature fear'd he might outvie
Her works; and dying, fears herself may die.

Such is the force of imitation; for Pope of himself would never have been guilty of a thought so extravagant.

SENTINEL, or SENTRY, in military affairs, a private soldier placed in some post to watch the approach of the enemy, to prevent surprises, to stop such as would pass without orders or discovering who they are. They are placed before the arms of all guards, at the tents and doors of general officers, colonels of regiments, &c.

SENTINEL *Perdu*, a soldier posted near an enemy, or in some very dangerous post where he is in hazard of being lost.

All sentinels are to be vigilant on their posts; neither are they to sing, smoke tobacco, nor suffer any noise to be made near them. They are to have a watchful eye over the things committed to their charge. They are not to suffer any light to remain, or any fire to be made, near their posts in the night time; neither is any sentry to be relieved or removed from his post but by the corporal of the guard. They are not to suffer any one to touch or handle their arms, or in the night-time to come within ten yards of their post.

No person is to strike or abuse a sentry on his post; but when he has committed a crime, he is to be relieved, and then punished according to the rules and articles of war.

A sentinel, on his post in the night, is to know nobody but by the counter-sign: when he challenges, and is answered *Relief*, he calls out, *Stand, relief! advance, corporal!* upon which the corporal halts his men, and advances alone within a yard of the sentry's firelock (first ordering his party to rest, on which the sentry does the same), and gives him the counter-sign, taking care that no one hear it.

SEPIA, the CUTTLE-FISH, a genus belonging to the order of vermes mollusca. There are eight brachia interspersed on the interior side, with little round serrated cups, by the contraction of which the animal lays fast hold of any thing. Besides these eight arms,

it

Sepia. it has two tentacula longer than the arms, and frequently pedunculated. The mouth is situated in the centre of the arms, and is horny and hooked, like the bill of a hawk. The eyes are below the tentacula, towards the body of the animal. The body is fleshy, and received into a sheath as far as the breast. Their food are tonnies, sprats, lobsters, and other shell-fish. With their arms and trunks they fasten themselves, to resist the motion of the waves. Their beak is like that of a parrot. The females are distinguished by two paps. They copulate as the polypi do, by a mutual embrace, and lay their eggs upon sea-weed and plants, in parcels like bunches of grapes. Immediately after they are laid they are white, and the males pass over and impregnate them with a black liquor, after which they grow larger. On opening the egg, the embyro-cuttle is found alive. The males are very constant, accompany their females everywhere, face every danger in their defence, and rescue them intrepidly at the hazard of their own lives. The timorous females fly as soon as they see the males wounded. The noise of a cuttle-fish, on being dragged out of the water resembles the grunting of a hog. When the male is pursued by the sea-wolf or other ravenous fish, he shuns the danger by stratagem. He squirts his black liquor, sometimes to the quantity of a dram, by which the water becomes black as ink, under shelter of which he baffles the pursuit of his enemy. This ink or black liquor has been denominated by Mr le Cat *æthiops animal*, and is reserved in a particular gland. In its liquid state it resembles that of the choroid in man, and would then communicate an indelible dye; when dry, it might be taken for the product of the black liquor in negroes dried, and made a precipitate by spirit of wine. This æthiops animal in negroes as well as in the cuttle-fish, is more abundant after death than even during life. It may serve either for writing or printing; in the former of which ways the Romans used it. It is said to be an ingredient in the composition of Indian ink mixed with rice. There are five species.

1. The loligo, or great cuttle, with short arms and long tentacula; the lower part of the body rhomboid and pinnated, the upper thick and cylindric. They inhabit all our seas, where having blackened the water by the effusion of their ink, they abscond, and with their tail leap out of the water. They are gregarious and swift in their motions: they take their prey by means of their arms; and embracing it, bring it to their central mouth. They adhere to the rocks, when they wish to be quiescent, by means of the concave discs that are placed along their arms.

2. The octopodia, with eight arms, connected at their bottom by a membrane. This is the polypus of Pliny, which he distinguishes from the loligo and sepia by the want of the tail and tentacula. They inhabit our seas, but are most at home in the Mediterranean. In hot climates these are found of an enormous size. The Indians affirm, that some have been seen two fathoms broad, over their centre, and each arm nine fathoms long. When the Indians navigate their little boats, they go in dread of them; and lest these animals should fling their arms over and sink them, they never sail without an axe to cut them off. When used for food they are served up red from their own liquor, which from boiling with the addition of nitre becomes red. Barthol, says, upon cutting one of them open, so great a light broke forth, that at night, upon taking away the candle, the whole house seemed to be in a blaze.

3. The media, or middle cuttle, with a long, slender, cylindric body; tail finned, pointed, and carinated on each side; two long tentacula; the body almost transparent, green, but convertible into a dirty brown: confirming the remark of Pliny, that they change their colour through fear, adapting it, chameleon-like, to that of the place they are in. The eyes are large and smaragdine.

4. The sepiola, or small cuttle, with a short body, rounded at the bottom, has a round fin on each side and two tentacula. They are taken off Flintshire, but chiefly inhabit the Mediterranean.

5. The officinalis, or officinal cuttle, with an ovated body, has fins along the whole of the sides, almost meeting at the bottom; and two long tentacula. The body contains the bone, the cuttle-bone of the shops, which was formerly used as an absorbent. The bones are frequently flung on all our shores; the animal very rarely. The conger eels bite off their arms, or feet; but they grow again, as does the lizard's tail, (Plin. IX. 29). They are preyed upon by the plaice. This fish emits (in common with the other species), when frighted or pursued, the black liquor which the ancients supposed darkened the circumambient waves, and concealed it from the enemy.

The endanger'd cuttle thus evades his fears,
And native hoards of fluid safety bears.
A pitchy ink peculiar glands supply,
Whose shades the sharpest beam of light defy.
Pursu'd, he bids the sable fountains flow,
And, wrapt in clouds, eludes th' impending foe,
The fish retreats unseen, while self-born night,
With pious shade befriends her parent's flight.

The ancients sometimes made use of it instead of ink. Persius mentions the species in his description of the noble student.

Jam liber, et bicolor positis membrana capillis,
Inque manus chartæ, nodasque venit arundo.
Tum querimur, crassus calamo quod pendeat humor;
Nigra quod infusa venescat sepia *lympha.*

At length, his book he spreads, his pen he takes;
His papers here in learned order lays,
And there his parchment's smoother side displays.
But oh! what crosses wait on studious men!
The *cuttle*'s joice hangs clotted at our pen.
In all my life such stuff I never knew,
So gummy thick—Dilute it, it will do.
Nay, now 'tis water! DRYDEN.

This animal was esteemed a delicacy by the ancients, and is eaten even at present by the Italians. Rondeletius gives us two receipts for the dressing, which may be continued to this day. Athenæus also leaves us the method of making an antique cuttle-fish sausage; and we learn from Aristotle, that those animals are in highest season when pregnant.

Sepia, Sepiariæ. SEPIARIÆ, from *sepes*, "a hedge"), the name of the 44th order of Linnæus's Fragments of a Natural Method,

Method, consisting of a beautiful collection of woody plants, some of which, from their size and elegance, are very proper furniture for hedges. See BOTANY, p. 467.

SEPS, in zoology, a species of LACERTA.

SEPTARIÆ, in natural history, a large class of fossils, commonly known by the names of *ludus Helmontii* and *waxen veins*.

They are defined to be fossils not inflammable, nor soluble in water; of a moderately firm texture and dusky hue, divided by several septa or thin partitions, and composed of a sparry matter greatly debased by earth; not giving fire with steel; fermenting with acids, and in great part dissolved by them; and calcining in a moderate fire.

Of this class there are two distinct orders of bodies, and under those six genera. The septariæ of the first order are those which are usually found in large masses, of a simple uniform construction, but divided by large septa either into larger and more irregular portions, or into smaller and more equal ones, called *taic.* The genera of this order are four. 1. Those divided by septa of spar, called *scomiæ:* 2. Those divided by septa of earthy matter, called *gaiophragmia:* 3. Those divided by septa of the matter of the pyrites, called *pyriteria:* And, 4. Those divided by septa of spar, with an admixture of crystal, called *diaugophragmia.*

Those of the second order are such as are usually found in smaller masses, of a crustated structure, formed by various incrustations round a central nucleus, and divided by very thin septa. Of this order are only two genera. 1. Those with a short roundish nucleus, enclosed within the body of the mass; and, 2. Those with a long nucleus, standing out beyond the ends of the mass.

SEPTAS, in botany: A genus of plants belonging to the order of *Heptagynia*, and the class of *Heptandria;* and in the natural system ranged under the 13th order, *Succulentæ.* The calyx is divided into seven parts; the petals are seven; the germens seven: the capsules are also seven, and contain many seeds. There is only one species, the *Capensis*, which is a native of the Cape of Good Hope, is round-leaved, and flowers in August or September.

SEPTEMBER, the ninth month of the year, consisting of only thirty days; it took its name as being the seventh month, reckoning from March, with which the Romans began their year.

SEPTENNIAL, any thing lasting seven years.

SEPTENNIAL *Elections.* Blackstone, in his Commentaries, Vol. I. p. 189. says, (after observing that the utmost extent of time allowed the same parliament to sit by the stat. 6 W. and M. c. 2. was three years), "But, by the statute 1 Geo. I. st. 2. c. 38. (in order *professedly* to prevent the great and continued expences of frequent elections, and the violent heats and animosities consequent thereupon, and for the peace and security of the government, just then recovering from the late rebellion), this term was prolonged to seven years; and what alone is an instance of the vast authority of parliament, the very same house that was chosen for three years enacted its own continuance for seven."

SEPTENTRIO, in astronomy, a constellation, more usually called *ursa minor.*

In cosmography, the term *septentrio* denotes the same with *north:* and hence septentrional is applied to any thing belonging to the north; as *septentrional signs, parallels*, &c.

SEPTICS, are those substances which promote putrefaction, chiefly the calcareous earths, magnesia, and testaceous powders. From the many curious experiments made by Sir John Pringle to ascertain the *septic* and *antiseptic* virtues of natural bodies, it appears that there are very few substances of a truly *septic* nature. Those commonly reputed such by authors, as the alkaline and volatile salts, he found to be unwise *septic.* However, he discovered some, where it seemed least likely to find any such quality; these were chalk, common salt, and testaceous powders. He mixed twenty grains of crabs eyes, prepared with six drachms of ox's gall, and an equal quantity of water. Into another phial he put an equal quantity of gall and water, but no crabs-eyes. Both these mixtures being placed in the furnace, the putrefaction began much sooner, where the powder was, than in the other phial. On making a like experiment with chalk, its *septic* virtue was found to be much greater than that of the crabs-eyes: nay, what the doctor had never met with before, in a mixture of two drachms of flesh, with two ounces of water and thirty grains of prepared chalk, the flesh was resolved into a perfect mucus in a few days.

To try whether the testaceous powders would also dissolve vegetable substances, the doctor mixed them with barley and water, and compared this mixture with another of barley and water alone. After a long maceration by a fire, the plain water was found to swell the barley, and turn mucilaginous and sour; but that with the powder kept the grain to its natural size, and though it softened it, yet made no mucilage, and remained sweet.

Nothing could be more unexpected, than to find sea salt a hastener of putrefaction; but the fact is thus; one drachm of salt preserves two drachms of fresh beef in two ounces of water, above thirty hours uncorrupted, in a heat equal to that of the human body; or, which is the same thing, this quantity of salt keeps flesh sweet twenty hours longer than pure water; but then half a drachm of salt does not preserve it above two hours longer. Twenty-five grains have little or no antiseptic virtue, and ten, fifteen, or even twenty grains, manifestly both hasten and heighten the corruption. The quantity which had the most putrefying quality, was found to be about ten grains to the above proportion of flesh and water.

Many inferences might be drawn from this experiment: one is, that since salt is never taken in aliment beyond the proportion of the corrupting quantities, it would appear that it is subservient to digestion chiefly by its *septic* virtue, that is, by softening and resolving meats; an action very different from what is commonly believed.

It is to be observed, that the above experiments were made with the salt kept for domestic uses. See Pringle's Observ. on the Diseases of the Army, p. 348, et seq.

SEPTIZON, or SEPTIZONIUM, in Roman antiquity, a celebrated mausoleum, built by Septimus Severus, in the tenth region of the city of Rome: it was so called

Septuagesima, Septuagint.

called from *septem* and *zona*, by reason it consisted of seven stories, each of which was surrounded by a row of columns.

SEPTUAGESIMA, in the kalendar, denotes the third Sunday before Lent, or before Quadragesima Sunday: supposed by some to take its name from its being about seventy days before Easter.

SEPTUAGINT, the name given to a Greek version of the books of the Old Testament, from its being supposed to be the work of seventy-two Jews, who are usually called the *seventy interpreters*, because seventy is a round number.

The history of this version is expressly written by Aristæas, an officer of the guards to Ptolemy Philadelphus, the substance of whose account is as follows: Ptolemy having erected a fine library at Alexandria, which he took care to fill with the most curious and valuable books from all parts of the world, was informed that the Jews had one containing the laws of Moses, and the history of that people; and being desirous of enriching his library with a Greek translation of it, applied to the high-priest of the Jews; and to engage him to comply with his request, set at liberty all the Jews whom his father Ptolemy Soter had reduced to slavery. After such a step, he easily obtained what he desired; Eleazar the Jewish high priest sent back his ambassadors with an exact copy of the Mosaical law, written in letters of gold, and six elders of each tribe, in all seventy two; who were received with marks of respect by the king, and then conducted into the isle of Pharos, where they were lodged in a house prepared for their reception, and supplied with every thing necessary. They set about the translation without loss of time, and finished it in seventy-two days: and the whole being read in the presence of the king, he admired the profound wisdom of the laws of Moses; and sent back the deputies laden with presents, for themselves, the high priest, and the temple.

Aristobulus, who was tutor to Ptolemy Physcon, Philo who lived in our Saviour's time, and was contemporary with the apostles, and Josephus, speak of this translation as made by 72 interpreters, by the care of Demetrius Phalereus, in the reign of Ptolemy Philadelphus. All the Christian writers, during the first 15 centuries of the Christian era, have admitted this account of the Septuagint as an undoubted fact. But since the Reformation, critics have boldly called it in question, because it was attended with circumstances which they think inconsistent, or, at least, improbable. Du Pin has asked, why were 72 interpreters employed, since 12 would have been sufficient? Such an objection is trifling. We may as well ask, why did King James I. employ 54 translators in rendering the Bible into English, since Du Pin thinks 12 would have been sufficient?

1. Prideaux objects, that the Septuagint is not written in the Jewish, but in the Alexandrian dialect; and could not therefore be the work of natives of Palestine. But these dialects were probably at that time the same, for both Jews and Alexandrians had received the Greek language from the Macedonians about 50 years before.

2. Prideaux farther contends, that all the books of the Old Testament could not be translated at the same time; for they exhibit great difference of style. To this it is sufficient to reply, that they were the work of 72 men, each of whom had separate portions assigned them.

3. The Dean also urges, that Aristæas, Aristobulus, Philo, and Josephus, all directly tell us, that the law was translated without mentioning any of the other sacred books. But nothing was more common among writers of the Jewish nation than to give this name to the Scriptures as a whole. In the New Testament law is used as synonymous with what we call the Old Testament. Besides, it is expressly said by Aristobulus, in a fragment quoted by Eusebius (*Prep. Evan.* l. 1.), that the whole Sacred Scripture was rightly translated through the means of Demetrius Phalereus, and by the command of Philadelphus. Josephus indeed, says the learned Dean, asserts, in the preface to his Antiquities, that the Jewish interpreters did not translate for Ptolemy the whole Scriptures, but the law only. Here the evidence is contradictory, and we have to determine, whether Aristobulus or Josephus be most worthy of credit. We do not mean, however, to accuse either of forgery, but only to inquire which had the best opportunities of knowing the truth. Aristobulus was an Alexandrian Jew, tutor to an Egyptian king, and lived within 100 years after the translation was made, and certainly had access to see it in the royal library. Josephus was a native of Palestine, and lived not until 300 years or more after the translation was made, and many years after it was burnt along with the whole library of Alexandria in the wars of Julius Cæsar. Supposing the veracity of these two writers equal, as we have no proof of the contrary, which of them ought we to consider as the best evidence? Aristobulus surely. Prideaux, indeed, seems doubtful whether there was ever such a man; and Dr Hody supposes that the Commentaries on the five books of Moses, which bear the name of Aristobulus, were a forgery of the second century. To prove the existence of any human being, who lived 2000 years before us, and did not perform such works as no mere man ever performed, is a task which we are not disposed to undertake; and we believe it would not be less difficult to prove that Philo and Josephus existed, than that such a person as Aristobulus did not exist. If the writings which have passed under his name were a forgery of the second century, it is surprising that they should have imposed upon Clemens Alexandrinus, who lived in the same century, and was a man of abilities, learning, and well acquainted with the writings of the ancients. Eusebius, too, in his *Prep. Evan.* quotes the commentaries of Aristobulus. But, continues the learned Dean, "Clemens Alexandrinus is the first author that mentions them. Now, had any such commentaries existed in the time of Philo and Josephus, they would surely have mentioned them. But is the circumstance of its not being quoted by every succeeding author a sufficient reason to disprove the authenticity of any book? Neither Philo nor Josephus undertook to give a list of preceding authors, and it was by no means the uniform practice of these times always to name the authors from whom they derived their information."

4. Prideaux farther contends, that the sum which Ptolemy is said to have given to the interpreters is too great to be credible. If his computation were just, it certainly would be so. He makes it 2,000,000l. sterling,

Sterling, but other writers * reduce it to 85,421l. and some to 56,947l.; neither of which is a sum so very extraordinary in so great and magnificent a prince as Philadelphus, who spent, according to a passage in Athenæus (Lib. V.), no less than 10,000 talents on the furniture of one tent; which is six times more than what was spent in the whole of the embassy and translation, which amounted only to 1552 talents.

5. Prideaux says, "that what convicts the whole story of Aristeas of falsity is, that he makes Demetrius Phalereus to be the chief actor in it, and a great favourite of the king; whereas Philadelphus, as soon as his father was dead, cast him into prison, where he soon after died." But it may be replied, that Philadelphus reigned two years jointly with his father Lagus, and it is not said by Hermippus that Demetrius was out of favour with Philadelphus during his father's life. Now, if the Septuagint was translated in the beginning of the reign of Philadelphus, as Eusebius and Jerome think, the difficulty will be removed. Demetrius might have been librarian during the reign of Philadelphus, and yet imprisoned on the death of Lagus. Indeed, as the cause of Philadelphus's displeasure was the advice which Demetrius gave to his father, to prefer the sons of Arsinoe before the son of Berenice, he could scarcely show it till his father's death. The Septuagint translation might therefore be begun while Philadelphus reigned jointly with his father, but not be finished till after his father's death.

6. Besides the objections which have been considered, there is only one that deserves notice. The ancient Christians not only differ from one another concerning the time in which Aristobulus lived, but even contradict themselves in different parts of their works. Sometimes they tell us, he dedicated his book to Ptolemy Philometer, at other times they say, it was addressed to Philadelphus and his father. Sometimes they make him the same person who is mentioned in 2 Maccabees, chap. 1. and sometimes one of the 72 interpreters 152 years before. It is difficult to explain how authors fall into such inconsistencies, but it is probably occasioned by their quoting from memory. This was certainly the practice of almost all the early Christian writers, and sometimes of the apostles themselves. Mistakes were therefore inevitable. Josephus has varied in the circumstances of the same event, in his antiquities and wars of the Jews, probably from the same cause; but we do not hence conclude, that every circumstance of such a relation is entirely false. In the account of the marquis of Argyll's death in the reign of Charles II. we have a very remarkable contradiction. Lord Clarendon relates, that he was condemned to be hanged, which was performed the same day: on the contrary, Burnet, Woodrow, Heath, Echard, concur in stating, that he was beheaded; and that he was condemned upon the Saturday and executed upon the Monday †. Was any reader of English history every sceptic enough to raise from hence a question, whether the marquis of Argyll was executed or not? Yet this ought to be left in uncertainty according to the way of reasoning in which the facts respecting the translation of the Septuagint is attempted to be disproved.

Such are the objections which the learned and ingenious Prideaux has raised against the common account of the Septuagint translation, and such are the answers which may be given to them. We have chosen to support that opinion which is sanctioned by historical evidence, in preference to the conjectures of modern critics however ingenious; being persuaded, that there are many things recorded in history, which, though perfectly true, yet, from our imperfect knowledge of the concomitant circumstances, may, at a distant period, seem liable to objections. To those who require positive evidence, it may be stated thus: Aristeas, Aristobulus, Philo, and Josephus, assure us, that the law was translated. Taking the law in the most restricted sense, we have at least sufficient authority to assert, that the Pentateuch was rendered into Greek under Ptolemy Philadelphus. Aristobulus affirms, that the whole Scriptures were translated by the 72. Josephus confines their labours to the books of Moses. He therefore who cannot determine to which of the two the greatest respect is due, may suspend his opinion. It is certain, however, that many of the other books were translated before the age of our Saviour; for they are quoted both by him and his apostles: and, perhaps, by a minute examination of ancient authors, in the same way that Dr Lardner has examined the Christian fathers to prove the antiquity of the New Testament, the precise period in which the whole books of the Septuagint were composed might, with considerable accuracy, be ascertained.

For 400 years this translation was in high estimation with the Jews. It was read in their synagogues in preference to the Hebrew; not only in those places where Greek was the common language, but in many synagogues of Jerusalem and Judea. But when they saw that it was equally valued by the Christians, they became jealous of it, and at length, in the second century, Aquila, an apostate Christian, attempted to substitute another Greek translation in its place. In this work he was careful to give the ancient prophecies concerning the Messiah a different turn from the Septuagint, that they might not be applicable to Christ. In the same design he was followed by Symmachus and Theodotion, who also, as St Jerome informs us, wrote out of hatred to Christianity.

In the mean time, the Septuagint, from the ignorance, boldness, and carelessness of transcribers, became full of errors. To correct these, Origen published a new edition in the beginning of the third century, in which he placed the translations of Aquila, Symmachus, and Theodotion. This edition was called *Tetrapla*, the translations being arranged opposite to one another in four columns. He also added one column, containing the Hebrew text in Hebrew letters, and another exhibiting it in Greek. In a second edition he published two additional Greek versions; one of which was found at Nicopolis, and the other at Jericho: this was called the *Hexapla*. By comparing so many translations, Origen endeavoured to form a correct copy of the Scriptures. Where they all agreed, he considered them right. The passages which he found in the LXX, but not in the Hebrew text, he marked with an obelisk: what he found in the Hebrew, but not in the LXX, he marked with an asterisk. St Jerome says, that the additions which Origen made to the LXX, and marked with an asterisk, were taken from Theodotion. From this valuable work of Origen the version of the LXX was transcribed in a separate volume, with the asterisks and obelisks

Septuagint. obelisks for the use of the churches; and from this circumstance the great work itself was neglected and lost.

About the year 300 two new editions of the LXX were published; the one by Hesychius an Egyptian bishop, and the other by Lucian a presbyter of Antioch. But as these authors did not mark with any note of distinction the alterations which they had made, their edition does not possess the advantages of Origen's.

The best edition of the LXX is that of Dr Grabe, which was published in the beginning of the present century. He had access to two MSS, nearly of equal antiquity, the one found in the Vatican library at Rome, the other in the Royal library at St James's, which was presented to Charles I. by Cyril, patriarch of Alexandria, and hence is commonly called the *Alexandrian MS.* Anxious to discover which of these was according to the edition of Origen, Dr Grabe collected the fragments of the Hexapla, and found they agreed with the Alexandrian MS. but not with the Vatican where it differed with the other. Hence he concluded that the Alexandrian MS. was taken from the edition of Origen. By comparing the quotations from scripture in the works of Athanasius and St Cyril (who were patriarchs of Alexandria at the time St Jerome says Hesychius's edition of the LXX was there used) with the Vatican MS. he found they agreed so well that he justly inferred that that MS. was taken from the edition of Hesychius.

This version was in use to the time of our blessed Saviour, and is that out of which most of the citations in the New Testament, from the Old, are taken. It was also the ordinary and canonical translation made use of by the Christian church in the earliest ages; and it still subsists in the churches both of the east and west.

Those who desire a more particular account of the Septuagint translation may consult Hody *de Bibliorum Textibus*, Prideaux's Connexions, Owen's Inquiry into the Septuagint Version, Blair's Lectures on the Canon, and Michaelis's Introduction to the New Testament, last edition.

Septuagint Chronology, the chronology which is formed from the dates and periods of time mentioned in the Septuagint translation of the Old Testament. It reckons 1500 years more from the creation to Abraham than the Hebrew bible. Dr Kennicot, in the dissertation prefixed to his Hebrew bible, has shown it to be very probable that the chronology of the Hebrew scriptures, since the period just mentioned, was corrupted by the Jews, between the years 175 and 200, and that the chronology of the Septuagint is more agreeable to truth. It is a fact, that during the second and third centuries the Hebrew scriptures were almost entirely in the hands of the Jews, while the Septuagint was confined to the Christians. The Jews had therefore a very favourable opportunity for this corruption. The following is the reason which is given by oriental writers: It being a very ancient tradition, that the Messiah was to come in the sixth chiliad, because he was to come in the last days (founded on a mystical application of the six days creation), the contrivance was *to shorten the age of the world from about 5500 to 3760; and thence to prove that Jesus could not be the Messiah.* Dr Kennicot adds, that some Hebrew copies having the larger chronology were extant till the time of Eusebius, and some till the year 700.

Septum. SEPTUM, in anatomy, an enclosure or partition; a term applied to several parts of the body, which serve to separate one part from another; as, *septum narium*, or partition between the nostrils, &c.

SEPULCHRAL, something belonging to sepulchres or tombs: thus a sepulchral column is a column erected over a tomb, with an inscription on its shaft; and sepulchral lamps, those said to have been found burning in the tombs of several martyrs and others. See Lamp.

SEPULCHRE, a tomb or place destined for the interment of the dead. This term is chiefly used in speaking of the burying-places of the ancients, those of the moderns being usually called *tombs*.

Sepulchres were held sacred and inviolable; and the care taken of them has always been held a religious duty, grounded on the fear of God, and the belief of the soul's immortality. Those who have searched or violated them have been thought odious by all nations, and were always severely punished.

The Egyptians called sepulchres *eternal houses*, in contradistinction to their ordinary houses or palaces, which they called *inns*, on account of their short stay in the one in comparison of their long abode in the other. See Tomb.

Regular Canons of St Sepulchre, a religious order, formerly instituted at Jerusalem, in honour of the holy sepulchre, or the tomb of Jesus Christ.

Many of these canons were brought from the Holy Land into Europe, particularly into France, by Louis the Younger; into Poland, by Jaxa, a Polish gentleman; and into Flanders, by the counts thereof; many also came into England. This order was, however, suppressed by Pope Innocent VIII. who gave its revenues and effects to that of our lady of Bethlehem: which also becoming extinct, they were bestowed on the knights of St John of Jerusalem. But the suppression did not take effect in Poland, where they still subsist, as also in several provinces of Germany. These canons follow the rule of St Augustine.

Knights of the Holy Sepulchre, a military order, established in Palestine about the year 1114.

The knights of this order in Flanders chose Philip II. king of Spain, for their master, in 1558, and afterwards his son; but the grand-master of the order of Malta prevailed on the last to resign; and when afterwards the duke of Nevers assumed the same quality in France, the same grand-master, by his interest and credit, procured a like renunciation of him, and a confirmation of the union of this order to that of Malta.

SEQUANI, a people anciently forming a part of Gallia Celtica, but annexed to Belgica by Augustus, separated from the Helvetii by Mount Jura, with the Rhine on the east (Strabo), bordering on the Ædui, and Segustiano to the south, and Lingones to the west (Tacitus). Now Franche Comte.

SEQUESTRATION, in common law, is setting aside the thing in controversy from the possession of both the parties that contend for it. In which sense it is either voluntary, as when done by the consent of the parties; or necessary, as where it is done by the judge,

judge, of his own authority, whether the parties will or not.

Sequestration, in the civil law, is the act of the ordinary, disposing of the goods and chattels of one deceased, whose estate no man will meddle with.

A widow is also said to sequester, when she disclaims having any thing to do with the estate of her deceased husband.

Among the Romanists, in questions of marriage, where the wife complains of impotency in the husband, she is to be sequestered into a convent, or into the hands of matrons, till the process be determined.

Sequestration is also used for the act of gathering the fruits of a benefice void, to the use of the next incumbent.

Sometimes a benefice is kept under sequestration for many years, when it is of so small value, that no clergyman fit to serve the cure will be at the charge of taking it by institution; in which case the sequestration is committed either to the curate alone, or to the curate and church-wardens jointly. Sometimes the profits of a living in controversy, either by the consent of the parties, or the judge's authority, are sequestered and placed for safety in a third hand, till the suit is determined, a minister being appointed by the judge to serve the cure, and allowed a certain salary out of the profits. Sometimes the profits of a living are sequestered for neglect of duty, for dilapidations, or for satisfying the debts of the incumbent.

Sequestration, in chancery, is a commission usually directed to seven persons therein named, empowering them to seize the defendant's personal estate, and the profits of his real, and to detain them, subject to the order of the court. It issues on the return of the serjeant at arms, wherein it is certified, that the defendant had secreted himself.

Sequestrations were first introduced by Sir Nicholas Bacon, lord keeper in the reign of Queen Elizabeth; before which the court found some difficulty in enforcing its process and decrees; and they do not seem to be in the nature of process to bring in the defendant, but only intended to enforce the performance of the court's decree.

A sequestration is also made, in London, upon an action of debt; the course of proceeding in such case is this: The action being entered, the officer goes to the defendant's shop or warehouse, when no person is there, and takes a padlock, and hangs it on the door, uttering these words: "I do sequester this warehouse, and the goods and merchandise therein, of the defendant in this action, to the use of the plaintiff," &c. after which he sets on his seal, and makes a return of the sequestration in the compter; and four days being passed after the return made, the plaintiff may, at the next court, have judgment to open the shop or warehouse, and to have the goods appraised by two freemen, who are to be sworn at the next court held for that compter; and then the serjeant puts his hand to the bill of appraisement, and the court grants judgment thereon; but yet the defendant may put in bail before satisfaction, and by that means dissolve the sequestration; and after satisfaction, may put in bail to disprove the debt, &c.

In the time of the civil wars, sequestration was used for a seizing of the estates of delinquents for the use of the commonwealth.

Sequestration, in Scots law. See Law, p. 683.

SEQUIN, a gold coin, struck at Venice, and in several parts of the Grand Signior's dominions. In Turkey it is called *dahab*, or piece of gold, and according to Volney is in value about 6s. 3d. sterling. It varies, however, considerably in its value in different countries. At Venice it is equal to about 9s. 2d. sterling.

The Venetian sequins are in great request in Syria, from the fineness of their standard, and the practice they have of employing them for women's trinkets. The fashion of these trinkets does not require much art; the piece of gold is simply pierced, in order to suspend it by a chain, likewise of gold, which flows upon the breast. The more sequins that are attached to this chain, and the greater the number of these chains, the more is a woman thought to be ornamented. This is the favourite luxury, and the emulation of all ranks. Even the female peasants, for want of gold, wear piastres or smaller pieces; but the women of a certain rank disdain silver; they will accept of nothing but sequins of Venice, or large Spanish pieces, and crusadoes. Some of them wear 200 or 300, as well lying flat, as strung one on another, and hung near the forehead, at the edge of the head dress. It is a real load: but they do not think they can pay too dearly for the satisfaction of exhibiting this treasure at the public bath, before a crowd of rivals, to awaken whose jealousy constitutes their chief pleasure. The effect of this luxury on commerce, is the withdrawing considerable sums from circulation, which remain dead; besides, that when any of these pieces return into common use, having lost their weight by being pierced, it becomes necessary to weigh them. The practice of weighing money is general in Syria, Egypt, and all Turkey. No piece, however effaced, is refused there; the merchant draws out his scales and weighs it, as in the days of Abraham, when he purchased his sepulchre. In considerable payments, an agent of exchange is sent for, who counts paras by thousands, rejects a great many pieces of false money, and weighs all the sequins, either separately or together.

SERAGLIO, formed from the Persian word *seraw*, or Turkish word *sarai*, which signifies a house, and is commonly used to express the house or palace of a prince. In this sense it is frequently used at Constantinople; the houses of foreign ambassadors are called *seraglios*. But it is commonly used by way of eminence for the palace of the grand signior at Constantinople, where he keeps his court, and where his concubines are lodged, and where the youth are trained up for the chief posts of the empire.

It is a triangle about three Italian miles round, wholly within the city, at the end of the promontory Chrysoceras, now called the *Seraglio Point*. The buildings run back to the top of the hill, and from thence are gardens that reach to the edge of the sea. It is enclosed with a very high and strong wall, upon which there are several watch towers: and it has many gates, some of which open towards the sea-side, and the rest into the city; but the chief gate is one of the latter, which is constantly guarded by a company of capoochees, or porters; and in the night it is well guarded towards the

Seraglio. the sea. The outward appearance is not very beautiful, the architecture being irregular, consisting of separate edifices in the form of pavilions and domes.

The ladies of the seraglio are a collection of beautiful young women, chiefly sent as presents from the provinces and the Greek islands, most of them the children of Christian parents. The brave prince Heraclius hath for some years past abolished the infamous tribute of children of both sexes, which Georgia formerly paid every year to the Porte. The number of women in the harem depends on the taste of the reigning monarch or sultan. Selim had 2000, Achmet had but 300, and the late sultan had nearly 1600. On their admission they are committed to the care of old ladies, taught sewing and embroidery, music, dancing, and other accomplishments, and furnished with the richest clothes and ornaments. They all sleep in separate beds, and between every fifth there is a preceptress. Their chief governess is called *Katon Kiaga*, or governess of the noble young ladies. There is not one servant among them, for they are obliged to wait on one another by rotation; the last that is entered serves her who preceded her and herself. These ladies are scarcely ever suffered to go abroad, except when the grand signior removes from one place to another, when a troop of black eunuchs conveys them to the boats, which are enclosed with lattices and linen curtains; and when they go by land they are put into close chariots, and signals are made at certain distances, to give notice that none approach the roads through which they march. The boats of the harem, which carry the grand signior's wives, are manned with 24 rowers, and have white covered tilts, shut alternately by Venetian blinds. Among the emperor's attendants are a number of mutes, who act and converse by signs with great quickness, and some dwarfs, who are exhibited for the diversion of his majesty.

When he permits the women to walk in the gardens of the seraglio, all people are ordered to retire, and on every side there is a guard of black eunuchs, with sabres in their hands, while others go their rounds in order to hinder any person from seeing them. If, unfortunately, any one is found in the garden, even thro' ignorance or inadvertance, he is undoubtedly killed, and his head brought to the feet of the grand signior, who gives a great reward to the guard for their vigilance. Sometimes the grand signior passes into the gardens to amuse himself when the women are there; and it is then that they make use of their utmost efforts, by dancing, singing, seducing gestures, and amorous blandishments, to ensnare the affections of the monarch. It is not permitted that the monarch should take a virgin to his bed, except during the solemn festivals, and on occasion of some extraordinary rejoicings, or the arrival of some good news. Upon such occasions, if the sultan chooses a new companion to his bed, he enters into the apartment of the women, who are ranged in files by the governesses, to whom he speaks, and intimates the person he likes best: the ceremony of the handkerchief, which the grand signior is said to throw the girl that he elects, is an idle tale, without any foundation. As soon as the grand signior has chosen the girl that he has destined to be the partner of his bed, all the others follow her to the bath, washing and perfuming her, and dressing her superbly, conducting her singing, dancing, and rejoicing, to the bedchamber of the grand signior, who is generally, on such an occasion, already in bed. Scarcely has the new elected favourite entered the chamber, introduced by the grand eunuch who is upon guard, than she kneels down, and when the sultan calls her, she creeps into bed to him at the foot of the bed, if the sultan does not order her, by especial grace, to approach by the side: after a certain time, upon a signal given by the sultan, the governess of the girls, with all her suite, enter the apartment, and take her back again, conducting her with the same ceremony to the women's apartments; and if by good fortune she becomes pregnant, and is delivered of a boy, she is called *asaki sultanesse*, that is to say, sultaness-mother; for the first son she has the honour to be crowned, and she has the liberty of forming her court. Eunuchs are also assigned for her guard, and for her particular service. No other ladies, though delivered of boys, are either crowned or maintained with such costly distinction as the first; however, they have their service apart, and handsome appointments. After the death of the sultan, the mothers of the male children are shut up in the old seraglio, from whence they can never come out any more, unless any of their sons ascend the throne. Baron de Tott informs us, that the female slave who becomes the mother of a sultan, and lives long enough to see her son mount the throne, is the only woman who at that period alone acquires the distinction of *sultana-mother*; she is till then in the interior of her prison with her son. The title of *bache kadun*, principal woman, is the first dignity of the grand signior's harem; and she hath a larger allowance than those who have the title of second, third, and fouth woman, which are the four free women the Koran allows.

This is a description of the grand signior's seraglio: we shall now add an account of the seraglio or *harem*, as it is often called, of the emperor of Morocco, from the very interesting tour of Mr Lempriere. This gentleman being a surgeon by profession, was admitted into the harem to prescribe for some of the ladies who were indisposed, and was therefore enabled to give a particular account of this female prison, and, what is still more curious, of the manners and behaviour of its inhabitants.

The harem forms a part of the palace. The apartments, which are all on the ground floor, are square, very lofty, and four of them enclose a spacious square court, into which they open by means of large folding doors. In the centre of these courts, which are floored with blue and white chequered tiling, is a fountain, supplied by pipes from a large reservoir on the outside of the palace, which serves for the frequent ablutions recommended by the Mahometan religion, as well as for other purposes. The whole of the harem consists of about twelve of these square courts, communicating with each other by narrow passages, which afford a free access from one part of it to another, and of which all the women are allowed to avail themselves.

The apartments are ornamented on the outside with beautiful carved wood. In the inside most of the rooms are hung with rich damask of various colours; the floors are covered with beautiful carpets, and there are mattresses disposed at different distances, for the purposes of sitting and sleeping.

Besides

Seraglio.

Besides these, the apartments are furnished at each extremity with an elegant European mahogany bedstead, hung with damask, having on it several mattresses placed one over the other, which are covered with various coloured silks; but these beds are merely placed there to ornament the room. In all the apartments, without exception, the ceiling is wood, carved and painted. The principal ornaments in some were large and valuable looking glasses, hung on different parts of the walls. In others, clocks and watches of different sizes, in glass cases, were disposed in the same manner.

The sultana Lalla Batoom and another favourite were indulged with a whole square to themselves; but the concubines were only each allowed a single room.

Each female had a separate daily allowance from the emperor, proportioned to the estimation in which they were held by him. The late emperor's allowance was very trifling; Lalla Duuyaw, the favourite sultana, had very little more than half a crown English a-day, and the others less in proportion. It must be allowed, that the emperor made them occasional presents of money, dress, and trinkets; but this could never be sufficient to support the number of domestics and other expences they must incur. Their greatest dependence therefore was on the presents they received from those Europeans and Moors who visited the court, and who employed their influence in obtaining some particular favour from the emperor. This was the most successful mode that could be adopted. When Mr Lempriere was at Morocco, a Jew, desirous of obtaining a very advantageous favour from the emperor, for which he had been a long time unsuccessfully soliciting, sent to all the principal ladies of the harem presents of pearls to a very large amount; the consequence was, that they all went in a body to the emperor, and immediately obtained the wished-for concession.

The ladies separately furnish their own rooms, hire their own domestics, and, in fact, do what they please in the harem, but are not permitted to go out without an express order from the emperor, who very seldom grants them that favour, except when they are to be removed from one palace to another. In that case, a party of soldiers is despatched a little distance before them, to disperse the male passengers in particular, and to prevent the possibility of their being seen. This previous step being taken, a piece of linen cloth is tied round the lower part of the face, and afterwards these miserable females cover themselves entirely with their haicks, and either mount mules, which they ride like men, or, what is more usual, are put into a square carriage or litter, constructed for this purpose, which by its lattice work allows them to see without being seen. In this manner they set off, under the charge of a guard of black eunuchs. This journey, and sometimes a walk within the bounds of the palace, with which they are, however, seldom indulged, is the only exercise they are permitted to take.

The late emperor's harem consisted of between 60 and 100 females, besides their domestics and slaves, which were very numerous. Many of the concubines were Moorish women, who had been presented to the emperor, as the Moors consider it an honour to have their daughters in the harem; several were European slaves, who had either been made captives, or purchased by the emperor; and some were negroes.

In this group the Europeans, or their descendants had by far the greatest claim to the character of handsome. There was one in particular, who was a native of Spain, and taken into the harem at about the same age as Lalla Douyaw, who was indeed a perfect beauty. Nor was this lady quite singular in that respect, for many others were almost equally handsome.

The eunuchs, who have the entire charge of the women, and who in fact live always among them, are the children of negro slaves. They are generally either very short and fat, or else tall, deformed, and lame. Their voices have that particular tone which is observable in youths who are just arriving at manhood; and their persons altogether afford a disgusting image of weakness and effeminacy.

The same gentleman gives us a very curious account of the manners and ignorance of these immured females, from his own observation when visiting the prince's harem. "Attended by an eunuch (says he), after passing the gate of the harem, which is always locked, and under the care of a guard of eunuchs, we entered a narrow and dark passage, which soon brought us to the court, into which the women's chambers open. We here saw numbers of both black and white women and children; some concubines, some slaves, and other hired domestics.

"Upon their observing the unusual figure of an European, the whole multitude in a body surrounded me, and expressed the utmost astonishment at my dress and appearance. Some stood motionless, with their hands lifted up, their eyes fixed, and their mouths open, in the usual attitude of wonder and surprise. Some burst into immoderate fits of laughter; while others again came up, and with uncommon attention eyed me from head to foot. The parts of my dress which seemed most to attract their notice were my buckles, buttons, and stockings; for neither men nor women in this country wear any thing of the kind. With respect to the club of my hair, they seemed utterly at a loss in what view to consider it; but the powder which I wore they conceived to be employed for the purpose of destroying vermine. Most of the children, when they saw me, ran away in the most perfect consternation; and on the whole, I appeared as singular an animal, and I dare say had the honour of exciting as much curiosity and attention, as a lion or a man tiger just imported from abroad, and introduced into a country town in England on a market day. Every time I visited the harem, I was surrounded and laughed at by this curious mob, who, on my entering the gate, followed me close to the very chamber to which I was proceeding, and on my return universally escorted me out.

"The greatest part of the women were uncommonly fat and unwieldy; had black and full eyes, round faces, with small noses. They were of different complexions; some very fair, some sallow, and others again perfect negroes.

"One of my new patients being ready to receive me, I was desired to walk into her room; where, to my great surprise, I saw nothing but a curtain drawn quite across the apartment, similar to that of a theatre which separates the stage from the audience. A female domestic brought a very low stool, placed it near the curtain, and told me I was to sit down there, and feel her mistress's pulse.

"The lady, who had by this time fummoned up courage to fpeak, introduced her hand from the bottom of the curtain, and defired me to inform her of all her complaints, which fhe conceived I might perfectly do by merely feeling the pulfe. It was in vain to afk her where her pain was feated, whether in her ftomach, head, or back; the only anfwer I could procure was a requeft to feel the pulfe of the other hand, and then point out the feat of the difeafe, and the nature of the pain.

"Having neither fatisfied my curiofity by exhibiting her face, nor made me acquainted with the nature of her complaint, I was under the neceffity of informing her in pofitive terms, that to underftand the difeafe, it was abfolutely neceffary to fee the tongue as well as to feel the pulfe; and that without it I could do nothing for her. My eloquence, or rather that of my Jewifh interpreter, was, however, for a long time exerted in vain; and I am perfuaded fhe would have difmiffed me without any further inquiry, had not her invention fupplied her with a happy expedient to remove her embarraffment. She contrived at laft to cut a hole through the curtain, through which fhe extruded her tongue, and thus complied with my injunction as far as it was neceffary in a medical view, but moft effectually difappointed my curiofity.

"I was afterwards ordered to look at another of the prince's wives, who was affected with a fcrophulous fwelling in her neck. This lady was, in the fame manner as the other, at firft excluded from my fight; but as fhe was obliged to fhow me her complaint, I had an opportunity of feeing her face, and obferved it to be very handfome."

It is curious to obferve the ftrange and childifh notions of perfons who have been totally fecluded from the world. All the ladies of the harem expected that our author fhould have inftantly difcovered their complaints upon feeling the pulfe, and that he could cure every difeafe inftantaneoufly. He found them proud and vain of their perfons, and extremely ignorant. "Among many ridiculous queftions, they afked my interpreter (fays M. Lempriere) if I could read and write: upon being anfwered in the affirmative, they expreffed the utmoft furprife and admiration at the abilities of the Chriftians. There was not one among them who could do either; thefe rudiments of learning are indeed only the lot of a few of their men, who on that account are named *Talbs*, or explainers of the Mahometan law."

It is melancholy to reflect on the fituation of thefe unfortunate women. Being confidered as the mere inftruments of pleafure, no attention is paid to the improvement of their minds. They have no employment to occupy their time. Their needle work is performed by Jeweffes; their food is dreffed, and their chambers taken care of by flaves and domeftics. They have no amufement but a rude and barbarous kind of melancholy mufic, without melody, variety, or tafte; and converfation with one another, which muft indeed be very confined, uniform, and inanimate, as they never fee a new object. Excluded from the enjoyment of frefh air and exercife, fo neceffary for the fupport of health and life; deprived of all fociety but that of their fellow fufferers, a fociety to which moft of them would prefer folitude itfelf; they are only to be confidered as the moft abject of flaves—flaves to the vices and caprice of a licentious tyrant, who exacts even from his wives themfelves a degree of fubmiffion and refpect which borders upon idolatry, and which God and nature never meant fhould be paid to a mortal.

SERAI, a building on the high road, or in large cities in India, erected for the accommodation of travellers.

SERAPH, or SERAPHIM, a fpirit of the higheft rank in the hierarchy of angels; who are thus called from their being fuppofed to be moft inflamed with divine love, by their nearer and more immediate attendance at the throne of God, and to communicate their fervour to the remoter and inferior orders. See ANGEL.

SERAPHIC, burning or inflamed with love or zeal, like a feraphim: thus St Bonaventure is called the *feraphic doctor*, from his abundant zeal and fervour.

SERAPIAS, in botany: A genus of plants belonging to the order of diandria, and to the clafs of gynandria; and in the natural fyftem arranged under the 7th order, *Orchideæ*. The nectarium is egg-fhaped and gibbous, with an egg-fhaped lip. The fpecies, according to Linnæus, are ten. 1. Latifolia; 2. Longifolia; 3. Grandiflora, or enfifolia; 4. Lancifolia; 5. Rubra; 6. Lingua; 7. Cordigera; 8. Capenfis; 9. Erecta; 10. Falcata. The three firft are natives of Britain. 1. The *Latifolia*, or broad-leaved helleborine, is diftinguifhed by fibrous bulbs, by ovate ftem-clafping leaves, and pendulous flowers. The ftalk is erect, about a cubit high, and furnifhed with fix or eight nervous oval leaves; the fpike is about fix inches long; the three upper petals are of a green colour, and of an oval acute form; the lateral ones are a little fhorter, and of a white colour, with a little tinge of green. 2. The *Paluftris*, or marfh helleborine, grows in rough boggy paftures and marfhes, and flowers in July. It is diftinguifhed by fibrous bulbs, fword-fhaped feffile leaves, pendulous flowers; and the lip of the nectarium is obtufe, fomewhat ferrated, and longer than the petals. The flowers grow to the number of 15 or 20 in a loofe fpike. The three exterior petals are green mixed with red; the lateral ones are white with a red blufh; and the nectarium is marked with red lines and yellow tuberculous fpots. 3. The *Grandiflora*, or white-flowered helleborine, grows in woods, and flowers in June. Its characteriftics are, fibrous bulbs, fword-fhaped leaves, erect flowers; and the lip of the nectarium is obtufe and fhorter than the petals. The flowers are large and erect, and confifting of fix or eight in a thin fpike; the petals are all white, and connive together; the lip of the nectarium is enclofed within the petals, is white and ftreaked with three yellow prominent lines.

SERAPION, a phyfician of Alexandria. He and Philinus of the ifle of Cos were both fcholars of Herophilus, and were founders of the empiric fect; which happened about 287 B. C.

SERAPIS, in mythology, an Egyptian deity, who was worfhipped under various names and attributes, as the tutelary god of Egypt in general, and as the patron of feveral of their principal cities. Tacitus informs us, that he was worfhipped as a kind of univerfal deity that reprefented Efculapius, Ofiris, Jupiter, and Pluto; and he was fometimes taken for Jupiter Ammon, the Sun, and Neptune; and the honours that were rendered to him

Serapis ‖ Serene.

him at Alexandria were more solemn and extraordinary than those of any other place.

Plutarch and Clemens of Alexandria, as well as Tacitus *, inform us, that while the first Ptolemy was employed in fortifying Alexandria with walls, adorning it with temples and stately buildings, there appeared to him in his sleep a young man of extraordinary beauty, of a stature more than human, admonishing him to despatch into Pontus some of his most trusty friends to bring from thence his statue: he assured him, that the city and kingdom which possessed it should prove happy, glorious, and powerful. The young man having thus spoke, disappeared, mounting up into heaven in a blaze.

* Tac. Hist. l. iv. cap. 3. Plut. de Iside et Osiride Clem. Alex. in Prot sp.

Ptolemy discovered his vision to the priests; but finding them ignorant of Pontus, he had recourse to an Athenian, who informed him that near Sinope, a city of Pontus, there was a temple much resorted to by the natives, which was consecrated to Pluto, where he had a statue, near which stood that of a woman. Ptolemy, neglecting the injunctions of the apparition, it again appeared to him in a menacing attitude; and the king immediately despatched ambassadors to the Serapian monarch, loaded with presents. The king of Sinope consented; but his subjects opposed the removal of the statue. The god, however, of his own accord, as we are informed, conveyed himself to the ambassador's ship, and in three days landed in Alexandria. The statue of Serapis was erected in one of the suburbs of the city, where a magnificent temple was afterwards reared.

The statue of Serapis, according to Macrobius, was of a human form, with a basket or bushel on his head, signifying plenty; his right hand leaned on the head of a serpent, whose body was wound round a figure with three heads, of a dog, a lion, and a wolf; in his left hand he held a measure of a cubit length, as it were to take the height of the waters of the Nile. The figure of Serapis is found on many ancient medals.

The famous temple of Serapis at Alexandria was destroyed by order of Theodosius; and the celebrated statue of this deity was broken in pieces, and its limbs carried first in triumph by the Christians through the city, and then thrown into a fierce fire, kindled for that purpose in the amphitheatre. As the Egyptians ascribed the overflowing of the Nile, to which was owing the fertility of their country, to the benign influence of their god Serapis, they concluded, that now he was destroyed, the river would no longer overflow, and that a general famine would ensue; but when they observed, on the contrary, that the Nile swelled to a greater height than had been known in the memory of man, and thereby produced an immense plenty of all kinds of provisions, many of the Pagans, renouncing the worship of idols, adored the God of the Christians.

SERENA GUTTA, the same as *amaurosis*. See MEDICINE, N° 360.

SERENADE, a kind of concert given in the night by a lover to his mistress, under her window. These sometimes only consist of instrumental music, but at other times voices are added: the music and songs composed for these occasions are also called *serenades*.

SERENE, a title of honour given to several princes and to the principal magistrates of republics. The king of Britain, the republic and doge of Venice, and the children of the king of Spain, are called *most serene*; and when the pope or the sacred college write to the emperor, to kings, or to the doge, they give them no other title. In like manner, the emperor gives no other title to any king, except to the king of France.

Serenus ‖ Serge.

SERENUS (Sammonicus), a celebrated physician in the reigns of the emperors Severus and Caracalla, in and about the year 200. He wrote several treatises on history and the works of nature; but there is only one of them extant, which is a very indifferent poem on the Remedies of Diseases. He was murdered at a festival by the order of Caracalla. He had a library that contained 62,000 volumes, which Quintus Serenus Sammonicus his son gave to Gordian the Younger, to whom he was preceptor.

SERES (Ptolemy), a people of the Farther Asia; bounded on the west by Scythia extra Imaum; on the north and east, by Terra Incognita; and on the south, by India extra Gangem. According to these limits, their country answers nearly to Cathay or North China. Other authors vary greatly in placing them, though the generality agree in placing them far to the east. Mela places them between the Indi and Scythae; and perhaps beyond the Indi, if we distinguish the Sinae from them. The ancients commend them for their cotton manufactures, different from the produce of the bombyces or silk worms, called *seres* by the Greeks; whence *serica* "silk."

SERGE, a woollen quilted stuff, manufactured on a loom with four treddles, after the manner of rateens, and other stuffs that have the whale. The goodness of serges is known by the quilting, as that of cloths by the spinning. Of serges there are various kinds, denominated either from the different qualities thereof, or from the places where they are wrought. The most considerable is the London serge, now highly valued abroad, particularly in France, where a manufacture is carried on with considerable success, under the title of *serge façon de Londres*.

The method of making the London serge we shall now describe: For wool, the longest is chosen for the warp, and the shortest for the woof. Before either kind is used, it is first scoured, by putting it in a copper of liquor, somewhat more than lukewarm, composed of three parts of fair water and one of urine. After having stayed long enough therein for the liquor to dissolve, and take off the grease, &c. it is stirred briskly about with a wooden peel; taken out of the liquor, drained, and washed in a running water, dried in the shade, beaten with sticks on a wooden rack to drive out the coarser dust and filth, and then picked clean with the hands. Thus far prepared, it is greased with oil of olives, and the longest part, destined for the warp, is combed with large combs, heated in a little furnace for the purpose. To clear off the oil again, the wool is put in a liquor composed of hot water, with soap melted therein; whence being taken out, wrung, and dried, it is spun on the wheel.

As to the shorter wool, intended for the woof, it is only carded on the knee with small cards, and then spun on the wheel, without being scoured of its oil. It must be remarked, that the thread for the warp is always to be spun much finer, and better twisted, than that of the woof. The wool both for the warp and the woof being spun, and the thread divided into skains, that of the woof is put on spools (unless it have been spun

Serge, Ser. cont.

spun upon them) fit for the cavity or eye of the shuttle, and that for the warp is wound on a kind of wooden bobbins to fit it for warping. When warped, it is stiffened with a kind of size, whereof that made of the shreds of parchment is held the best; and when dry is put on the loom.

When mounted on the loom, the workmen raising and lowering the threads (which are passed through a reed), by means of four treddles placed underneath the loom, which he makes to act transversely, equally, and alternately, one after another, with his feet, in proportion as the threads are raised and lowered, throws the shuttle across from one side to the other; and each time that the shuttle is thrown, and the thread of the woof is crossed between those of the warp, strikes it with the frame to which the reed is fastened, through those teeth the threads of the warp pass; and this stroke he repeats twice or thrice, or even more, till he judges the crossing of the serge sufficiently close: thus he proceeds till the warp is all filled with woof.

The serge now taken off the loom is carried to the fuller, who scours it in the trough of his mill with a kind of fat earth, called *fuller's earth*, first purged of all stones and filth. After three or four hours scouring, the fuller's earth is washed out in fair water, brought by little and little into the trough, out of which it is taken when all the earth is cleared; then with a kind of iron pincers or plyers, they pull off all the knots, ends, straws, &c. sticking out on the surface on either side; and then returning it into the fulling trough, where it is worked with water somewhat more than lukewarm, with soap dissolved therein for near two hours; it is then washed out till such time as the water becomes quite clear, and there be no signs of soap left; then it is taken out of the trough, the knots, &c. again pulled off, and then put on the tenter to dry, taking care as fast as it dries to stretch it out both in length and breadth till it be brought to its just dimensions. When well dried, it is taken off the tenter, and dyed, shorn, and pressed.

SERGEANT, or SERJEANT, *at Law* or *of the Coif*, is the highest degree taken at the common law, as that of Doctor is of the civil law; and as these are supposed to be the most learned and experienced in the practice of the courts, there is one court appointed for them to plead in by themselves, which is the common pleas, where the common law of England is most strictly observed: but they are not restricted from pleading in any other court, where the judges, who cannot have that honour till they have taken the degree of serjeant at law, call them *brothers*.

SERGEANT at Arms, or *Mace*, an officer appointed to attend the person of the king; to arrest traitors, and such persons of quality as offend; and to attend the lord high steward, when sitting in judgment on a traitor.

Of these, by statute 13 Rich. II. cap. 6. there are not to be above 30 in the realm. There are now nine at court at 100l. *per annum* salary each; they are called the *king's sergeants at arms*, to distinguish them from others: they are created with great ceremony, the person kneeling before the king, his majesty lays the mace on his right shoulder, and says, *Rise up, sergeant at arms, and esquire for ever*. They have besides, a patent for the office, which they hold for life.

They have their attendance in the presence chamber where the band of gentlemen pensioners wait; and receiving the king at the door, they carry the maces before him to the chapel door, whilst the band of pensioners stand foremost, and make a lane for the king, as they also do when the king goes to the house of lords.

Serge || Seri

There are four other sergeants at arms, created in the same manner; one who attends the lord chancellor; a second, the lord treasurer; a third, the speaker of the house of commons; and a fourth, the lord mayor of London on solemn occasions.

They have a considerable share of the fees of honour, and travelling charges allowed them when in waiting, viz. five shillings *per* day when the court is within ten miles of London, and ten shillings when twenty miles from London. The places are in the lord chamberlain's gift.

There are also sergeants of the mace of an inferior kind, who attend the mayor or other head officer of a corporation.

Common SERGEANT, an officer in the city of London, who attends the lord mayor and court of aldermen on court days, and is in council with them on all occasions, within and without the precincts or liberties of the city. He is to take care of orphans estates, either by taking account of them, or to sign their indentures, before their passing the lord mayor and court of aldermen: and he was likewise to let and manage the orphans estates, according to his judgment to their best advantage. See RECORDER.

SERGEANT, in war, is a noncommissioned officer in a company of foot or troop of dragoons, armed with a halbert, and appointed to see discipline observed, to teach the soldiers the exercise of their arms, to order, straighten, and form their ranks, files, &c. He receives the orders from the adjutant, which he communicates to his officers. Each company generally has two sergeants.

SERGEANTY (*Serjeantia*), signifies, in law, a service that cannot be due by a tenant to any lord but the king; and this is either *grand sergeanty*, or *petit*. The first is a tenure by which the one holds his lands of the king by such services as he ought to do in person to the king at his coronation; and may also concern matters military, or services of honour in peace: as to be the king's butler, carver, &c. *Petit sergeanty* is where a man holds lands of the king to furnish him yearly with some small thing towards his wars; and in effect payable as rent. Though all tenures are turned into *soccage* by the 12 Car. II. cap. 24, yet the honorary services of grand sergeanty still remain, being therein excepted. See *KNIGHT-Service*.

SERIES, in general, denotes a continual succession of things in the same order, and having the same relation or connexion with each other: in this sense we say, a series of emperors, kings, bishops, &c.

In natural history, a series is used for an order or subdivision of some class of natural bodies; comprehending all such as are distinguished from the other bodies of that class, by certain characters which they possess in common, and which the rest of the bodies of that cast have not.

1 Series.

SERIES, in arithmetic and algebra, a rank or number of terms in succession, increasing or diminishing in some certain ratio or proportion. There are several kinds of series; as *arithmetical*, *geometrical*, *infinite*, &c. The

2 Various kinds of.

The two first of these are, however, more generally known or distinguished by the names of *arithmetical* and *geometrical progression*. These serieses have already been explained and illustrated in the article ALGEBRA, particularly the two first: it therefore only remains, in this place, to add a little to what has already been done to the last of these: namely,

INFINITE SERIES,

3 Infinite series.

Is formed by dividing the numerator of a fraction by its denominator, that denominator being a compound quantity; or by extracting the root of a surd.

4 Converging and diverging series.

An infinite series is either *converging* or *diverging*. A converging series is that in which the magnitude of the several terms gradually diminishes; and a diverging series is that in which the successive terms increase in magnitude.

5 Law of an infinite series.

The *law* of an infinite series is the order in which the terms are observed to proceed. This law is often easily discovered from a few of the first terms of the series; and then the series may be continued as far as may be thought necessary, without any farther division or evolution.

An infinite series, as has already been observed, is obtained by division or evolution; but as that method is very tedious, various other methods have been proposed for performing the same in a more easy manner; as by assuming a series with unknown coefficients, by the binomial theorem, &c.

I. *Of the Method of Series by Division and Evolution.*

RULE.

6 Method of converting fractional quantity to an infinite series, by division.

Let the division or evolution of the given fraction, which is to be converted into an infinite series, be performed as in Chapters I. and IV. of our article ALGEBRA, and the required series will be obtained.

EXAMPLES.

1. Convert the fraction $\frac{1}{1-x}$ into an infinite series?

$$
\begin{array}{l}
1-x)\ 1 \quad (1+x+x^2+x^3+x^4, \text{ \&c.} \\
\underline{1-x} \\
x \\
\underline{x-x^2} \\
x^2 \\
\underline{x^2-x^3} \\
x^3 \\
\underline{x^3-x^4} \\
x^4 \\
\underline{x^4-x^5} \\
x^5
\end{array}
$$

Hence the fraction $\frac{1}{1-x}=1+x+x^2+x^3+x^4$, &c.

From inspection of the terms of this series, it appears that each term is formed by multiplying the preceding term by x; and hence it may be continued as far as may be thought necessary without continuing the division.

2. Let the fraction $\frac{ay}{1+x}$ be converted into an infinite series?

$$
\begin{array}{l}
1+x)\ ay \quad (ay-ayx+ayx^2-ayx^3+ayx^4, \text{ \&c.} \\
\quad \underline{ay+ayx} \\
\quad -ayx \\
\quad \underline{-ayx-ayx^2} \\
\qquad ayx^2 \\
\qquad \underline{ayx^2+ayx^3} \\
\qquad\quad -ayx^3 \\
\qquad\quad \underline{-ayx^3-axy^4} \\
\qquad\qquad ayx^4 \\
\qquad\qquad \underline{ayx^4+axy^5} \\
\qquad\qquad\quad -ayx^5
\end{array}
$$

Hence $\frac{ay}{1+x}=ay\times\overline{1-x+x^2-x^3+x^4}$ &c. and the law of the series is obvious.

3. Reduce the fraction $\frac{m^2+x^2}{m+x}$ into an infinite series?

$$
\begin{array}{l}
m+x)\ m^2+x^2\ (m-x+\frac{2x^2}{m}-\frac{2x^3}{m^2}+\frac{2x^4}{m^3}, \text{ \&c.} \\
\quad \underline{m^2+mx} \\
\quad -mx+x^2 \\
\quad \underline{-mx-x^2} \\
\qquad 2x^2 \\
\qquad \underline{2x^2+\frac{2x^3}{m}} \\
\qquad\quad -\frac{2x^3}{m} \\
\qquad\quad \underline{-\frac{2x^3}{m}-\frac{2x^4}{m^2}} \\
\qquad\qquad \frac{2x^4}{m^2}, \text{ \&c.}
\end{array}
$$

Hence $\frac{m^2+x^2}{m+x}=m-x+\frac{2x}{m}\times\frac{x}{1}-\frac{x^2}{m}+\frac{x^3}{m^2}$, &c. and the law of the series is evident.

4. Convert the quantity $\frac{a^2}{a^2+2ay+y^2}$ into an infinite series?

$$
\begin{array}{l}
a^2+2ay+y^2)\ a^2\ (1-\frac{2y}{a}+\frac{3y^2}{a^2}-\frac{4y^3}{a^3}, \text{ \&c.} \\
\quad \underline{a^2+2ay+y^2} \\
\quad -2ay-y^2 \\
\quad \underline{-2ay-4y^2-\frac{2y^3}{a}} \\
\qquad 3y^2+\frac{2y^3}{a} \\
\qquad \underline{3y^2+\frac{6y^3}{a}+\frac{3y^4}{a^2}} \\
\qquad\quad -\frac{4y^3}{a}-\frac{3y^4}{a^2}
\end{array}
$$

Whence

Series.

Whence $\frac{a^2}{a^2+2ay+y^2}=1-\frac{2y}{a}+\frac{3y^2}{a^2}-\frac{4y^3}{a^3}$, &c.; and each term is found by multiplying the preceding by $\frac{y}{a}$ and increasing the coefficient by unity.

7 And evolution.

5. Let $\sqrt{a^2+x^2}$ be converted into an infinite series?

$$a^2+x^2\,)\,a+\frac{x^2}{2a}-\frac{x^4}{8a^3}+\frac{x^6}{16a^5}-\frac{x^8}{128a^7}$$

$$a^2$$

$$2a+\frac{x^2}{2a}\,)\,x^2$$

$$x^2+\frac{x^4}{4a^2}$$

$$2a\frac{x^2}{a}-\frac{x^4}{8a^3}\,)\,-\frac{x^4}{4a^2}$$

$$-\frac{x^4}{4a^2}-\frac{x^6}{8a^4}+\frac{x^8}{64a^6}$$

$$2a+\frac{x^2}{a}-\frac{x^4}{4a^3}+\frac{x^6}{16a^5}\,)\,\frac{x^6}{8a^4}-\frac{x^8}{64a^6}$$

$$\frac{x^6}{8a^4}+\frac{x^8}{16a^6}-\frac{x^{10}}{64a^8}+\frac{x^{12}}{256a^{10}}$$

$$-\frac{5x^8}{64a^6}+\frac{x^{10}}{64a^8}-\frac{x^{12}}{256a^{10}}$$

Hence the square root of $a^2+x^2=a+\frac{x^2}{2a}-\frac{x^4}{8a^3}+\frac{x^6}{16a^5}-\frac{x^8}{128a^7}$, &c.

In continuing the operation, those terms may be neglected whose dimensions exceed those of the last term to which the root is to be continued.

II. *Of the Method of Series by assuming a Series with unknown Coefficients.*

8 By means of an assumed series.

Rule. Assume a series with unknown coefficients to represent that required. Let this series be multiplied or involved, according to the nature of the question; and the quantities of the same dimension being put equal to each other, the coefficients will be determined; and hence the required series will be known.

Examples. 1. Let $\frac{1}{a-x}$ be converted into an infinite series? Assume $\frac{1}{a-x}=A+Bx+Cx^2+Dx^3+Ex^4$, &c.

Then this assumed series, multiplied by $a-x$, gives

$$1=aA+aBx+aCx^2+aDx^3+aEx^4,\ \&c.$$
$$-Ax-Bx^2-Cx^3-Dx^4,\ \&c.$$

Now, by equating the coefficients of the same powers of x, we have $aA=1$, $aB-A=0$, $aC-B=0$, $aD-C=0$, $aE-D=0$, &c. Hence $A=\frac{1}{a}$, $B=\frac{A}{a}=\frac{1}{a^2}$, $C=\frac{B}{a}=\frac{1}{a^3}$, $D=\frac{C}{a}=\frac{1}{a^4}$, $E=\frac{D}{a}=\frac{1}{a^5}$, &c.; whence, by substitution, we have $\frac{1}{a-x}=\frac{1}{a}+\frac{x}{a^2}+\frac{x^2}{a^3}+\frac{x^3}{a^4}+\frac{x^4}{a^5}$, &c.

2. Convert the quantity $\frac{c^2}{c^2+2cy-y^2}$ into an infinite series?

Let the assumed series be $A+By+Cy^2+Dy^3$, &c. which multiplied by $c^2+2cy-y^2$, gives

$$c^2=c^2A+c^2By+c^2Cy^2+c^2Dy^3,\ \&c.$$
$$+2cAy+2cBy^2+2cCy^3$$
$$-Ay^2-By^3.$$

Now, by equating the coefficients of the homologous terms, we have $c^2=c^2A$, $c^2B+2cA=0$, $c^2C+2cB-A=0$, $c^2D+2cC-B=0$, &c.; whence $A=1$, $B=-\frac{2A}{c}=-\frac{2}{c}$, $C=\frac{A-2cB}{c^2}=\frac{1+4}{c^2}=\frac{5}{c^2}$, $D=\frac{B-2cC}{c^2}=\frac{-2-10}{c^3}=-\frac{12}{c^3}$, &c.; whence $\frac{c^2}{c^2+2cy-y^2}=1-\frac{2y}{c}+\frac{5y^2}{c^2}-\frac{12y^3}{c^3}$ &c.

3. Required the square root of a^2-x^2?

Let $\overline{a^2-x^2}|^{\frac{1}{2}}=A+Bx^2+Cx^4+Dx^6$, &c. which being squared gives

$$a^2-x^2=A^2+2ABx^2+B^2x^4+2ADx^6,\ \&c.$$
$$+2ACx^4+2BCx^6.$$

Hence $A^2=a^2$, $2AB+1=0$, $B^2+2AC=0$, $2AD+2BC=0$, &c. Then $A=a$, $B=-\frac{1}{2A}=-\frac{1}{2a}$, $C=-\frac{B^2}{2A}=\frac{1}{8a^3}$, $D=-\frac{BC}{A}=\frac{1}{16a^5}$, &c.; whence $\overline{a^2-x^2}|^{\frac{1}{2}}=a-\frac{x^2}{2a}-\frac{x^4}{8a^3}-\frac{x^6}{16a^5}$, &c.

III. *Of the Method of reducing a fractional Quantity into an Infinite Series by the Binomial Theorem.*

As this method has already been illustrated in the article Algebra, we shall therefore briefly state the theorem, and add a few examples.

Binomial Theorem.

$$\overline{a+b}|^{\frac{m}{n}}=a^{\frac{m}{n}}+\frac{m}{n}a^{\frac{m-n}{n}}b+\frac{m}{n}\times\frac{m-n}{2n}\times a^{\frac{m-2n}{n}}b^2+\frac{m}{n}\times\frac{m-n}{2n}\times\frac{m-2n}{3n}\times a^{\frac{m-3n}{n}}b^3,\ \&c.$$

$$\text{Or } a^{\frac{m}{n}}\times\overline{1+\frac{b}{a}}|^{\frac{m}{n}}=a^{\frac{m}{n}}\times\overline{1+\frac{m}{n}\times\frac{b}{a}+\frac{m}{n}\times\frac{m-n}{2n}\times\frac{b^2}{a^2}+\frac{m}{n}\times\frac{m-n}{2n}\times\frac{m-2n}{3n}\times\frac{b^3}{a^3}},\ \&c.$$

Examples.

1. Let $\frac{a}{\overline{ax-x^2}|^{\frac{1}{2}}}$ be converted into an infinite series? Now $\frac{a}{\overline{ax-x^2}|^{\frac{1}{2}}}=a\times\overline{ax-x^2}|^{-\frac{1}{2}}=\frac{a}{ax|^{\frac{1}{2}}}\times\overline{1-\frac{x}{a}}|^{-\frac{1}{2}}=\frac{a}{x}|^{\frac{1}{2}}\times\overline{1-\frac{x}{a}}|^{-\frac{1}{2}}$. And this last expression, being compared with the general theorem, gives $\frac{b}{a}=\frac{x}{a}$, $m=-1$, $n=2$. Hence by substitution, we have $\frac{a}{\overline{ax-x^2}|^{\frac{1}{2}}}$, $=\frac{a}{x}|^{\frac{1}{2}}\times\overline{1-\frac{1}{2}\times\frac{x}{a}-\frac{1}{2}\times\frac{-1-2}{4}\times\frac{x^2}{a^2}-\frac{1}{2}\times}$

Series.

$\overline{\frac{-1-2}{4}} \times \overline{\frac{-1-4}{6}} \times \frac{x^3}{a^3}$, &c. $= \frac{a}{x}\Big|^{\frac{1}{2}} + 1 + \frac{x}{2a} + \frac{3x^2}{8a^2} + \frac{5x^3}{16a^3} + \frac{35x^4}{128a^4}$, &c.

2. Required the square root of $a^2 + x^2$?

By comparing this with the general theorem, we have $a = a,^2\ b = x^2$, $m = 1$, $n = 2$. Hence, by substitution, the series becomes $a \times \overline{1 + \frac{1}{2} \times \frac{x^2}{a^2} + \frac{1}{2} \times \frac{1-2}{2 \times 2} \times \frac{x^4}{a^4} + \frac{1}{2} \times \frac{1-2}{2 \times 2} \times \frac{1-4}{3 \times 2} \times \frac{x^6}{a^6}}$, &c. $= a \times \overline{1 + \frac{x^2}{2a} - \frac{x^4}{8a^4} + \frac{x^6}{16a^6} - \frac{5x^8}{128a^8}}$, &c. And $\overline{a^2 - b^2}\big|^{\frac{1}{2}} = a \times \overline{1 - \frac{x^2}{2a} - \frac{x^4}{8a^4} - \frac{x^6}{16a^6} - \frac{5x^8}{128a^8}}$, &c.

In order to apply this to numbers, let the square root of 85 be required? Now, the square root of 85 $= \sqrt{81 + 4}$; hence $a = 9$, and $x^2 = 4$.

Then $1 \quad = \quad 1.000000$

$\frac{x^2}{2a^2} = \frac{4}{2 \times 81} = 0.024691$

$\frac{x^4}{8a^4} = \frac{4 \times 4}{8 \times 81 \times 81} = 0.000304$

$\frac{x^6}{16a^6} = \frac{4 \times 4 \times 4}{16 \times 81 \times 81 \times 81} = 0.000007$

1.024394
9

Square root of 85 $=$ 9.219546, true except the last decimal.

3. Required the cube root of $a^3 + b^3$?

This being compared with the general theorem gives $a = x^3$, $b = y^3$, $m = 1$, $n = 3$. Hence $\overline{a^3 + b^3}\big|^{\frac{1}{3}} = a^{\frac{3}{3}} \times \overline{1 + \frac{1}{3} \times \frac{y^3}{x^3} + \frac{1}{3} \times \frac{1-3}{6} \times \frac{y^6}{x^6} + \frac{1}{3} \times \frac{1-3}{6} \times \frac{1-6}{9} \times \frac{y^9}{x^9}}$, &c. $= a \times \overline{1 + \frac{y^3}{3x^3} - \frac{y^6}{9x^6} + \frac{5y^9}{81x^9} - \frac{10y^{12}}{243x^{12}}}$, &c. And $\overline{a^3 - b^3}\big|^{\frac{1}{3}} = a \times \overline{1 - \frac{y^3}{3x^3} - \frac{y^6}{9x^6} - \frac{5y^9}{81x^9} - \frac{10y^{12}}{243x^{12}}}$, &c.

Let the cube root of 600 be required? Now $600\big|^{\frac{1}{3}} = 8 \times \overline{1 + \frac{88}{512}}\big|^{\frac{1}{3}}$. Then $y^3 = 88$, $x^3 = 512$, $m = 1$, and $n = 3$.

Then $1 \qquad\qquad 1.00000000$

$\frac{y^3}{3x^3} = \frac{88}{3 \times 512} = 0.05729166$

$\frac{y^6}{9x^6} = \frac{1}{9} \times \overline{\frac{88}{512}}\big|^2 = -\ 0.00328233$

$\frac{5y^9}{81x^9} = \frac{5}{81} \times \overline{\frac{88}{512}}\big|^3 = 0.00031341$

$\frac{10y^{12}}{243x^{12}} = \frac{10}{243} \times \overline{\frac{88}{512}}\big|^4 = -\ 0.00003591$

$\frac{22y^{15}}{729x^{15}} = \frac{22}{729} \times \overline{\frac{88}{512}}\big|^5 = 0.00000453$

$\frac{154y^{18}}{6561x^{18}} = \frac{154}{6561} \times \overline{\frac{88}{512}}\big|^6 = -\ 0.00000060$

$\frac{374y^{21}}{19683x^{21}} = \frac{374}{19683} \times \overline{\frac{88}{512}}\big|^7 = 0.00000008$

$\frac{935y^{24}}{59049x^{24}} = \frac{935}{59049} \times \overline{\frac{88}{512}}\big|^8 = -0.00000001$

Sum of the positive terms, 1.05760968
Sum of the negative terms, 0.00331885

Difference, - 1.05429083
8

Cube root of 600, $=$ 8.43432664

In operations of this kind, the nearest power to the given number, whether greater or less than it, is to be used, as by that means the series will converge more quickly.

10 Involution and evolution of an infinite series.

An infinite series may be involved to any given power, or any proposed root of a given series may be extracted by means of the following general theorem.

$z^m \times (a + bz + cz^2 + dz^3 + ez^4$, &c.$)^m = z^m$, multiplied by

$$
\begin{aligned}
& a^m + mba^{m-1}z + \left.\begin{array}{l} m \cdot \frac{m-1}{2} \cdot a^{m-2}b^2 \\ + ma^{m-1}c \end{array}\right\} z^2 \\
& + \left.\begin{array}{l} m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot a^{m-3}b^3 \\ + m \cdot \frac{m-1}{2} \cdot 2a^{m-2}bc \\ + ma^{m-1}d \end{array}\right\} z^3 \\
& + \left.\begin{array}{l} m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot a^{m-4}b^4 \\ + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot 3a^{m-3}b^2c \\ + m \cdot \frac{m-1}{2} \cdot a^{m-2} \begin{cases} 2bd \\ + c^2 \end{cases} \\ + ma^{m-1}e \end{array}\right\} z^4 \\
& + \left.\begin{array}{l} m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot \frac{m-4}{5} \cdot a^{m-5}b^5 \\ + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot 4a^{m-4}b^3c \\ + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot 3a^{m-3} \begin{cases} bc^2 \\ + b^2d \end{cases} \\ + m \cdot \frac{m-1}{2} \cdot 2a^{m-2} \begin{cases} cd \\ + be \end{cases} \\ + ma^{m-1}f \end{array}\right\} z^5 \\
& + \left.\begin{array}{l} m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot \frac{m-4}{5} \cdot \frac{m-5}{6} \cdot a^{m-6}b^6 \\ + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot \frac{m-4}{5} \cdot 5a^{m-5}b^4c \\ + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot \frac{m-3}{4} \cdot a^{m-4} \begin{cases} 6b^2c^2 \\ 4b\ d \end{cases} \\ + m \cdot \frac{m-1}{2} \cdot \frac{m-2}{3} \cdot a^{m-3} \begin{cases} 3b^2e \\ 6bcd \\ c^3 \end{cases} \\ + m \cdot \frac{m-1}{2} \cdot a^{m-2} \begin{cases} 2bf \\ 2ce \\ d^2 \end{cases} \\ + ma^{m-1}g \end{array}\right\} z^6
\end{aligned}
$$

&c.

Now

Series.

Nuw each term of the given feries is to be compared with the correfpondent terms in the firft part of the above theorem; and by fubftitution in the fecond, the feveral terms of the required feries will be obtained.

EXAMPLES.

1*ft*, What is the fquare of the feries $y - y^3 + y^5 - y^7 +$, &c.?

By comparing this with the general theorem, we find $z = y$, $a = 1$, $b = 0$, $c = -1$, $d = 0$, $g = -1$, &c. and $m = 2$; whence

$$\overline{y - y^3 + y^5 - y^7}\Big|^2 = y^2 \times \left(1 - 2ax^2 \begin{array}{l} + c^2x^4 - 2cex^6 \\ + 2ex^4 - 2\,g\,x^6 \end{array}\right), \text{ \&c.} = y^2 \times (1 - 2y^2 + 3y^4 - 4y^6)$$

&c. $= y^2 - 2y^4 + 3y^6 - 4y^8$, &c.

2*d*, Required the fourth power of the feries $1 + x + x^2 + x^3$, &c.?

Here $z = 1$, $a = 1$, $b = 1$, $c = 1$, $d = 1$, and $m = 4$.

$$\text{Then } \overline{1 + x + x^2 + x^3, \text{ \&c.}}\Big|^4 = 1 + 4bx \begin{array}{l} + 6b^2x^2 \\ + 4c \end{array} \begin{array}{l} + 4b^3x^3 \\ + 12bc \\ + 4d \end{array} \begin{array}{l} + b^4x^4, \text{ \&c.} \\ + 12b^2c \\ + 6c^2 \\ + 12bd \\ + 4e \end{array}$$

$$= 1 + 4x + 10x^2 + 20x^3 + 35x^4, \text{ \&c.}$$

3*d*, What is the fquare of $\frac{1}{x} + \frac{1}{x^2} + \frac{1}{x^3} + \frac{1}{x^4}$, &c.

In this cafe $z = \frac{1}{x}$, $x = \frac{1}{x}$, $a = 1$, $b = 1$, $c = 1$, $d = 1$, and $m = 2$.

$$\text{Then } \overline{\frac{1}{x} + \frac{1}{x} + \frac{1}{x^3} \text{\&c.}}\Big|^2 = \frac{1}{x^2} \times \left(1 + 2b \times \frac{1}{x} \begin{array}{l} + b^2 \\ + 2c \end{array} \times \frac{1}{x^2} \begin{array}{l} + 2bc \\ + 2d \end{array} \times \frac{1}{x^3} \begin{array}{l} + 2bd \\ + c^2 \\ + 2e \end{array} \times \frac{1}{x^4}, \text{ \&c.}\right.$$

$$= \frac{1}{x^2} \times \left(1 + \frac{2}{x} + \frac{3}{x^2} + \frac{4}{x^3} = \frac{5}{x^4}, \text{ \&c.}\right)$$

$$= \frac{1}{x^2} + \frac{2}{x^3} + \frac{3}{x^4} + \frac{4}{x^5} + \frac{5}{x^6}, \text{ \&c.}$$

4*th*, What is the fquare root of $\dfrac{1}{r^2 - \frac{z^2}{2} + \frac{z^9}{4r^2} - \frac{z^6}{6r^4} + \frac{z^8}{8r^6}, \text{ \&c.}}$

The quantity reduced is $\dfrac{1}{r^2} \times \dfrac{1}{1 - \frac{z^2}{2r^2} + \frac{z^4}{4r^2} - \frac{z^6}{6r^6} + \frac{z^8}{8r^8}, \text{ \&c.}}$

In this example $z = \frac{1}{r^2}$, $x = z^2$, $a = 1$, $b = -\frac{1}{2^2}$, $c = \frac{1}{4r^4}$, $d = -\frac{1}{6r^6}$, &c. and $m = -\frac{1}{2}$, $\frac{m-1}{2} = -\frac{3}{4}$, $\frac{m-2}{3} = -\frac{5}{6}$, $\frac{m-3}{4} = -\frac{7}{8}$, &c.

$$\text{Then } \frac{1}{r^2 - \frac{z^2}{2} + \frac{z^4}{4r^2}, \text{ \&c.}} = \frac{1}{r} \times \left(1 + \frac{x}{4r^2} \begin{array}{l} + \frac{3x^2}{32r^4} \\ - \frac{1}{8r^4} \end{array} \begin{array}{l} + \frac{5x^3}{128r^6}, \text{ \&c.} \\ - \frac{3}{32r^6} \\ + \frac{1}{12r^6} \end{array}\right.$$

$$= \frac{1}{r} + \frac{x}{4r^3} + \frac{x^2}{32r^5} + \frac{11x^3}{384r^7}, \text{ \&c.}$$

11 Of an harmonical feries.

Harmonic SERIES, a feries of terms formed in harmonical proportion. It has been already obferved in the article PROPORTION, that if three numbers be in harmonical proportion, the firft is to the third as the difference between the firft and fecond is to the difference between the fecond and third.

Let a, b, and x be three terms in harmonical proportion: then $a : x :: a - b : b - x$

whence $ax - bx = ab - ax$.

and $2ax - bx = ab$.

then $x = \frac{ab}{2a - b}$. Hence the three firft terms of this feries is a, b, $\frac{ab}{2a - b}$.

The thod tend ferie

Again, let x be the fourth term, to find which in terms of a and b, we have

$$b : x :: b - \frac{ab}{2a - b} : \frac{ab}{2a - b} - x$$

$$\text{Then } bx - \frac{ab}{2a - b} \cdot x = \frac{ab^2}{2a - b} - bx$$

$$\frac{3ab - 2b^2}{2a - b} \cdot x = \frac{ab^2}{2a - b}$$

$$x = \frac{ab^2}{2a - b} \cdot \frac{2a - b}{3ab - 2b^2} = \frac{ab}{3a - 2b};$$

therefore the fuur firft terms are a. b. $\frac{ab}{2a - b}$, $\frac{ab}{3a - 2b}$.

Whence the law of the feries is obvious, and it may be continued

Series.

continued as follows, $a.\ b.\ \frac{ab}{2a-b}, \frac{ab}{3a-2b}, \frac{ab}{4-3b}, \frac{ab}{5a-4b}$, &c. and the n^{th} term is $\frac{ab}{\overline{n-1}.a-\overline{n-2}.b}$.

13 'he first 'rm less ıan the cond, and ɔth positive, the ries will 'come negative.

If, in a series of terms in harmonical proportion, a and b be two affirmative quantities, aod such that $a < b$, then this series, which is positive at first, will become negative as soon as $\overline{n-2}.b$ exceeds $\overline{n-1}.a$. But if $a > b$, the series will converge, and although produced to infinity, will not become negative.

14 ıt if the ıt is eater ın the 'ond, the 'ies is affirmative.

Let a and b be equal to 2 and 1 respectively; then this series becomes $\frac{2}{1}.\frac{2}{2}.\frac{2}{3}.\frac{2}{4}$, &c. and since, if each term of an harmonical series be divided by the same quantity, the series will still be harmonical. Therefore $\frac{1}{1}.\frac{1}{2}.\frac{1}{3}.\frac{1}{4}.\frac{1}{5}$, &c. is an harmonical series: wheoce the denominators of this series form a series of numbers in arithmetical progression; and conversely, the reciprocals of an arithmetical progression are in harmonical proportion.

15 ıe reciɔcals of arithtical ɔgression harmoıal proportion, l conversely.

Recurring Series, a series of which any term is formed hy the addition of a certain number of preceding terms, multiplied or divided by any determinate numbers whether positive or negative. Thus 2. 3. 19. 101. 543. 2917. 15671, &c. is a recurring series, each term of which is formed by the addition of the two preceding terms, the first of which being previously multiplied by the constant quantity 2 and the other by 5. Thus the third term $19 = 2\times2+3\times5$; the fourth term $101 = 3\times2+19\times5$, &c.

16 ımmaı of a ırring es.

The principal operation in a series of this nature is that of finding its sum.—For this purpose, the two first and two last terms of the series must be given, together with the constant multipliers.

Let a, b, c, d, e, f, &c. be any number of terms of a series formed according to the above law, each successive term being equal to the sum of the products of the two preeeding terms, the first being multiplied by the given quantity m, and the other hy the given quantity n. Hence we will have the following series of equations $c = ma+nb$, $d = mb+nc$, $e = mc+nd$, $f = md+ne$, &c. Then adding these equations we obtain $c+d+e+f = m\times\overline{a+b+c+d}+n\times\overline{b+c+d+e}$. Now the first member of this equation is the snm of all the terms except the two first; the quantity by wbich m is multiplied in the second member is the sum of all the terms except the two last; and that by which n is multiplied is the sum of all the terms except the first aod last. Now let s = sum of the series; then $s-a-b = m\times\overline{s-e-f}+n\times\overline{s-a-f}$

Hence $s = \frac{m\times\overline{e+f}+n\times\overline{a+f}-a-b.}{m+n-1.}$

Let the sum of the first seven terms of the above series be required.

Two last terms	15671 2917	First term	2
		Last term	15671
Sum - -	18588	Sum	15673
m -	2	n -	5
	37176		78365
	78365		
Sum - -	115541		
$-\overline{2+3}$	5		
$2+5-1=6$	115536		
	19256 = Sum of the series.		

Series.

Reversion of Series, is the method of finding the value of the quantity whose several powers are involved in a series, in terms of the quantity which is equal to the given series.

In order to this, a series must be assumed, which being involved and substituted for the quantity equal to the series, and its powers, neglecting those terms whose powers exceed the highest power to which it is proposed to extend the series.

Let it be required to revert the series $ax+bx^2+cx^3+dx^4+ex^5$, &c. $= y$; or, to find x in an infinite series expressed in the powers of y.

Substitute y^n for x, and the indices of the powers of y in the equation will be n, $2n$, $3n$, &c. and 1, therefore $n=1$; and the differences are 0. 1. 2. 3. 4. 5. &c. Hence, in this case, the series to be assumed is $Ay+By^2+Cy^3+Dy^4$, &c. which being involved and substituted for the respective powers of x, then we have

$$\left.\begin{array}{ll} ax = & aAy+aBy^2+aCy^3+aDy^4, \text{\&c.} \\ bx^2 = & \left.\begin{array}{r}+bA^2y^2+2bABy^3+2bACy^4 \\ +bB^2y^4\end{array}\right\} \text{\&c.} \\ cx^3 = & \qquad\qquad +cA^3y^3+3cA^2By^4, \text{\&c.} \\ dx^4 = & \qquad\qquad\qquad +dA^4y^4, \text{\&c.} \end{array}\right\} = y$$

Whence, by comparing the homologous terms, we have $aAy = y$; therefore $A = \frac{1}{a}$, $B = \frac{b}{a^3}$, $C \left(= -\frac{2bAB+cA^3}{a}\right) = \frac{2b^2-ac}{a^5}$; $D \left(= -\frac{2bAC+bB^2+3cA^2B+dA^4}{a}\right) = \frac{5abc-5b^3-a^2d}{a^7}$, &c. and consequently $x = \frac{y}{a} - \frac{by^2}{a^3} + \frac{2b^2-ac}{a^5}\times y^3 - \frac{5b^3-5abc+a^2d}{a^7}\times y^4$, &c.

Examples.

1*st*, Let $x-\frac{x^2}{2}+\frac{x^3}{3}-\frac{x^4}{4}$, &c. $= y$. There a being in this case equal to 1, $b = -\frac{1}{2}$, $c\ \frac{1}{3}$, $d = -\frac{1}{4}$, &c. we shall, by substituting these values, have $x = y+\frac{y^2}{2}+\frac{y^3}{6}+\frac{y^4}{24}$, &c.

2*d*, Let $x-x^2+x^3-x^4+x^5$, &c. $= y$; to find x?

In this example we have $x = x$, $a = 1$, $b = -1$, $c = 1$, $d = -1$, &c.; whence $x = \frac{y}{1}+\frac{1}{1}y^2+\frac{2-1}{1}y^3+\frac{-5+5-1}{1}y^4$, &c. $= y+y^2+y^3+y^4$ &c.

3*d*, Let $a = r-\frac{x^2}{2r}+\frac{x^4}{24r^3}-\frac{x^6}{720r^5}+\frac{x^8}{4032r^7}$, &c. to find x?

Put $r-a = v$; then $v = \frac{x^2}{2r}-\frac{x^4}{24r^3}+\frac{x^6}{720r^5}-\frac{x^8}{4032r^7}$, &c. By comparison we find $x = x^2$, $y = v$, $a = \frac{1}{2r}$, $b = \frac{-1}{24r^3}$, $c = \frac{1}{720r^5}$, $d = \frac{-1}{4032r^7}$, &c.

Hence

$$\text{Hence } x^2 = 2rv - \frac{\frac{-1}{24r^4}}{\frac{1}{8r^3}}v^2 + \frac{\frac{1}{288r^6} - \frac{1}{1440r^6}}{\frac{1}{32r^5}}$$

v^3, &c. $= 2rv + \frac{1}{3}v^2 + \frac{4}{45r}v^3 + \frac{1}{35r^2}v^4$, &c. whence $x = \sqrt{2rv} \times \left(1 + \frac{v}{12r} + \frac{3v^2}{160r^2} + \frac{5v^3}{896r^3}\right.$, &c.

Summation of SERIES is the method of finding the sum of the terms of an infinite series produced to infinity, or the sum of any number of terms of such a series.

The value of any arithmetical series, as $1^2 + 2^2 + 3^2 + 4^2 \ldots\ldots\ldots n^2$, varies according as ($n$) the number of its terms varies; and therefore, if it can be expressed in a general manner, it must be explicable by n and its powers with determinate coefficients; and those powers, in this case, must be rational, or such whose indices are whole positive numbers; because the progression, being a whole number, cannot admit of surd quantities. Lastly, It will appear, that the greatest of the said indices cannot exceed the common index of the series by more than unity; for, otherwise, when n is taken indefinitely great, the highest power of n would be indefinitely greater than the sum of all the rest of the terms.

Thus the highest power of n, in an expression exhibiting the value of $1^2 + 2^2 + 3^2 + 4^2 \ldots n^2$, cannot be greater than n^3; for $1^2 + 2^2 + 3^2 + 4^2 \ldots n^2$ is manifestly less than n^3, or $n^2 + n^2 + n^2 +$, &c. continued to n terms; but n^4, when n is indefinitely great, is indefinitely greater than n^3, or any other inferior power of n, and therefore cannot enter into the equation. This being premised, the method of investigation may be as follows:

EXAMPLES.

1. Required the sum of n terms of the series $1 + 2 + 3 + 4 + \ldots\ldots n$?

Let $An^2 + Bn$ be assumed, according to the foregoing observations, as an universal expression for the value of $1 + 2 + 3 + 4 \ldots\ldots n$, where A and B represent unknown but determinate quantities. Therefore, since the equation is supposed to hold universally, whatsoever is the number of terms, it is evident, that if the number of terms be increased by unity, or, which is the same thing, if $n + 1$ be wrote therein instead of n, the equation will still subsist; and we shall have $A \times \overline{n+1}|^2 + B \times \overline{n+1} = 1 + 2 + 3 + 4 \ldots\ldots n + \overline{n-1}$. From which the first equation being subtracted, there remains $A \times \overline{n+1}|^2 - An^2 + B \times \overline{n-1} - Bn = n + 1$; this contracted will be $2An + A + B = n + 1$; whence we have $\overline{2A - 1} \times n + A + B - 1 = 0$: Wherefore, by taking $2A - 1 = 0$, and $A + B - 1 = 0$, we have $A = \frac{1}{2}$, and $B = \frac{1}{2}$; and consequently $1 + 2 + 3 + 4 \ldots\ldots n\ (= An^2 + Bn) = \frac{n^2}{2} + \frac{n}{2} = \frac{n \times \overline{n+1}}{2}$.

What is the sum of the ten first terms of the series $1 + 2 + 3$, &c.?

In this case $n = 10$, then $\frac{n \times \overline{n+1}}{2} = \frac{10 \times 11}{2} = 55$.

2. Required the sum of the series $1^2 + 2^2 + 3^2 \ldots\ldots n^2$, or $1, + 4 + 9 + 16 \ldots\ldots n$?

Let $An^3 + Bn^2 + Cn$, according to the aforesaid observations, be assumed $= 1^2 + 2^2 + 3^2 \ldots\ldots n^2$; then, as in the preceding case, we shall have $A \times \overline{n+1}|^3 + B \times \overline{n+1}|^2 + C \times \overline{n+1} = 1^2 + 2^2 + 3^2 \ldots\ldots n^2 \times \overline{n+1}|^2$; that is, by involving $n + 1$ to its several powers, $An^3 + 3An^2 + 3An + A + Bn^2 + 2Bn + B + Cn + C = 1^2 + 2^2 + 3^2 \ldots n^2 + \overline{n+1}|^2$; from which subtracting the former equation, we obtain $3An^2 + 3An + A + 2Bn + B + C (= \overline{n+1}|^2) = n^2 + 2n + 1$; and consequently $\overline{3A - 1} \times n^2 + \overline{3A + 2B - 2} \times n + A + B + C - 1 = 0$; whence $3A - 1 = 0$, $3A + 2B - 2 = 0$, and $A + B + C - 1 = 0$; therefore $A = \frac{1}{3}$, $B = \frac{2 - 3A}{3} = \frac{1}{2}$, $C = 1 - A - B = \frac{1}{6}$, and consequently $1 + 4 + 9 + 16 \ldots\ldots n^2 = \frac{n^3}{3} + \frac{n^2}{2} + \frac{n}{6}$, or $\frac{n \cdot \overline{n+1} \cdot \overline{2n+1}}{6}$.

What is the sum of the ten first terms of the series $1^2 + 2^2 + 3^2$, &c.?

Here $n = 10$, then $\frac{n \cdot \overline{n+1} \cdot \overline{2n+1}}{6} = \frac{10 \times 11 \times 21}{6} = 385$.

3. Required the sum of the series $1^3 + 2^3 + 3^3 + 4^3 \ldots\ldots n^3$, or $1 + 8 + 27 + 64 \ldots\ldots n^3$?

By putting $An^4 + Bn^3 + Cn^2 + Dn = 1 + 8 + 27 + 64 \ldots n^3$; and proceeding as above, we shall have $4An^3 + 6an^2 + 4an + A + 3Bn^2 + 3Bn + B + 2Cn + C + D\ (= \overline{n+1}|^3) = n^3 + 3n^2 + 1$, and therefore $\overline{4A - 1} \times n^3 + \overline{6A + 3B - 3} \times n^2 + \overline{4A + 3B + 2C - 3} \times n + A + B + C + D - 1 = 0$. Hence $A = \frac{1}{4}$, $B \left(= \frac{3 - 6A}{3}\right) = \frac{1}{2}$, $C \left(= \frac{3 - 4A - 3B}{2}\right) = \frac{1}{4}$, $D\ (= 1 - A - B - C) = 0$; and therefore $1^3 + 2^3 + 3^3 + 4^3 \ldots\ldots n^3 = \frac{n^4}{4} + \frac{n^3}{2} + \frac{n^2}{4}$, or $= \frac{n^2 \times \overline{n+1}|^2}{4}$.

In the very same manner it will be found, that

$$1^4 + 2^4 + 3^4 \ldots\ldots n^4 = \frac{n^5}{5} + \frac{n^4}{2} + \frac{n^3}{3} - \frac{n}{30}$$

$$1^5 + 2^5 + 3^5 \ldots\ldots n^5 = \frac{n^6}{6} + \frac{n^5}{2} + \frac{5n^4}{12} - \frac{n^2}{12}$$

$$1^6 + 2^6 + 3^6 \ldots\ldots n^6 = \frac{n^7}{7} + \frac{n^6}{2} + \frac{n^5}{2} - \frac{n^3}{6} + \frac{n}{42}.$$

What is the sum of the ten first terms of the series $1^3 + 2^3 + 3^3$, &c.?

$n = 10$, then $\frac{n^2 \times \overline{n+1}|^2}{4} = \frac{100 \times 121}{4} = 25 \times 121 = 3025$.

4. Required the sum of n terms of the series of triangular numbers $0, 1, 3, 6, 10 \ldots\ldots n$?

Let $An^3 + Bn^2 + Cn = 0, 1, 2, 3 \ldots\ldots n, = s$. — Now the $\overline{n+1}$th term of this series, by Example 2. is $\frac{n^2}{2} + \frac{n}{2}$. Then $A . \overline{n+1}|^3 + B . \overline{n+1}|^2 . C . \overline{n+1} = s + \frac{n^2}{2} + \frac{n}{2}$. Now, the first equation being subtracted from this, we have, $3An^2 + \overline{3A + 2B} \times n + A + B + C = \frac{n^2}{2} + \frac{n}{2}$. Or, $3An^2 + 3An +$

A

Series.

$A + C = \frac{n^2}{2} + \overline{\tfrac{1}{2} - 2B} \times n - B.$

Whence, by equating the homologous terms, we have $3A = \frac{1}{2}$, and $A = \frac{1}{6}$: $\frac{1}{2} - 2B = 3A$; whence $2B = \frac{1}{2} - \frac{1}{2} = 0$, $A + C = -B$. Hence $C = -\frac{1}{6}$. Now, these values being substituted in the above equation, gives the sum $= \frac{n^3}{6} - \frac{n}{6} =$

$\frac{n \cdot \overline{n-1} \cdot \overline{n+1}}{1 \cdot 2 \cdot 3}$; and if $n + 1$ be put for n, the sum of n terms of this series will be $\frac{n \cdot \overline{n+1} \cdot \overline{n+2}}{1 \cdot 2 \cdot 3}$.

By proceeding in the same manner, the sum of n terms of pyramidal numbers, 1, 4, 10, 20, 35, &c. .... n will be found $= \frac{n \cdot \overline{n+1} \cdot \overline{n+2} \cdot \overline{n+3}}{1 \cdot 2 \cdot 3 \cdot 4}$. And the sum of any series of figurate numbers, is determined by a like formula, the law of continuation being obvious.

What is the sum of the ten first terms of triangular numbers 1, 3, 6, 10, 15, &c.?

Here $n = 10$; then $\frac{n \cdot \overline{n+1} \cdot \overline{n+2}}{1 \cdot 2 \cdot 3} = \frac{10 \times 11 \times 12}{6}$ $= 220$.

5. Let the sum of the series $\frac{1}{R} + \frac{2}{R^2} + \frac{3}{R^3}$ continued to n terms, be required?

If we multiply this series indefinitely continued by $\overline{R-1}|^2$, or $R^2 - 2R + 1$, the product is R; therefore the amount of the indefinite series is $\frac{R}{\overline{R-1}|^2}$, and the sum of n terms may be found by subtracting the terms after the nth from that amount. Now, the terms after the nth are $\frac{n+1}{R^{n+1}} + \frac{n+2}{R^{n+2}}$, &c. which may be divided into the two following series:

First, $\frac{n}{R^n} \times \overline{\frac{1}{R} + \frac{1}{R^2} + \frac{1}{R^3}}$, &c. $= \frac{n}{R^n} \times \frac{1}{R-1}$.

Second, $\frac{1}{R^n} \times \overline{\frac{1}{R} + \frac{2}{R^2} + \frac{3}{R^3}}$, &c. $= \frac{1}{R^n} \times \frac{R}{\overline{R-1}|^2}$.

Now, if we write a for $\frac{1}{R^n}$, and r for $R - 1$, and subtract the sum of these two series from the amount of the proposed series indefinitely continued, the remainder will be found $= \frac{1-a}{r} \times R - \frac{na}{r}$.

6. Let the sum of the series $\frac{n-1}{nR} + \frac{n-2}{nR^2} + \frac{n-3}{nR^3}$ &c. be required?

This series is equal to the difference of the two following.

First, $\frac{n}{nR} + \frac{n}{nR^2} + \frac{n}{nR^3}$, &c. $= \frac{1}{R} + \frac{1}{R^2} + \frac{1}{R^3}$, &c. $= \frac{1-a}{r}$.

Second, $\frac{1}{nR} + \frac{2}{nR^2} + \frac{3}{nR^3}$, &c. $= \frac{1}{n} \times \overline{\frac{1}{R} + \frac{1}{R^2} + \frac{1}{R^3}}$, &c. $= \frac{1}{n} \times \frac{1-a}{r} \times R - \frac{a}{r}$.

The difference of these series is $\frac{1-a}{r} - \frac{R}{n} \times \frac{1-a}{r} + \frac{a}{r}$, which reduced becomes $\frac{\overline{n+a-1} \times r + a - 1}{nr^2}$.

To proceed farther would lead us far beyond the limits assigned for this article; we must therefore refer those who require more information on this subject to the following authors.—Bertrand's *Diveloppement*, &c. Vol. I; Dodson's Mathematical Repository, Vol. I.; Emerson's Algebra; Appendix to Gravesend's Algebra; Hutton's Paper on Cubic Equations and Infinite Series, in the Philosophical Transactions for 1780; Maclaurin's Fluxions; Malcom's Arithmetic; Masere's Annuities; and *Scriptores Logarithmici*, &c.; De Moivre's Doctrine of Chances, and a Paper by the same author in the Philosophical Transactions, N° 240; Simpson's Algebra, Essays, Fluxions, and Miscellanies; Sterling's *Summatio et Interpolatio Serierum; Syntagma Mathesios*, &c.

Seringapatam.

SERINGAPATAM, the capital of Mysore, the dominions of Tippoo Sultan, is situated in an island of the Cavery river, about 290 or 300 miles from Madras. The island, upon survey, appeared to be about four miles in length by one and a half in breadth, across the middle, where it is likewise highest, whence it gradually falls and narrows towards the extremities. The west end of the island, on which there is a fort of considerable strength, slopes more, especially towards the north; and the ground rising on the opposite side of the river commands a distinct view of every part of the fort. The fort and outworks occupy about a mile of the west end of the island, and are distinguished by magnificent buildings, and ancient Hindoo pagodas, contrasted with the more lofty and splendid monuments lately raised in honour of the Mahometan faith. The great garden, called the *Laul Baug*, covers about as much of the east end of the island as the fort and outworks do of the west, and the whole intermediate space, except a small enclosure on the north bank near the fort, was, before the last war, filled with houses, and formed an extensive suburb, of which the greatest part was destroyed by Tippoo to make room for batteries, to defend the island when attacked by the combined forces of Earl Cornwallis and the Mahratta chiefs in February 1792. This suburb, or town of modern structure, is about half a mile square, divided into regular cross streets, all wide, and shaded on each side by trees. It is surrounded by a strong mud wall, contains many good houses, and seems to have been preserved by the sultan for the accommodation of merchants, and for the convenience of troops stationed on that part of the island for its defence. A little to the eastward of the town is the entrance to the great garden, which was laid out in regular shady walks of large cypress trees, and abounding with fruit trees, flowers, and vegetables of every description. It possessed all the beauty and elegance of a country retirement, and was dignified by the mausoleum of Hyder the late soltan, and a superb new palace built by his son. This noble garden was devoted to destruction; and the trees which had shaded their proud master, and contributed to his pleasures, were formed into the means of protecting his enemies in subverting his empire. Before that event, so glorious to the arms of England, this insulated metropolis

(says Major Dirom) must have been the richest, most convenient, and beautiful spot possessed in the present age by any native prince in India; but when the allies left it, the Sultan's fort and city only remained in repair amidst all the wrecks of his former grandeur, the island presenting nothing but the appearance of wretched barrenness. Tippoo is a man of talents, enterprise, and great wealth; but, in the opinion of our author, the remaining years of his ill-fated life will be unequal to renew the beauties of his terrestrial paradise. N. Lat. 12° 31′ 45″. E. Long. 96° 46′ 45″.

SERINGHAM, an island of Indostan, formed about six miles north-west of Trinchinopoly by the river Cavery, which divides itself into two branches: that to the northward takes the name of *Coleroon*, but the southern branch preserves its old name the *Cavery*. Both these rivers, after a course of about 90 miles, empty themselves into the sea; the Coleroon at Devicottah, and the Cavery near Tranquebar, at about 20 miles distance from one another. In this island, facing Trinchinopoly, stood a famous pagoda surrounded by seven square walls of stone, 25 feet high and four feet thick. The space between the outward and second walls measured 310 feet, and so proportionably of the rest. Each enclosure had four large gates, with a high tower; which were placed, one in the middle of each side of the enclosure, and opposite to the four cardinal points. The outward wall was about four miles in circumference, and its gateway to the south was ornamented with pillars, some of which were single stones 33 feet in length and five in diameter; while those that formed the roof were still larger; and in the inmost enclosure were the chapels. About half a mile to the east was another large pagoda called *Jumbikistna*, which had but one enclosure.

The pagoda of Seringham was held in great veneration, from a belief that it contained the identical image of the god Wistnou worshipped by Brama; and pilgrims came here from all parts of India with offerings of money to procure absolution. A large part of the revenue of the island was allotted for the maintenance of the Bramins who inhabited the pagoda; and these, with their families, formerly amounted to no fewer than 40,000 persons, all maintained by the superstitious liberality of the adjacent country.

SERIOLA, in botany: A genus of plants belonging to the order of polygamia æqualis, and to the class of syngenesia; and in the natural system ranged under the 49th order, *Compositæ*. The receptacle is paleaceous; the calyx simple; and the pappus is somewhat plumose. There are four species; 1. The levigata. 2. Æthnensis. 3. Cretensis. 4. Urens. The first is a native of the island of Candia, and flowers in July and August; the second is a native of Italy; and the fourth is a native of the south of Europe.

SERIPHIUM, in botany: a genus of plants belonging to the order of monogamia, and to the class of syngenesia. The calyx is imbricated: the corolla is monopetalous and regular, with one oblong seed under it. There is only one species, the *cinereum*, which is a native of the Cape of Good Hope.

SERIPHUS (anc. geog.), one of the Cyclades or islands in the Ægean sea, called *Saxum Seriphium* by Tacitus, as if all a rock; one of the usual places of banishment among the Romans. The people *Seriphii*; who, together with the Siphnii, joined Greece against Xerxes, were almost the only islanders who refused to give him earth and water in token of submission, (Herodotus). *Seriphia Rana*, a proverbial saying concerning a person who can neither sing nor say; frogs in this island being said to be dumb, (Pliny).

SERMON, a discourse delivered in public, for the purpose of religious instruction and improvement.

Funeral Sermon. See *Funeral Orations*.

SERON of almonds, is the quantity of two hundred weight; of anise seed, it is from three to four hundred; of Castile soap, from two hundred and a half to three hundred and three quarters.

SEROSITY, in medicine, the watery part of the blood.

SERPENS, in astronomy, a constellation in the northern hemisphere, called more particularly *Serpens Ophiuchi*. The stars in the constellation Serpens, in Ptolemy's catalogue, are 18; in Tycho's, 13; in Hevelius's, 22; and in the Britannic catalogue, 64.

Serpens Biceps, or *Double-headed Snake*, a monster of the serpent kind, there being no permanent species of this conformation. That represented on Plate CCCCXLIX. and copied from Edwards, came from the island of Barbadoes; and was said to have been taken out of an egg of the size of a small pullet's egg by a man who found it under ground as he was digging. The heads were not in a horizontal position when the snake lay on its belly, but inclined to each other on their under sides, leaving an opening for the throat to come in between the two heads underneath, as is expressed at A. The upper side, for the whole length, was covered with small scales, falling one over another; the belly was covered with single scales running across it, in the form of half rings. It was all over of a yellowish colour, without any spots or variation. Mr Edwards also informs us, that a person brought to him a common English snake, which had two heads quite separate from each other, the necks parting about an inch from the head.

Serpens, *Serpent*, in the Linnæan system of zoology, an order of animals belonging to the class of *amphibia*, and comprehending six genera, viz, the *crotalus*, or rattle-snake; the *boa*, including ten species; the *coluber*, or viper; the *anguis*, or snake; the *amphisbæna*, or annulated snake, the body and tail of which are composed of angular segments; and the *cæcilia*, or tentaculated snake, the body and tail of which are wrinkled, without scales, and the upper part furnished with two feelers: and including two species. See an account of these genera under their respective names.

1 Distinguishing character of serpents.

The characters of serpents, according to Linnæus, are these: They are amphibious animals, breathing through the mouth by means of lungs only; having a tapering body, no distinct neck; the jaws not articulated, but dilatable; and destitute of feet, fins, and ears.

2 General observations.

The serpent has from the beginning been the enemy of man; and it has hitherto continued to terrify and annoy him, notwithstanding all the arts which have been practised to destroy it. Formidable in itself, it deters the invader from the pursuit; and from its figure, capable of finding shelter in a little space, it is not easily discovered by those who would venture to encounter it. Thus possessed at once of potent arms, and inaccessible or secure retreats, it baffles all the arts

Serpents. arts of man, though ever so earnestly bent upon its destruction. For this reason, there is scarce a country in the world that does not still give birth to this poisonous brood, that seems formed to quell human pride, and repress the boasts of security. Mankind have driven the lion, the tiger, and the wolf, from their vicinity; but the snake and the viper still defy their power.

Their numbers, however, are thinned by human assiduity; and it is possible some of the kinds are wholly destroyed. In none of the countries of Europe are they sufficiently numerous to be truly terrible. The various malignity that has been ascribed to European serpents of old is now utterly unknown; there are not above three or four kinds that are dangerous, and their poison operates in all in the same manner. The drowsy death, the starting of the blood from every pore, the insatiable and burning thirst, the melting down the solid mass of the whole form into one heap of putrefaction, said to be occasioned by the bites of African serpents, are horrors with which we are entirely unacquainted.

But though we have thus reduced these dangers, having been incapable of wholly removing them, in other parts of the world they still rage with all their ancient malignity. In the warm countries that lie within the tropics, as well as in the cold regions of the north, where the inhabitants are few, the serpents propagate in equal proportion. But of all countries those regions have them in the greatest abundance where the fields are unpeopled and fertile, and where the climate supplies warmth and humidity. All along the swampy banks of the river Niger or Oroonoko, where the sun is hot, the forests thick, and the men but few, the serpents cling among the branches of the trees in infinite numbers, and carry on an unceasing war against all other animals in their vicinity. Travellers have assured us, that they have often seen large snakes twining round the trunk of a tall tree, encompassing it like a wreath, and thus rising and descending at pleasure.—We are not, therefore, to reject as wholly fabulous the accounts left us by the ancients of the terrible devastations committed by a single serpent. It is probable, in early times, when the arts were little known, and mankind were but thinly scattered over the earth, that serpents, continuing undisturbed possessors of the forest, grew to an amazing magnitude; and every other tribe of animals fell before them. It then might have happened, that serpents reigned the tyrants of a district for centuries together. To animals of this kind, grown by time and rapacity to 100 or 150 feet in length, the lion, the tiger, and even the elephant itself, were but feeble opponents. That horrible fœtor, which even the commonest and the most harmless snakes are still found to diffuse, might, in these larger ones, become too powerful for any living being to withstand; and while they preyed without distinction, they might thus also have poisoned the atmosphere around them. In this manner, having for ages lived in the hidden and unpeopled forest, and finding, as their appetites were more powerful, the quantity of their prey decreasing, it is possible they might venture boldly from their retreats into the more cultivated parts of the country, and carry consternation among mankind, as they had before desolation among the lower ranks of nature. We have many histories of antiquity, presenting us such a picture, and exhibiting a whole nation sinking under the ravages of a single serpent. At that time man had not learned the art of uniting the efforts of many to effect one great purpose. Opposing multitudes only added new victims to the general calamity, and increased mutual embarrassment and terror. The animal was therefore to be singly opposed by him who had the greatest strength, the best armour, and the most undaunted courage. In such an encounter, hundreds must have fallen; till one, more lucky than the rest, by a fortunate blow, or by taking the monster in its torpid interval, and surcharged with spoil, might kill, and thus rid his country of the destroyer. Such was the original occupation of heroes; and those who first obtained that name, from their destroying the ravagers of the earth, gained it much more deservedly than their successors, who acquired their reputation only for their skill in destroying each other. But as we descend into more enlightened antiquity, we find these animals less formidable, as being attacked in a more successful manner. We are told, that while Regulus led his army along the banks of the river Bagrada in Africa, an enormous serpent disputed his passage over. We are assured by Pliny, that it was 120 feet long, and that it had destroyed many of the army. At last, however, the battering engines were brought out against it; and these assailing it at a distance, it was soon destroyed. Its spoils were carried to Rome, and the general was decreed an ovation for his success. There are, perhaps, few facts better ascertained in history than this: an ovation was a remarkable honour; and was given only for some signal exploit that did not deserve a triumph: no historian would offer to invent that part of the story at least, without being subject to the most shameful detection. The skin was kept for several years after in the Capitol; and Pliny says he saw it there. At present, indeed, such ravages from serpents are scarce seen in any part of the world; not but that, in Africa and America, some of them are powerful enough to brave the assaults of men to this day.

Nequeunt expleri corda tuendo
Terribiles oculos villosaque setis pectora.

If we take a survey of serpents in general, they have marks by which they are distinguished from all the rest of animated nature. They have the length and the suppleness of the eel, but want fins to swim with; they have the scaly covering and pointed tail of the lizard, but they want legs to walk with; they have the crawling motion of the worm, but, unlike that animal, they have lungs to breathe with: like all the reptile kind, they are resentful when offended; and nature has supplied them with terrible arms to revenge every injury.

3 Conformation of their mouth.

Though they are possessed of very different degrees of malignity, yet they are all formidable to man, and have a strong similitude of form to each other. With respect to their conformation, all serpents have a very wide mouth in proportion to the size of the head; and what is very extraordinary, they can gape and swallow the head of another animal which is three times as big as their own. However, it is noway surprising that the skin of the snake should stretch to receive so large a morsel; the wonder seems how the jaws could take it in.

Serpents.

in. To explain this, it must be observed, that the jaws of this animal do not open as ours, in the manner of a pair of hinges, where bones are applied to bones, and play upon one another: on the contrary, the serpent's jaws are held together at the roots by a stretching muscular skin; by which means they open as widely as the animal chooses to stretch them, and admit of a prey much thicker than the snake's own body. The throat, like stretching leather, dilates to admit the morsel; the stomach receives it in part, and the rest remains in the gullet, till putrefaction and the juices of the serpent's body unite to dissolve it.

4 Their teeth.

Some serpents have fangs or canine teeth, and others are without them. The teeth in all are crooked and hollow; and, by a peculiar contrivance, are capable of being erected or depressed at pleasure.

5 Eyes.

The eyes of all serpents are small, if compared to the length of the body; and though differently coloured in different kinds, yet the appearance of all is malign and heavy; and, from their known qualities, they strike the imagination with the idea of a creature meditating mischief. In some, the upper eyelid is wanting, and the serpent winks only with that below; in others, the animal has a nictitating membrane or skin, resembling that which is found in birds, which keeps the eye clean and preserves the sight. The substance of the eye in all is hard and horny; the crystalline humour occupying a great part of the globe.

The holes for hearing are very visible in all: but there are no conduits for smelling; though it is probable that some of them enjoy that sense in tolerable perfection.

6 Tongue.

The tongue in all these animals is long and forky. It is composed of two long fleshy substances, which terminate in sharp points, and are very pliable. At the root it is connected very strongly to the neck by two tendons that give it a variety of play. Some of the viper kind have tongues a fifth part of the length of their bodies; they are continually darting them out; but they are entirely harmless, and only terrify those who are ignorant of the real situation of their poison.

7 Gullet.

If from the jaws we go on to the gullet, we shall find it very wide for the animal's size, and capable of being distended to a great degree; at the bottom of this lies the stomach, which is not so capacious, and receives only a part of the prey, while the rest continues in the gullet for digestion. When the substance in the stomach is dissolved into chyle, it passes into the intestines, and from thence goes to nourishment, or to be excluded by the vent.

8 Lungs and heart.

Like most other animals, serpents are furnished with lungs, which we suppose are serviceable in breathing, though we cannot perceive the manner in which this operation is performed; for though serpents are often seen apparently to draw in their breath, yet we cannot find the smallest signs of their ever respiring it again. Their lungs, however, are long and large, and doubtless are necessary to promote their languid circulation. The heart is formed as in the tortoise, the frog, and the lizard kinds, so as to work without the assistance of the lungs. It is single; the greatest part of the blood flowing from the great vein to the great artery by the shortest course. By this contrivance of nature we easily gather two consequences; that snakes are amphibious, being equally capable of living on land and in the water; and that they are also torpid in winter, like the bat, the lizard, and other animals formed in the same manner.

9 Mode of generation.

The vent in these animals serves for the emission of the urine and the fæces, and for the purposes of generation. The instrument of generation in the male is double, being forked like the tongue: the ovaries in the female are double also; and the aperture is very large, in order to receive the double instrument of the male. They copulate in their retreats; and it is said by the ancients, that in this situation they appear like one serpent with two heads.

10 Number of joints in the back bone.

As the body of the animal is long, slender, and capable of bending in every direction, the number of joints in the back bone are numerous beyond what one would imagine. In the generality of quadrupeds, they amount to not above 30 or 40; in the serpent kind they amount to 145 from the head to the vent, and 25 more from that to the tail. The number of these joints must give the back bone a surprising degree of pliancy; but this is still increased by the manner in which each of these joints is locked into the other. In man and quadrupeds, the flat surfaces of the bones are laid one against the other, and bound tight by sinews; but in serpents, the bones play one within the other like ball and socket, so that they have full motion upon each other in every direction.

11 Number of ribs.

Though the number of joints in the back bone is great, yet that of the ribs is still greater; for, from the head to the vent, there are two ribs to every joint, which makes their number 290 in all. These ribs are furnished with muscles, four in number; which being inserted into the head, run along to the end of the tail, and give the animal great strength and agility in all its motions.

12 Scales.

The skin also contributes to its motions, being composed of a number of scales, united to each other by a transparent membrane, which grows harder as it grows older, until the animal changes, which is generally done twice a-year. This cover then bursts near the head, and the serpent creeps from it by an undulatory motion, in a new skin, much more vivid than the former. If the old slough be then viewed, every scale will be distinctly seen like a piece of net-work, and will be found greatest where the part of the body they covered was largest.

There is much geometrical neatness in the disposal of the serpent's scales, for assisting the animal's sinuous motion. As the edges of the foremost scales lie over the ends of their following scales, so those edges, when the scales are erected, which the animal has a power of doing in a small degree, catch in the ground, like the nails in the wheel of a chariot, and so promote and facilitate the animal's progressive motion. The erecting these scales is by means of a multitude of distinct muscles with which each is supplied, and one end of which is tacked each to the middle of the foregoing.

In some of the serpent kind there is the exactest symmetry in these scales; in others they are disposed more irregularly. In some there are larger scales on the belly, and often answering to the number of ribs; in others, however, the animal is without them. Upon this slight difference, Linnæus has founded his distinctions of the various classes of the serpent tribe.

13 Their

When we come to compare serpents with each other, the

Serpens. the first great distinction appears in their size; no other tribe of animals differing so widely in this particular. This tribe of animals, like that of fishes, seems to have no bounds put to their growth: their bones are in a great measure cartilaginous, and they are consequently capable of great extension: the older, therefore, a serpent becomes, the larger it grows; and as they seem to live to a great age, they arrive at an enormous size.

Leguat assures us, that he saw one in Java that was 50 feet long. Carli mentions their growing to above 40 feet; and we have now the skin of one in the British Museum that measures 32. Mr Wentworth, who had large concerns in the Berbices in America, assures us, that in that country they grow to an enormous length. He one day sent out a soldier, with an Indian, to kill wild fowl for the table; and they accordingly went some miles from the fort: in pursuing their game, the Indian, who generally marched before, beginning to tire, went to rest himself upon the fallen trunk of a tree, as he supposed it to be; but when he was just going to sit down, the enormous monster began to move; and the poor savage perceiving that he had approached a *boa*, the greatest of all the serpent kind, dropped down in an agony. The soldier, who perceived at some distance what had happened, levelled at the serpent's head, and by a lucky aim shot it dead: however, he continued his fire until he was assured that the animal was killed; and then going up to rescue his companion, who was fallen motionless by its side, he, to his astonishment, found him dead likewise, being killed by the fright. Upon his return to the fort, and telling what had happened, Mr Wentworth ordered the animal to be brought up, when it was measured, and found to be 36 feet long. He had the skin stuffed, and then sent to Europe as a present to the prince of Orange, in whose cabinet it was lately to be seen at the Hague: but the skin is shrunk, by drying, two or three feet. In the East Indies they grow also to an enormous size, particularly in the island of Java, where, we are assured, that one of them will destroy and devour a buffalo. See Boa.

14 Gluttony, But it is happy for mankind that the rapacity of these frightful creatures is often their punishment; for whenever any of the serpent kind have gorged themselves in this manner, whenever their body is seen particularly distended with food, they then become torpid, and may be approached and destroyed with safety. Patient of hunger to a surprising degree, whenever they seize and swallow their prey, they seem, like surfeited gluttons, unwieldy, stupid, helpless, and sleepy: they at that time seek some retreat, where they may lurk for several days together, and digest their meal in safety: the smallest effort at that time is capable of destroying them; they can scarce make any resistance: and they are equally unqualified for flight or opposition: that is the happy opportunity of attacking them with success; at that time the naked Indian himself does not fear to assail them. But it is otherwise when this sleepy interval of digestion is over; they then issue, with famished appetites, from their retreats, and with accumulated terrors, while every animal of the forest flies before them.

15 Abstinence. But though these animals are of all others the most voracious, and though the morsel which they swallow without chewing is greater than what any other creature, either by land or water, can devour; yet no animals upon earth bear abstinence so long as they. A single meal, with many of the snake kind, seems to be the adventure of a season; it is an occurrence, of which they have been for weeks, nay sometimes for months, in patient expectation. When they have seized their prey, their industry for several weeks is entirely discontinued; the fortunate capture of an hour often satisfies them for the remaining period of their annual activity. As their blood is colder than that of most other terrestrial animals, and as it circulates but slowly through their bodies, so their powers of digestion are but feeble. Their prey continues, for a long time, partly in the stomach, partly in the gullet, and is often seen in part hanging out of the mouth. In this manner it digests by degrees; and in proportion as the part below is dissolved, the part above is taken in. It is not therefore till this tedious operation is entirely performed, that the serpent renews its appetite and its activity. But should any accident prevent it from issuing once more from its cell, it still can continue to bear famine for weeks, months, nay for years together. Vipers * are often kept in boxes for six or eight months, without any food whatever; and there are little serpents sometimes sent over to Europe from Grand Cairo, that live for several years in glasses, and never eat at all, nor even stain the glass with their excrements.

* See *Abstinence*.

16 Food. Other creatures have a choice in their provision; but the serpent indiscriminately preys upon all; the buffalo, the tyger, and the gazelle. One would think that the porcupine's quills might be sufficient to protect it; but whatever has life serves to appease the hunger of these devouring creatures: porcupines, with all their quills, have frequently been found in their stomachs when killed and opened; nay, they very frequently are seen to devour each other.

17 Places which they frequent. A life of savage hostility in the forest offers the imagination one of the most tremendous pictures in nature. In those burning countries, where the sun dries up every brook for hundreds of miles round; when what had the appearance of a great river in the rainy season, becomes, in summer, one dreary bed of sand; in those countries, a lake that is never dry, or a brook that is perennial, is considered by every animal as the greatest convenience of nature. When they have discovered this, no dangers can deter them from attempting to slake their thirst. Thus the neighbourhood of a rivulet, in the heart of the tropical continents, is generally the place where all the hostile tribes of nature draw up for the engagement. On the banks of this little envied spot, thousands of animals of various kinds are seen venturing to quench their thirst, or preparing to seize their prey. The elephants are perceived in a long line, marching from the darker parts of the forest; the buffaloes are there, depending upon numbers for security; the gazelles relying solely upon their swiftness; the lion and tyger waiting a proper opportunity to seize; but chiefly the larger serpents are upon guard there, and defend the accesses of the lake. Not an hour passes without some dreadful combat; but the serpent, defended by its scales, and naturally capable of sustaining a multitude of wounds, is, of all others, the most formidable. It is the most wakeful also; for the whole tribe sleep with their eyes open, and are consequently for ever upon the watch: so that, till their rapacity is satisfied,

few

Serpens. few other animals will venture to approach their station.

18 The found which they utter. In comparing ferpents as to their voices, fome are found filent, fome have a peculiar cry; but hiffing is the found which they moft commonly fend forth, either as a call to their kind, or as a threat to their enemies. In the countries where they abound, they are generally filent in the middle of the day, when they are obliged to retire from the heat of the climate; but as the cool of the evening approaches, they are then heard iffuing from their cells with continued hiffings; and fuch is the variety of their notes, that fome have affured us they very much refemble the mufic of an Englifh grove. This fome will hardly credit; at any rate, fuch notes, however melodious, can give but very little delight, when we call to mind the malignity of the minftrel. If confidered, indeed, as they anfwer the animal's own occafions, they will be found well adapted to its nature, and fully anfwering the purpofes of terrifying fuch as would venture to offend it.

19 How they move. With refpect to motion, fome ferpents, particularly thofe of the viper kind, move flowly; while others dart with amazing fwiftnefs. The motion in all is fimilar; but the ftrength of body in fome gives a very different appearance. The viper, that is but a flow feeble-bodied animal, makes way in a heavy undulating manner; advancing its head, then drawing up its tail behind, and bending the body into a bow; then from the fpot where the head and tail were united, advancing the head forward as before. This, which is the motion of all ferpents, is very different from that of the earthworm, or the naked fnail. The ferpent, as was faid above, has a back bone, with numerous joints; and this bone the animal has a power of bending in every direction, but without being able to fhorten or lengthen it at pleafure. The earthworm, on the other hand, has no back bone; but its body is compofed of rings, which, like a barber's puff it can lengthen or fhorten as it finds neceffary. The earthworm, therefore, in order to move forward, lengthens the body; then by the fore part clings to the ground where it has reached, and then contracts and brings up its rear: then, when the body is thus fhortened, the fore part is lengthened again for another progreffion, and fo on. The ferpent, inftead of fhortening the body, bends it into an arch; and this is the principal difference between ferpentine and vermicular progreffion.

We have inftanced this motion in the viper, as moft eafily difcerned; but there are many ferpents that dart with fuch amazing fwiftnefs, that they appear rather to leap than crawl. It is moft probable, however, that no ferpent can dart upon even ground farther than its own length at one effort. Our fears indeed may increafe the force of their fpeed, which is fometimes found fo fatal. We are told by fome, that they will dart to a very great diftance; but this we have never been able to afcertain. The manner of progreffion in the fwifteft ferpent we know, which is the jaculus, is by inftantly coiling itfelf upon its tail, and darting from thence to its full extent: then carrying the tail, as quick as lightning to the head; coiling and darting again; and by this means proceeding with extreme rapidity, without ever quitting the ground. Indeed, if we confider the length and the weaknefs of the back bone in all thefe animals; if we regard the make of the vertebræ, in which we fhall find the junctures all formed to give play, and none to give power; we cannot be of opinion that they have a faculty of fpringing from the ground, as they entirely want a *fulcrum*, if we may fo exprefs it, from whence to take their fpring; the whole body being compofed of unfupported mufcles and joints that are yielding.

20 Though amphibious, yet they die when immerfed in water. Though all ferpents are amphibious, fome are much fonder of the water than others; and though deftitute of fins or gills, remain at the bottom, or fwim along the furface with great eafe. From their internal ftructure, we fee how well adapted they are for either element: and how capable their blood is of circulating at the bottom as freely as in the frog or the tortoife. They can, however, endure to live in frefh water only; for falt is an effectual bane to the whole tribe. The greateft ferpents are moft ufually found in frefh water, either choofing it as their favourite element, or finding their prey in fuch places in the greateft abundance. But that all will live and fwim in liquids, appears from an experiment of Redi; who put a ferpent into a large glafs veffel of wine, where it lived fwimming about fix hours; though, when it was by force immerfed and put under that liquid, it lived only one hour and a half. He put another in common water, where it lived three days; but when it was kept under water, it lived only about 12 hours. Their motion there, however, is perfectly the reverfe of what it is upon land; for, in order to fupport themfelves upon an element lighter than their bodies, they are obliged to increafe their furface in a very artificial manner. On earth their windings are perpendicular to the furface; in water they are parallel to it: in other words, if a perfon fhould wave his hand up and down, it will give an idea of the animal's progrefs on land; if to the right and left, it will give fome idea of its progrefs on the water.

21 Fœtor. Some ferpents have a moft horrible fœtor attending them, which is alone capable of intimidating the brave. This proceeds from two glands near the vent, like thofe in the weafel or polecat; and, like thofe animals, in proportion as they are excited by rage or by fear the fcent grows ftronger. It would feem, however, that fuch ferpents as are moft venomous are leaft offenfive in this particular; fince the rattlefnake and the viper have no fmell whatever; nay, we are told, that at Calicut and Cranganon, in the Eaft Indies, there are fome very noxious ferpents, who are fo far from being difagreeable, that their excrements are fought after, and kept as the moft pleafing perfume. The Efculapian ferpent is alfo of this number.

22 Some viviparous, others oviparous. Some ferpents bring forth their young alive, as the viper; fome bring forth eggs, which are hatched by the heat of their fituation, as the common black fnake, and the majority of the ferpent tribe. When a reader, ignorant of anatomy, is told, that fome of thofe animals produce their young alive, and that fome produce eggs only, he is apt to fuppofe a very great difference in the internal conformation, which makes fuch a variety in the manner of bringing forth. But this is not the cafe: thefe animals are internally alike, in whatever manner they produce their young; and the variety in their bringing forth is rather a flight than a real difcrimination. The only difference is, that the viper hatches her eggs, and brings them to maturity, within her body; the fnake is more premature in her productions,

2

tions, and sends her eggs into the light some time before the young ones are capable of leaving the shell. Thus, if either are opened, the eggs will be found in the womb, covered with their membranous shell, and adhering to each other like large beads on a string. In the eggs of both, the young ones will be found, though at different stages of maturity: those of the viper will crawl and bite in the moment the shell that encloses them is broke open: those of the snake are not yet arrived at their perfect form.

Father Labat took a serpent of the viper kind that was nine feet long, and ordered it to be opened in his presence. He then saw the manner in which the eggs of these animals lie in the womb. In this creature there were six eggs, each of the size of a goose egg, but longer, more pointed, and covered with a membranous skin, by which also they were united to each other. Each of these eggs contained from 13 to 15 young ones, about six inches long, and as thick as a goose-quill. Though the female from whence they were taken was spotted, the young seemed to have a variety of colours very different from the parent; and this led the traveller to suppose that the colour was no characteristic mark among serpents. These little mischievous animals were no sooner let loose from the shell, than they crept about, and put themselves into a threatening posture, coiling themselves up and biting the stick with which he was destroying them. In this manner he killed 74 young ones; those that were contained in one of the eggs escaped at the place where the female was killed, by the bursting of the egg and their getting among the bushes.

The fascinating power ascribed to serpents, especially to rattlesnakes, by which they are said to draw animals to them, is very curious. It has been described by so many different persons, who affirmed that they had seen instances of it, and has been believed by so many men of penetration and discernment, that it deserves at least to be mentioned. The rattlesnake fixes its eyes upon any animal, such as a bird or squirrel. When the animal spies the snake, it skips from spray to spray, hovering and approaching nearer the enemy; descending, with distracted gestures and cries, from the top of the loftiest trees to the mouth of the snake, who opens his jaws, and in an instant swallows the unfortunate animal.

The following instances of fascination have so much the appearance of fiction, that it would require a very uncommon degree of evidence to render them credible. They are extracted from a paper in the Gentleman's Magazine for the year 1765, p. 511. which was communicated by Mr Peter Collinson from a correspondent in Philadelphia.

"A person of good credit was travelling by the side of a creek or small river, where he saw a ground squirrel running to and fro between the creek and a great tree a few yards distant; the squirrel's hair looking very rough, which showed he was scared, and his returns being shorter and shorter, the man stood to observe the cause, and soon spied the head and neck of a rattlesnake pointing at the squirrel through a hole of the great tree, it being hollow; the squirrel at length gave over running, and laid himself quietly down with his head close to the snake's; the snake then opened his mouth wide, and took in the squirrel's head; upon which the man gave the snake a whip across the neck, and so the squirrel being released, he ran into the creek.

"When I was about 13 years old, I lived with William Atkinson, an honest man in Bucks county, who, returning from a ride in warm weather, told us, that while his horse was drinking at a run, he heard the cry of a blackbird, which he spied on the top of a sapling, fluttering and straining the way he seemed unwilling to fly, and holding so fast the sprigs he was perched upon that the sappling top bent. After he had viewed the bird a few minutes, it quitted the place, and made a circle or two higher in the air, and then resumed its former standing, fluttering and crying: Thereupon William rode the way the bird strained, and soon spied a large black snake in coil, steadily eyeing the bird. He gave the snake a lash with his whip, and this taking off the snake's eye from his prey, the charm was broken, and away fled the bird, changing its note to a song of joy.

"Mr Nicholas Scull, a surveyor, told me, that when he was a young man, as he happened once to be leaning upon a fence, and looking over it, he saw a large rattlesnake in coil, looking stedfastly at him. He found himself surprised and listless immediately, and had no power for about a minute (as he thinks) but to look at the snake, and then he had the resolution to push himself from the fence, and turn away, feeling such horror and confusion as he would not undergo again for any consideration.

"Doctor Chew tells me, a man in Maryland was found fault with by his companion that he did not come along; the companion stepping towards him, observed that his eyes were fixed upon a rattlesnake which was gliding slowly towards him, with his head raised as if he was reaching up at him; the man was leaning towards the snake, and saying to himself, *he will bite me! he will bite me!* Upon which his companion caught him by the shoulder, and pulled him about, and cried out, *What the devil ails you? He will bite you sure enough!* This man found himself very sick after his enchantment."

The fascinating power of serpents was believed by Dr Mead and other eminent men, who certainly thought they had sufficient evidence for admitting it. Incredible therefore as it appears, it ought not to be rejected without examination; though being of a very extraordinary nature, it cannot be received without unquestionable evidence. Scepticism is no less absurd than incredulity; and the true philosopher will carefully avoid both. Human knowledge is founded on observation and experience; not, however, on every man's personal observation and experience, but on the united observation and experience of all mankind. But this presupposes the credibility of human testimony in every case that does not involve an impossibility. All the laws of nature are not yet known, nor all the wonderful powers of which she is possessed. It is not more incredible *à priori*, that the eye of a serpent should attract an animal than that a magnet should attract a piece of iron, or a piece of iron attract electrical matter. The evidence of these facts rests entirely on personal observation or authentic testimony. The only thing requisite with respect to objects of testimony is, when the fact is so extraordinary as has not fallen within the observation of the generality of men, the strength of

of the evidence muſt be in proportion to the extraordinary nature of the fact. To apply this to the preſent caſe: We have the teſtimony of many perſons that ſome ſerpents have a power of faſcination; but the generality of men have never obſerved this; it is therefore an extraordinary fact, and requires extraordinary evidence. But the evidence is not ſatisfactory; therefore we do not receive it as a fact: on the other hand, it is unphiloſophical to reject it *à priori*.

43
How their poiſon operates.

No ſubject has excited more philoſophical controverſy than the poiſon of ſerpents, with regard to its nature and mode of operating. Antiquity has not been ſparing in conjecture and fiction upon this ſubject, and its errors have been retained with the moſt reverential obſtinacy by the vulgar: among theſe we are to reckon the fictitious ſting fixed in the tail of the ſerpent, as the painters ſometimes have groundleſsly enough repreſented it; ſome have invented a ſimilar fiction of a black forked tongue, which the ſerpent vibrates on both ſides, and have aſcribed its power of producing ſuch noxious effects to this; while others, affecting an air of ſuperior diſcernment, have, upon equally good reaſons, aſcribed it to the teeth in general: theſe are all errors of a magnitude that the moſt deſultory attention to the ſubject would have been ſufficient to have removed. There is a very ſmall bone cloſely fixed to the upper jaw, in the inſide of the lip of a poiſonous ſerpent, which has a power of moving backward or forward; to this two or three fangs are annexed larger than the teeth, which the ſerpent, by its aſſiſtance, when enraged, darts forward, or withdraws and conceals at his pleaſure, in a ſimilar manner to the claws of a cat: theſe fangs, which the common people name the large teeth of the ſerpent, are excellently deſcribed by Tyſon in the anatomy of the rattleſnake, which he has given in the Philoſophical Tranſactions. "In theſe (the fangs) we obſerved a conſiderable cavity near the baſe; and near the point a very diſcernible fiſſure of ſome length like the ſlit of a pen: the part of the tooth from the fiſſure to the root was manifeſtly channelled, which we firſt diſcovered by lightly preſſing the gums; we then ſaw the poiſon aſcend through the cavity of the fang and flow out of the fiſſure; and as theſe fangs are ſo very acute, ſo firm and ſolid toward the point (the fiſſure being on the external and convex, not the internal ſide); nothing could be conceived more convenient either for inflicting a wound, or to enſure the infuſion of the poiſon." Each of the fangs is ſurrounded with a vehicle furniſhed with glands ſecreting a certain fluid; which, upon the veſicle being preſſed, ſeems to flow out of the point of the fang. The ſerpent when incenſed, raiſing his head, extends the ſmall bone armed with the fangs mentioned above; and attacking his enemy with a force combined of the weight of his body and the action of the muſcles, he wounds him with the expanded fangs, and the veſicle being compreſſed the poiſon immediately flows into the wound: this is clear from the experience of thoſe who, having broken off their fangs with a pair of forceps, handled the ſerpent thus diſarmed without any hurt. The North Americans, after carefully extracting theſe venomous fangs, ſuffer the rattleſnake to bite and gnaw them with his teeth till the blood flows freely, with total impunity.

Antiquity amuſed itſelf with a fable deſtitute of all appearance of truth, that anger was excited by black bile: they applied this fiction without heſitation to the preſent ſubject, and founded an hypotheſis upon it, to account for the effects of the bite of an incenſed ſerpent; pretending to have diſcovered an ideal canal which conducted the bile from its veſicle to the mouth of the ſerpent, whence it flowed to the part bitten, and produced the moſt fatal ſymptoms. But toward the end of the laſt century, this ſubject was greatly illuſtrated under the auſpices of Ferdinand II. great duke of Tuſcany: This prince, deſirous of inquiring into that myſterious queſtion, the nature of ſerpents, invited Steno, Rhedi, and ſome other philoſophers of the firſt eminence, to his court; and a multitude of the moſt poiſonous ſerpents being collected, Rhedi made ſeveral experiments upon them, which diſcovered to him a number of particulars before unknown; of which the following ſeem to have the beſt claim to our attention. When he either cauſed a living viper to bite a dog, or wounded him with the teeth of one newly dead (the poiſonous veſicle remaining unbroken), the event was the ſame. If the bite was repeated, its effect became weaker, and at laſt was loſt, the poiſon contained in the veſicle being totally exhauſted. That the teeth of ſerpents, when extended to bite, were moiſtened over with a certain liquor; and when the veſicle at the baſe was preſſed, a drop of poiſon flowed to the point of the fang. When the poiſon thus flowing from the veſicle was received in ſoft bread or a ſponge, an animal bitten by the ſerpent received no more harm from the wound than from being pricked with a needle, till after a few days, when the venom was reſtored afreſh: but when an animal was wounded with the point of a needle dipped in the poiſon, it was tormented with the ſame pains as if it had been bitten by the viper itſelf. Preſerving ſome of this poiſon in a glaſs, and totally evaporating the moiſture in the ſun, when the reſiduum was diluted again with water, and the point of a needle dipped in the ſolution, Rhedi found to his great ſurpriſe that it had the ſame effect as when recent. But the boldneſs of Tozzi, one who charmed vipers, flung all theſe men who were deeply verſed in natural philoſophy into the utmoſt aſtoniſhment. They happening to fall into diſcourſe (while the prince was preſent) upon the certain death which would attend any perſon's ſwallowing this poiſon of the viper by miſtake, inſtead of ſpirit of wine or water; Tozzi, confiding in his art, drank a conſiderable portion of it without heſitation: they were all aſtoniſhed at his apparent raſhneſs, and predicted inſtant death to the man; however, he eſcaped as ſafely as if he had drunk only ſo much water. This event, which ſtruck the prince and his illuſtrious aſſociates in theſe philoſophical inquiries by its novelty, was well known to the ancients. Lucan, in the 9th book of the Pharſalia, ſpeaking of the ſerpent, ſays,

Noxia ſerpentum eſt admiſto ſanguine peſtis
Morſu virus habent et fatum dente minantur,
Pocula morte carent. Phar. l. 9. v. 614.

Mix'd with the blood that venom ſlays alone,
His bite is poiſon; death is in his fang;
Yet is the draught innoxious.

Nor muſt we omit obſerving, that barbarous nations are perfectly acquainted with the property of the poiſon of ſerpents by which it retains its deadly power af-

Serpent.

ter it has been long kept: they have been possessed of this fatal secret for ages past; it being their custom to tinge the points of their arrows with the juice of spurge, putrid flesh, or oil of tobacco, but more particularly with the poison of vipers. Some modern Indians continue the practice to this day; and we have the testimony of Pliny, in his Natoral History, that the Scythians had long ago the same custom: "The Scythians (says that anthor) dip their arrows in the poison of vipers and human blood; a horrid practice, as the slightest wound inflicted by one of them defies all the art of medicine."

The poison of serpents produces fatal effects only by mixing with the blood. To confirm this principle, the Florentine philosophers collected a quantity of poison, and gave it to different animals without producing the least inconvenience; but wheo applied to an external wound, every one of those horrid symptoms which accompany the real bite followed, viz. inflammatory and malignant fevers, ending in death, unless nature, by a spontaneous hemorrhage, or some other evacuation, discharged this poison. With respect to the experiments of Rhedi, every one of his observations prove, that the liquid pressed out of the vesicle which moistens the fangs of the serpents is only noxious by being conveyed into the blood, by means of a puncture or wound; and the case of Tozzi, who drank a considerable quantity of this poison without suffering injury, proves that it hurts the blood only when externally mixed with it.

24 [Sym]ptoms [atten]ding [the b]ite of [diffe]rent [serpe]nts.

The symptoms of the bite of the viper have already been described under MEDICINE, N°408, with the cures recommended by Dr Mead for the bite of serpents in general. Under the article POISON, p. 269, we have mentioned the Abbé Fontana's method of cure, viz. ligatures, and the beneficial effects of the volatile alkali. We shall now therefore supply what has been omitted in these articles, by describing the symptoms which accompany the bite of other serpents.

The symptoms attending the bite of the *coluber prester*, a native of Sweden, are, pain in the wound, tumor, thirst, asthma, anxieties, convulsions, and death.

There is a serpent still more dreadful than any of the former, found in Sweden, called *coluber curcin*. The bite of this is followed by immediate change of colour, coldness, stupor, palpitation of the heart, acote pain all over the body, and death. Linnæus tried oil in this case, bot it proved ineffectual.

The *crotalus horridus* of Linnæus, the rattlesnake, kills in a very sudden manner; his bite usoally producing death within twelve hours.

The following account of the poison serpent of the East Indies is given by M. d'Obsonville: "Among the serpents of India, that which I believe to be most formidable is but about two feet long, and very small. Its skin is freckled with little traits of brown or pale red, and contrasted with a ground of dirty yellow: it is mostly found in dry and rocky places, and its bite mortal in less than one or two minutes. In the year 1759, and io the province of Cadapet, I saw several instances of it; and among others, one very singular, in the midst of a corps of troops commanded by M. de Bussy. An Indian Gentoo merchant perceived a Mahometan soldier of his acquaintance going to kill one of these reptiles, which he had found sleeping under his packet, the Gentoo flew to beg its life, protesting it would do no hurt if it was not first provoked; passing at the same time his hand under its belly to carry it out of the camp, when suddenly it twisted round, and bit his little finger; upon which this unfortunate martyr of a fanatic charity gave a shriek, took a few steps, and fell down insensible. They flew to his assistance, applied the serpent-stone, fire, and scarifications, but they were all ineffectual, his blood was already coagulated. About an hour after, I saw the body as they were going to burn it, and I thought I perceived some indications of a complete dissolution of the blood.

"The *serpens brulans*, or burning serpent, is nearly of the same form with the last mentioned; its skin is not quite of so deep a brown, nod is speckled with dark green spots; its poison is almost as dangerous, but it is less active, and its effects are very different: in some persons it is a devouring fire, which, as it circulates through the veins, presently occasions death; the blood dissolves into a lymphatic liquor, resembling thin broth, without apparently having passed through the intermediate state of coagulation, and runs from eyes, nose, and ears, and even through the pores. In other subjects, the poison seems to have changed the very nature of the humours in dissolving them; the skin is chapped and becomes scaly, the hair falls off, the members are tumefied, the patient feels all over his body the most racking pains, numbness, and is not long in perishing. It is said, however, that people have been cured by remedies well and soon applied. Be that as it may, it seems to me that the poison of these different reptiles is in general more powerful the more they live in hot and dry places, where they feed upon iosects that are full of saline, volatile, and acrimonious particles."

We are ignorant of what species the *hemorrhois* was, which is described by Lucan as causing by its bite a flux of blood from every part of the body. But the bite of ao American serpent named *de la crux* kills in the same manner.

The *dipsas* is at present likewise unknowo. Lucan informs us, that the person wounded by it was attacked by an unquenchable thirst. This is finely painted by him; where A. Tuscus, standard-bearer of Cato, is described as bitten by that serpent:

Non decus imperii, non mæsti jura Catonis
Ardentem tenuere virum, quin spargere signa
Auderet, totisque furens exquireret agris
Quas poscebat aquas sitiens in corde venenum.
Pharsal. l. 9.

His wild impatience, not his honour'd state,
Nor sorrowing Cato's high command, restrain;
Furious, dishonour'd in the dust, he flings
His sacred eagle, and o'er all the fields
Rapid he bursts to seek the cooling stream,
To quench the thirsty poisoo in his breast.

And a few verses after:

Scrutatur venas penitus squalentis arenæ
Nunc redit ad Syrtes, et fluctus accipit ore,
Aquoreasque placet, sed non sibi sufficit humor,
Nec sentit fatique genus, mortemque veneni,
Sed putat esse sitim; ferroque aperire tumentes
Sustinuit venas, atque os implere cruore.

 Now

Serpent.

Now tearing up the sands, some latent vein
Frustrate he seeks; now to the Syrtes shore
Return'd, he swallows down the briny flood
Mix'd with its rolling sands; nor knows his fate
And the sad poison's death, but calls it thirst;
Then with his sword opens his spouting veins,
And drinks the bursting blood.——

The *phytas*, or *amodytes* of Linnæus, or, according to others, the *coluber aspis*, seems to have been the serpent made use of by Cleopatra to destroy herself. This woman, to terminate a dissipated life with an easy death, ordered her physicians to prepare a poison for her which might best effect this purpose. Having tried a number of different experiments upon condemned criminals, they at last discovered this species of asp, which brings on death without any previous appearance of distemper or hiccough: the face seems in a slight perspiration, an easy insensibility and lethargy creeps upon the whole frame, and the person bitten seems almost totally ignorant of his approaching dissolution. Having acquainted the queen with their discovery, she applied the asp either to her bosom or her arms; or, according to some authors, dipping the point of a needle in the poison, and pricking herself with it, she expired in an easy sleep.

The bite of the *naja* is so fatal, that a man dies by it in the space of an hour, his flesh entirely falling off his bones in a semidissolved putrid state: this makes it probable that it is the same serpent which the ancients named the *sepe*.

The experiments of Rhedi, have not, in the opinion of some celebrated philosophers, so far cleared the theory of the operation of the poison of the viper, as to leave nothing further to be desired upon that subject. Fontana and Carminati have endeavoured to investigate its operations more clearly. Carminati, from 11 experiments, deduces the following conclusions: 1. That if poison be instilled into a nerve, the animal wounded dies almost instantly; and the whole nervous system, to which it is rapidly conveyed, is deprived of its quality called *sensibility*. 2. If a muscle be wounded, it is deprived of its irritability. This is confirmed by the experiments of Fontana. 3. The poison injected into a wounded muscle or tendon is considerably longer in killing an animal than that introduced into a nerve. 4. The symptoms which precede the death of the animal bitten are, a stupor, lethargy, tremors, convulsions, paralysis of the legs (part wounded), entire dissolution of the limbs. The blood is not always coagulated, nor its crasis dissolved. Marks of inflammation are sometimes discovered in certain parts of the animal after death, sometimes not: these are the effects of spasms and convulsions, not of the poison. 5. Not the least sign of the jaundice was discoverable in the eyes of any of the animals upon which Carminati made his experiments. 6. The stomach in every one of them was very much inflated; a symptom remarked only by Fallopius and Albertini. 7. A ligature applied instantly above the part bitten, if it be so placed as to admit one, was found by some experiments a good preventive against the diffusion of the poison: its compression should be considerable, but not excessive.

As few serpents, comparatively speaking, are poisonous, it may be interesting to our readers to know what are the characteristics which distinguish poisonous from harmless serpents. The external characteristics of the poisonous tribe are these:

25 How to distinguish poisonous serpents.

"1. A broad head, covered with small scales, though it be not a certain criterion of venomous serpents, is, with some few exceptions, a general character of them.

Phil. Trans. Vol. LXXIX.

"2. A tail under one-fifth of the whole length is also a general character of venomous serpents; but, since many of those which are not venomous have tails as short, little dependence can be placed upon that circumstance alone. On the other hand, a tail exceeding that proportion, is a pretty certain mark that the species to which it belongs is not venomous.

"3. A thin and acute tail is by no means to be considered as peculiar to venomous serpents; though a thick and obtuse one is only to be found among those which are not venomous.

"4. Carinated scales are, in some measure, characteristic of venomous serpents, since in them they are more common than smooth ones, in the proportion of nearly four to one; whereas smooth scales are, in those serpents which are not venomous, more common, in the proportion of nearly three to one.

"Upon the whole, therefore, it appears, that though a pretty certain conjecture may, in many instances, be made from the external characters, yet, in order to determine with certainty whether a serpent be venomous or not, it becomes necessary to have recourse to some certain diagnostic. This can only be sought for in the mouth: we must therefore next consider how the fangs, with which the mouths of venomous serpents are furnished, are to be distinguished from common teeth.

"To those who form their ideas of the fangs of a venomous serpent, from those of the rattlesnake, or even from those of the English viper, it will appear strange that there should be any difficulty in distinguishing those weapons from common teeth; and indeed the distinction would really be very easy, were all venomous serpents furnished with fangs as large as those of the fore-mentioned species. But the fact is, that in many species the fangs are full as small as common teeth, and consequently cannot, by their size, be known from them; this is the case with the *coluber laticaudatus, lacteus*, and several others."

Linnæus thought that the fangs might be distinguished by their mobility and situation; but other naturalists have not found it a general fact that fangs are loose in their sockets, nor have they observed any difference in situation between the fangs of venomous serpents and the teeth of others. The following distinction is established by Dr Gray in a paper inserted in the Philosophical Transactions, Vol. LXXIX. *All venomous serpents have only two rows of teeth in the upper jaw, and all others have four.*

In the preface to the *Museum Regis*, and in the introduction to the class amphibia in the *Systema Naturæ*, Linnæus says, that the proportion of venomous serpents to others is one in ten; yet, in the *Systema Naturæ*, in which the sum total of species is 131, he has marked 23 as venomous, which is somewhat more than one in six. How he came to be so much at variance with himself, it is not easy to say; but the last-mentioned proportion seems to be not far from the truth, as Dr Gray, after examining 154 species of serpents, found only 26 that seemed to be venomous.

Serpents.

The *coluber stolatus* and *mycterizans*, though marked by Linnæus, we are assured by Dr Gray are not poisonous: he thinks the same may be said of the *leberis* and *dypsas*. On the other hand, he observes, that the *boa contortrix*, *coluber*, *cerastes*, *laticaudatus*, and *coluber fulvus*, none of which are marked in the *Systema Naturæ*, are all poisonous.

In addition to the method of cure mentioned in the articles referred to above, we shall subjoin the prescription of a new author, Dr Moseley *, who spent 12 years in the West Indies, and whose abilities and extensive practice very justly entitle his opinion to a place in this work, to the attention of the public, and to all medical gentlemen going to the West Indies.

"The bites and stings of all venomous animals are cured by the same local means; which are very simple, if they were always at hand. The injured part must be instantly destroyed or be cut out. Destroying it is the most safe, and equally certain: and the best application for that purpose is the lapis infernalis or the butter of antimony.—These are preferable to a hot iron, which the ancients used, because a hot iron forms a crust, which acts as a defence to the under parts, instead of destroying them. The lapis infernalis is much better than any other caustic, as it melts and penetrates during its application. The bitten part must be destroyed to the bottom, and where there is any doubt that the bottom of the wound is not sufficiently exposed, butter of antimony should be introduced into it on the following day, as deep as possible; and incisions should be made to lay every part open to the action of these applications. Besides destroying, burning, or cutting out the part, incisions should be made round the wound, to prevent the communication of the virus. The wound is to be dressed for some time with poultices, to assuage the inflammation caused by the caustics; and afterwards with acrid dressings and hot digestives to drain the injured parts.

"Where the above-mentioned caustics cannot be procured, corrosive sublimate, oil of vitriol, aquafortis, spirit of salt, common caustic, or a plaster made of quicklime, and soap, may be applied to the wound. Gunpowder laid on the part, and fired, has been used with success. When a person is bitten remote from any assistance, he should make a tight ligature above the part, until proper application can be made. The Spanish writers say, that the *habilla de Carthagena*, or Carthagena bean, is a specific for poisonous bites, taken inwardly.

"Ulloa says, it is 'one of the most effectual antidotes known in that country (Carthagena) against the bites of vipers and serpents: for a little of it being eaten immediately after the bite, it presently stops the effects of the poison; and accordingly all who frequent the woods, either for felling trees or hunting, never fail to eat a little of this habilla fasting, and repair to their work without any apprehension.

"The natives tell you, that this habilla being hot in the highest degree, much of it cannot be eaten; that the common dose of it is less than the fourth part of a kernel; and that no hot liquor, as wine, brandy, &c. must be drunk immediately after taking it.'

"The Carthagena bean, or habilla, is found in great abundance in the West Indian islands, where it is generally known by the name of *Antidote*, or *Cocoon*, or *Antidote Cocoon*. In small doses it is stomachic and diaphoretic; and in large doses emetic and purgative. In several disorders it is a powerful remedy; but its virtues are not sufficiently known, except among the Indians and negroes, who chiefly use an infusion or tincture of it made in rum. This is externally as well as internally used for many complaints (A).

"I have been informed by some intelligent Indians, that any of the red peppers, such as bird pepper, or hell pepper, or what is called *Cayenne pepper*, powdered and taken in a glass of rum as much as the stomach can possibly bear, so as to cause, and keep up for some time, great heat and inflammation in the body and a vigorous circulation, will stop the progress of the poison of serpents, even after its effects are visible; and that the bitten part only afterwards mortifies and separates, and that the patient, with bark, wine, and cordials, soon recovers.

"This fiery practice is certainly agreeable to that of the ancients, and probably the only internal treatment that can have any good effect; as in these cases the powers of life, and the action of the heart, are suddenly enfeebled, and the pulse in strength and frequency observes almost a regular declension from the time of the bite until it entirely ceases in death." 27

Why some serpents are poisonous.

Polygala senega, or rattlesnake root, was formerly considered as a sovereign remedy for the bite of the rattlesnake; but this opinion is now exploded.

If it be asked for what purpose were serpents created with such destructive weapons? we answer, that they were given for self-defence. Without these, serpents, of all other animals, would be the most exposed and defenceless; without feet for escaping a pursuit, without teeth capable of inflicting a dangerous wound, or without strength for resistance; incapable, from their size, of finding security in very small retreats like the earthworm, and disgusting all from their deformity, nothing was left for them but a speedy extirpation. But furnished as they are with powerful poison, every rank of animals approach them with dread, and never seize them but at an advantage. Nor is this all the benefit they derive from it. The malignity of a few serves for the protection of all. Though not above a tenth of their number are actually venomous, yet the similitude they all bear to each other excites a general terror of the whole tribe; and the uncertainty of their enemies about what serpents are poisonous, makes even the most harmless formidable. Thus Providence seems to have acted with double precaution: it has given some of them poison for the general defence of a tribe naturally feeble; but it has thinned the numbers of those which are venomous, lest they should become too powerful for the rest of animated nature.

From

(A) "This bean is the seed of the *Fevillea* foliis cordatis of Plumier, Ed. Burmanni, p. 203. Tab. 209. *Fevillea* foliis cordatis, angulatis, of Linnæus, Spec. P. *Fevillea* foliis crassiuribus, glabris, quandoque cordatis, quandoque trilobis, or *Antidote Cocoon*, of Brown, p. 374."

Serpent.

28 Enemies of serpents.

* See VIVERRA and SUS.

From these noxious qualities in the serpent kind, it is no wonder that not only man, but beasts and birds, carry on an unceasing war against them. The Ichneumon of the Indians, and the peccary* of America, destroy them in great numbers. These animals have the art of seizing them near the head; and it is said that they can skin them with great dexterity. The vulture and the eagle also prey upon them in great abundance; and often, sousing down from the clouds, drop upon a long serpent, which they snatch up struggling and writhing in the air. Dogs also are bred up to oppose them. Father Feuillée tells us, that being in the woods of Martinico, he was attacked by a large serpent, which he could not easily avoid, when his dog immediately came to his relief, and seized the assailant with great courage. The serpent entwined him, and pressed him so violently, that the blood came out of his mouth, and yet the dog never ceased till he had torn it to pieces. The dog was not sensible of his wounds during the fight; but soon after his head swelled prodigiously, and he lay on the ground as dead. But his master having found a banana tree hard by, he applied its juice mixed with treacle to the wounds, which recovered the dog, and quickly healed his sores.

† See PSYLLI.

29 Some persons famous for charming them.

The Psylli of old were famous for charming and destroying serpents †. Some moderns pretend to the same art. Casaubon says, that he knew a man who could at any time summon 100 serpents together, and draw them into the fire. Upon a certain occasion, when one of them, bigger than the rest, would not be brought in, he only repeated his charm, and it came forward, like the rest, to submit to the flames. Philostratus describes particularly how the Indians charm serpents: "They take a scarlet robe, embroidered with golden letters, and spread it before a serpent's hole.—The golden letters have a fascinating power; and by looking stedfastly, the serpent's eyes are overcome and laid asleep." These and many other feats have been often practised upon these animals by artful men, who had first prepared the serpents for their exercise, and then exhibited them as adventitiously assembled at their call. In India there is nothing so common as dancing serpents, which are carried about in a broad flat vessel, somewhat resembling a sieve. These erect and put themselves in motion at the word of command. When their keeper sings a slow tune, they seem by their heads to keep time; when he sings a quicker measure, they appear to move more brisk and lively. All animals have a certain degree of docility; and we find that serpents themselves can be brought to move and approach at the voice of their master. From this trick, successfully practised before the ignorant, it is most probable, have arisen most of the boasted pretensions which some have made to charming of serpents; an art to which the native Americans pretend at this very day, but the existence of which we are assured of by Mr Hasselquist amongst the native Egyptians.

30 Regarded with veneration in some countries.

Though the generality of mankind regard this formidable race with horror, yet there have been some nations, and there are some at this day, that consider them with veneration and regard. The adoration paid by the ancient Egyptians to a serpent is well known: many of the nations at present along the western coast of Africa retain the same unaccountable veneration. Upon the gold and slave coasts, a stranger, upon entering the cottages of the natives, is often surprised to see the roof swarming with serpents, that cling there without molesting and unmolested by the natives. But his surprise will increase upon going farther southward to the kingdom of Widah, when he finds that a serpent is the god of the country. This animal, which travellers describe as a huge overgrown creature, has its habitation, its temple, and its priests. These impress the vulgar with an opinion of its virtues; and numbers are daily seen to offer not only their goods, their provisions, and their prayers, at the shrine of their hideous deity, but also their wives and daughters. These the priests readily accept of, and after some days of penance return them to their suppliants, much benefited by the serpent's supposed embraces.

Serpent, a musical instrument, serving as a bass to the cornet, or *small shawm*, to sustain a chorus of singers in a large edifice. It has its name *serpent* from its figure, as consisting of several folds or wreaths, which serve to reduce its length, which would otherwise be six or seven feet.

It is usually covered with leather, and consists of three parts, a mouth-piece, a neck, and a tail. It has six holes, by means whereof it takes in the compass of two octaves.

Mersennus, who has particularly described this instrument, mentions some peculiar properties of it, *e. gr.* that the sound of it is strong enough to drown 20 robust voices, being animated merely by the breath of a boy, and yet the sound of it may be attempered to the softness of the sweetest voice. Another peculiarity to this instrument is, that great as the distance between the third and fourth hole appears, yet whether the third hole be open or shut, the difference is but a tone.

Serpent, in mythology, was a very common symbol of the sun, and he is represented biting his tail, and with his body formed into a circle, in order to indicate the ordinary course of this luminary, and under this form it was an emblem of time and eternity. The serpent was also the symbol of medicine, and of the gods which presided over it, as of Apollo and Æsculapius: and this animal was the object of very ancient and general worship, under various appellations and characters. In most of the ancient rites we find some allusion to the serpent, under the several titles of Ob, Ops, Python, &c. This idolatry is alluded to by Moses, (Lev. xx. 27.) The woman at Endor who had a familiar spirit is called Ouh, or Ob, and it is interpreted Pythonissa. The place where she resided, says the learned Mr Bryant, seems to have been named from the worship then instituted; for Endor is compounded of *En-ador*, and signifies *fons Pythonis*, "the fountain of light, the oracle of the god Adur, which oracle was probably founded by the Canaanites, and had never been totally suppressed. His pillar was also called *Abbadir*, or *Abadir*, compounded of *Ab* and *adir*, and meaning the serpent deity Addir, the same as Adurus.

In the orgies of Bacchus, the persons who partook of the ceremony used to carry serpents in their hands; and with horrid screams call upon Eva! Eva! Eva being, according to the writer just mentioned, the same as epha, or opha, which the Greeks rendered *ophis*, and by it denoted a serpent. These ceremonies and this

this symbolic worship began among the Magi, who were the sons of Chus; and by them they were propagated in various parts. Wherever the Amonians founded any places of worship, and introduced their rites, there was generally some story of a serpent. There was a legend about a serpent at Colchis, at Thebes, and at Delphi; and likewise in other places. The Greeks called Apollo himself Python, which is the same as Opis, Oupis, and Oub.

In Egypt there was a serpent named Thermuthis, which was looked upon as very sacred; and the natives are said to have made use of it as a royal tiara, with which they ornamented the statues of Isis. The kings of Egypt wore high bonnets, terminating in a round ball, and surrounded with figures of asps; and the priests likewise had the representation of serpents upon their bonnets.

Abadon, or Abaddon, mentioned in the Revelation ix. 2. is supposed by Mr Bryant to have been the name of the Ophite god, with whose worship the world had been so long infected. This worship began among the people of Chaldea, who built the city of Ophis upon the Tigris, and were greatly addicted to divination, and to the worship of the serpent. From Chaldea the worship passed into Egypt, where the serpent deity was called Canoph, Can-eph, and C'neph. It had also the name of Ob or Oub, and was the same as the Basiliscus or royal serpent, the same as the Thermuthis, and made use of by way of ornament to the statues of their gods. The chief deity of Egypt is said to have been Vulcan, who was styled Opas. He was the same as Osiris, the Sun, and hence was often called Ob-el, or Pytho-sol; and there were pillars sacred to him, with curious hieroglyphical inscriptions bearing the same name; whence among the Greeks, who copied from the Egyptians, every thing gradually tapering to a point was styled obelos, or obeliscus.

As the worship of the serpent began among the sons of Chus, Mr Bryant conjectures, that from thence they were denominated Ethiopians and Aithiopians, from Ath-ope or Ath-opes, the god whom they worshipped, and not from their complexion: the Ethiopes brought these rites into Greece, and called the island where they first established them *Ellopia, Solis Serpentis insula*, the same with *Eubœa*, or *Oubaia*, i. e. "the serpent island" The same learned writer discovers traces of the serpent worship among the Hyperboreans, at Rhodes, named Ophiusa, in Phrygia, and upon the Hellespont, in the island Cyprus, in Crete, among the Athenians, in the name of Cecrops, among the natives of Thebes in Bœotia, among the Lacedemonians, in Italy, in Syria, &c. and in the names of many places, as well as of the people where the Ophites settled. One of the most early heresies introduced into the Christian church was that of the Ophitæ. Bryant's Analysis of Ancient Mythology, Vol. I. p. 43, &c. p. 473, &c.

Serpent Stones. See *Corno Ammonis*.

Sea-Serpent. See *Sea-Serpent*.

SERPENTARIA, snake-root; a species of Aristolochia.

SERPENTARIUS, in astronomy, a constellation of the northern hemisphere, called also Ophiuchus, and anciently Æsculapius. The stars in the constellation Serpentarius, in Ptolemy's catalogue, are 29; in Tycho's 15; in Hevelius's 40; in the Britannic catalogue they are 74. Serpentine.

SERPENTINE, in general, denotes any thing that resembles a serpent; hence the worm or pipe of a still, twisted in a spiral manner, is termed a *serpentine worm*.

Serpentine-Stone, a genus of magnesian earths, of which there are different species: 1. The fibrosus, composed of fibrous and coherent particles. This resembles the asbestos so much that it might be confounded with it, were not the fibres of the serpentine so closely coherent, that they cannot be distinguished when the stone is cut or polished. The fibres themselves are large, and seem to be twisted. There are two varieties, a dark green and a light one; the former from Germany, the latter from Sweden. 2. The zoehlitz serpentine, found near that place, of many different colours, as black, deep green, light green, red, bluish-gray, and white; but the green colour is most predominant. 3. Porcelain earth mixed with iron. It is met with either diffusible in water or indurated. The former is found of a red colour from China and Montmartre. The water-clinkers, imported from some places in Germany, seem to be made of this kind of earth. There are two varieties of the indurated kind, viz. the martial soap earth, of a red colour, from Jasberg and other places in Norway, or black from some parts of Sweden. 4. The telgston of the Swedes, the same with the lapis ollaris. It is found in various places of Norway, as light gray, dark gray, whitish-yellow, and dark green. It is employed with great advantage for building fire-places, furnaces, &c. the extremities of the strata being turned towards the fire when it is slaty.

M. Magellan observes, that there is a great variety of colour as well as composition in this kind of stones; it being found either white, green, brown, yellow, light-blue, black, spotted, or streaked with veins of different colours. Its texture is either indistinct, obscurely laminar, or fibrous. The specific gravity is from 2400 to 2650; and it is harder than soap-rock or steatites; though not hard enough to strike fire with steel; being less smooth to the touch than steatites, but susceptible of a good polish, looking like marble; and is often met with in thin semitransparent plates. It melts in a strong heat without addition, and corrodes the crucibles, but hardens in a lower degree of heat. It is slowly and partially soluble in acids, but does not effervesce with them. According to Bayon's analysis, 100 parts of it contain about 41 of silex, or rather mica; 33 of magnesia; 40 of argillaceous earth; 12 of water, and about 3 of iron. That brought from Corsica contains a greater proportion of argil, and a smaller one of silex. The serpentine commonly so called, according to Fabroni, is a true lapis ollaris; but has its name from being variegated with green, yellowish, and brown spots, like the skin of some serpents; great quantities of it are found in Italy and Switzerland, where it is frequently worked into dishes and other vessels.

Serpentine *verses*, are such as begin and end with the same word. As,

Ambo florentes ætatibus, Arcades ambo.

Serpentine, in the *Manege*. A horse is said to have a serpentine tongue, if it is always frisking and moving, and sometimes passing over the bit, instead of keeping

keeping in the void space, called the liberty of the tongue.

SERPICULA, in botany; a genus of plants belonging to the class of monœcia, and to the order of tetrandia. The male calyx is quadridentate, and the corolla consists of four petals: The female calyx is divided into four parts, and the pericarpium is a tomentose nut. There are two species, the verticillata and repens.

SERPIGO, in surgery, a kind of herpes, popularly called a *tetter* or ringworm. See SURGERY.

SERPULA, in natural history; a genus belonging to the class of vermes, and to the order of testacea. The shell is single, tubular, and adhering to other bodies. The animal which inhabits it is the terebella.

SERRANUS (Joannes), or John de Serres, a learned French Protestant, was born about the middle of the sixteenth century. He acquired the Greek and Latin languages at Lausanne, and grew very fond of the philosophy of Aristotle and Plato. On his return to France he studied divinity. He began to distinguish himself in 1572 by his writings, but was obliged to forsake his country after the dreadful massacre of St Bartholomew. He became minister of Nismes in 1582, but was never regarded as a very zealous Calvinist: he has even been suspected, though without reason, of having actually abjured the Protestant religion. He was one of the four clergymen whom Henry IV. consulted about the Romish religion, and who returned for answer, *that Catholics might be saved.* He wrote afterwards a treatise in order to reconcile the two communions, entitled *De fide Catholica, sive de principiis religionis Christianæ, communi omnium Christianorum consensu, semper et ubique ratis.* This work was disliked by the Catholics, and received with such indignation by the Calvinists of Geneva, that many writers have affirmed that they poisoned the author. It is certain at least that he died at Geneva in 1598, at the age of 50. His principal works are, 1. A Latin translation of Plato, published by Henry Stephens, which owes much of its reputation to the elegance of the Greek copy which accompanies it. 2. A Treatise on the Immortality of the Soul. 3. *De statu religionis et reipublicæ in Francia.* 4. *Memoire de la 3me guerre civile et derniers troubles de France sous Charles IX. &c.* 5. *Inventaire general de l'Histoire de France, illustré par la conference de l'Eglise et de l'Empire, &c.* 6. *Recueil de chose memorable avenue en France sous Henri II. François II. Charles IX. Henri III.* These three historical treatises have been justly accused of partiality and passion; faults which it is next to impossible for a contemporary writer to avoid, especially if he bore any part in the transactions which he describes. His style is exceedingly incorrect and inelegant; his mistakes, too, and misstatements of facts, are very numerous.

SERRATED, in general, something indented or notched in the manner of a saw; a term much used in the description of the leaves of plants. See BOTANY.

SERRATULA, SAW-WORT, in botany: A genus of plants belonging to the class of syngenesia, and to the order of polygamia æqualis. In the natural system it is ranged under the 49th order, *Compositæ.* The calyx is subcylindrical, imbricated; the scales of it pointed, but not spinous. There are 15 species: The tinctoria, alpina, arvensis, coronata, japonica, salicifolia, multiflora, noveboracensis, præalta, glauca, squarrosa, scariosa, spicata, amara, and centauroides. The three first species are British. 1. The *tinctoria* is distinguished by a stem erect and slender, branched at the top, and three feet high. The leaves are smooth, pinnatifid, and serrated. The flowers are purple, in umbels, and terminal. The down of the seed is glossy, with a brown or gold tinge. It grows in woods and wet pastures. It gives cloth of an exceeding fine yellow colour, which stands well when fixed with alum. Goats eat this plant; horses are not fond of it; cattle, swine, and sheep, leave it untouched. 2. The *alpina*, or mountain saw-wort. The root and stem are woody; the latter being from one to two feet high. The leaves are numerous, triangular, long, pointed, substantial, dark green above, white beneath, and serrated, with round intervals between the teeth, on footstalks. The flowers are purple. The scales of the calyx are very short and downy. It grows on high mountains, and flowers commonly in July or August. 3. The *arvensis*, corn saw-wort, or way-thistle. The stem is generally erect, branched, and two or three feet high. The leaves are sinuated, serrated, and spinous; those above being almost entire. The flowers are of a pale purple; the down is very long. This plant grows in cultivated grounds and by waysides, and flowers in July or August. When burned it yields good ashes for making glass or fixed alkali.

SERRATUS, in anatomy, a name given to several muscles, from their resemblance to a saw. See ANATOMY, *Table of the Muscles.*

SERTORIUS (Quintus), an eminent Roman general. See SPAIN; under the history of which his exploits are related.

SERTULARIA, in natural history, a genus belonging to the class of vermes, and to the order of zoophyta. The stem is radicated, fibrous, naked, and jointed; the florets are hydræ, and there is one at each joint. This genus comprehends 42 species of corallines.

SERVAL, mountain cat. See FELIS, xvi.

SERVANDONI (John Nicolas), was born at Florence in 1695. He rendered himself famous by his exquisite taste in architecture, and by his genius for decorations, fetes, and buildings. He was employed and rewarded by most of the princes in Europe. He was honoured in Portugal with the order of Christ: In France he was architect and painter to the king, and member of the different academies established for the advancement of these arts. He received the same titles from the kings of Britain, Spain, Poland, and from the duke of Wirtemberg. Notwithstanding these advantages, his want of economy was so great, that he left nothing behind him. He died at Paris in 1766. Paris is indebted to him for many of its ornaments. He made decorations for the theatres of London and Dresden. The French king's theatre, called *la salle des Machines*, was under his management for some time. He was permitted to exhibit shows consisting of simple decorations: Some of these were astonishingly sublime; his "Descent of Æneas into Hell" in particular, and his "Enchanted Forest," are well known. He built and embellished a theatre at Chambord for Mareschal Saxe; and furnished the plan and the model of the theatre royal at Dresden. His genius for fetes was remarkable; he had the management of a great number in Paris, and even London. He conducted one at Lisbon given on account of a victory gained by the duke of Cumberland. He was employed frequently by the king of Portugal,

Servant.

Portugal, to whom he presented several elegant plans and models. The prince of Wales, too, father to the present king, engaged him in his service; but the death of that prince prevented the execution of the designs which had been projected. He presided at the magnificent *fête* given at Vienna on account of the marriage of the archduke Joseph and the infanta of Parma. But it would be endless to attempt an enumeration of all his performances and exhibitions.

SERVANT, a term of relation, signifying a person who owes and pays obedience for a certain time to another in quality of a master.

As to the several sorts of servants: It was observed under the article LIBERTY, that pure and proper slavery does not, nay, cannot, subsist in Britain, such we mean whereby an absolute and unlimited power is given to the master over the life and fortune of the slave. And indeed it is repugnant to reason, and the principles of natural law, that such a state should subsist anywhere. See SLAVERY.

The law of England therefore abhors, and will not endure the existence of slavery within this nation; so that when an attempt was made to introduce it, by statute 1 Edw. VI. c. 3. which ordained, that all idle vagabonds should be made slaves, and fed upon bread, water, or small drink, and refuse meat; should wear a ring of iron round their necks, arms, or legs; and should be compelled, by beating, chaining, or otherwise, to perform the work assigned them, were it ever so vile: the spirit of the nation could not brook this condition, even in the most abandoned rogues; and therefore this statute was repealed in two years afterwards. And now it is laid down, that a slave or negro, the instant he lands in Britain, becomes a free man; that is, the law will protect him in the enjoyment of his person and his property. Yet, with regard to any right which the master may have lawfully acquired to the perpetual service of John or Thomas, this will remain exactly in the same state as before: for this is no more than the same state of subjection for life which every apprentice submits to for the space of seven years or sometimes for a longer term. Hence, too, it follows, that the infamous and unchristian practice of withholding baptism from negro servants, lest they should thereby gain their liberty, is totally without foundation, as well as without excuse. The law of England acts upon general and extensive principles; it gives liberty, rightly understood, that is, protection to a Jew, a Turk, or a Heathen, as well as to those who profess the true religion of Christ; and it will not dissolve a civil obligation between master and servant, on account of the alteration of faith in either of the parties; but the slave is entitled to the same protection in England before as after baptism; and, whatever service the Heathen negro owed of right to his American master by general, not by local law, the same (whatever it be) is he bound to render when brought to England and made a Christian.

1. The first sort of servants, therefore acknowledged by the laws of England are *menial servants*; so called from being *intra mœnia*, or domestics. The contract between them and their masters, rises upon the hiring. If the hiring be general, without any particular time limited, the law construes it to be a hiring for a year: upon a principle of natural equity, that the servant shall serve, and the master maintain him, throughout all the revolutions of the respective seasons; as well when there is work to be done, as when there is not: but the contract may be made for any larger or smaller term. All single men between 12 years old and 60, and married ones under 30 years of age, and all single women between 12 and 40, not having any visible livelihood, are compellable by two justices to go out to service in husbandry or certain specific trades, for the promotion of honest industry; and no master can put away his servant, or servant leave his master, after being so retained either before or at the end of his term, without a quarter's warning; unless upon reasonable cause, to be allowed by a justice of the peace: but they may part by consent, or make a special bargain.

2. Another species of servants are called *apprentices* (from *apprendre*, to learn); and are usually bound for a term of years, by deed indented or indentures, to serve their masters, and be maintained and instructed by them. This is usually done to persons of trade, in order to learn their art and mystery; and sometimes very large sums are given with them as a premium for such their instruction: but it may be done to husbandmen, nay to gentlemen and others. And children of poor persons may be apprenticed out by the overseers, with consent of two justices, till 24 years of age, to such persons as are thought fitting; who are also compellable to take them; and it is held that gentlemen of fortune, and clergymen, are equally liable with others to such compulsion: for such purposes our statutes have made the indentures obligatory, even though such parish-apprentice be a minor. Apprentices to trades may be discharged on reasonable cause, either at the request of themselves or masters at the quarter-sessions, or by one justice, with appeal to the sessions; who may, by the equity of the statute, if they think it reasonable, direct restitution of a rateable share of the money given to the apprentice: and parish apprentices may be discharged in the same manner by two justices. But if an apprentice, with whom less than 10 pounds hath been given, runs away from his master, he is compellable to serve out his time of absence, or make satisfaction for the same, at any time within seven years after the expiration of his original contract. See APPRENTICE and APPRENTICESHIP.

3 A third species of servants are *labourers*, who are only hired by the day or the week, and do not live *intra mœnia*, as part of the family; concerning whom the statutes before cited have made many very good regulations: 1. Directing that all persons who have no visible effects may be compelled to work: 2. Defining how long they must continue to work in summer and in winter: 3. Punishing such as leave or desert their work: 4. Empowering the justices at sessions, or the sheriff of the county, to settle their wages: and, 5. Inflicting penalties on such as either give or exact more wages than are so settled.

4. There is yet a fourth species of servants, if they may be so called, being rather in a superior, a ministerial capacity; such as *stewards*, *factors*, and *bailiffs*; whom, however, the law considers as servants *pro tempore*, with regard to such of their acts as affect their master's or employer's property.

As to the manner in which this relation affects the master, the servant himself, or third parties, see the article *MASTER and Servant*.

Servetists, Servetus.

For the condition of servants by the law of Scotland, see LAW.

SERVETISTS, a name given to the modern Antitrinitarians, from their being supposed to be the followers of Michael Servetus; who, in the year 1553, was burnt at Geneva, together with his books.

SERVETUS (Michael), a learned Spanish physician, was born at Villaneuva, in Arragon, in 1509. He was sent to the university of Toulouse to study the civil law. The Reformation, which had awakened the most polished nations of Europe, directed the attention of thinking men to the errors of the Romish church and to the study of the Scriptures. Among the rest Servetus applied to this study. From the love of novelty, or the love of truth, he carried his inquiries far beyond the other reformers, and not only renounced the false opinions of the Roman Catholics, but went so far as to question the doctrine of the Trinity. Accordingly, after spending two or three years at Toulouse, he determined to go into Germany to propagate his new opinions, where he could do it with most safety. At Basil he had some conferences with Oecolampadius. He went next to Strasburg to visit Bucer and Capito, two eminent reformers of that town. From Strasburg he went to Hagenau, where he printed a book, entitled *De Trinitatis Erroribus*, in 1531. The ensuing year he published two other treatises on the same subject: in an advertisement to which, he informs the reader that it was not his intention to retract any of his former sentiments, but only to state them in a more distinct and accurate manner. To these two publications he had the courage to put his name, not suspecting that in an age when liberty of opinion was granted, the exercise of that liberty would be attended with danger. After publishing these books, he left Germany, probably finding his doctrines not so cordially received as he expected. He went first to Basil, and thence to Lyons, where he lived two or three years. He then removed to Paris, where he studied medicine under Sylvius, Fernelius, and other professors, and obtained the degree of master of arts and doctor of medicine. His love of controversy involved him in a serious dispute with the physicians of Paris; and he wrote an Apology, which was suppressed by an edict of the parliament. The misunderstanding which this dispute produced with his colleagues, and the chagrin which so unfavourable a termination occasioned, made him leave Paris in disgust. He settled two or three years in Lyons, and engaged with the Frellons, eminent printers of that age, as a corrector to their press. At Lyons he met with Pierre Palmier, the archbishop of Vienne, with whom he had been acquainted at Paris. That prelate, who was a great encourager of learned men, pressed him to accompany him to Vienne, offering him at the same time an apartment in his palace. Servetus accepted the offer, and might have lived a tranquil and happy life at Vienne, if he could have confined his attention to medicine and literature. But the love of controversy, and an eagerness to establish his opinions, always possessed him. At this time Calvin was at the head of the reformed church at Geneva. With Servetus he had been acquainted at Paris, and had there opposed his opinions. For 16 years Calvin kept up a correspondence with him, endeavouring to reclaim him from his errors. Servetus had read the works of Calvin, but did not think they merited the high eulogies of the reformers, nor were they sufficient to convince him of his errors. He continued, however, to consult him; and for this purpose sent from Lyons to Geneva three questions which respected the divinity of Jesus Christ, regeneration, and the necessity of baptism. To these Calvin returned a civil answer. Servetus treated the answer with contempt, and Calvin replied with warmth. From reasoning he had recourse to abusive language; and this produced a polemical hatred, the most implacable disposition in the world. Calvin having obtained some of Servetus's papers, by means, it is said, not very honourable, sent them to Vienne along with the private letters which he had received in the course of their correspondence. The consequence was, that Servetus was arrested; but having escaped from prison, he resolved to retire to Naples, where he hoped to practice medicine with the same reputation which he had so long enjoyed at Vienne. He imprudently took his route through Geneva, though he could not but know that Calvin was his mortal enemy. Calvin informed the magistrates of his arrival; Servetus was apprehended, and appointed to stand trial for heresy and blasphemy. It was a law at Geneva, that every accuser should surrender himself a prisoner, that if the charge should be found false, the accuser should suffer the punishment in which he meant to involve the accused. Calvin not choosing to go to prison himself, sent one of his domestics to present the impeachment against Servetus. The articles brought against him were collected from his writings with great care; an employment which took up three days. One of these articles was, "that Servetus had denied that Judæa was a beautiful, rich, and fertile country; and affirmed, on the authority of travellers, that it was poor, barren, and disagreeable." He was also charged with "corrupting the Latin Bible, which he was employed to correct at Lyons, by introducing impertinent, trifling, whimsical, and impious notes of his own through every page." But the main article, which was certainly fatal to him, was, "that in the person of Mr Calvin, minister of the word of God in the church of Geneva, he had defamed the doctrine that is preached, uttering all imaginable injurious, blasphemous words against it."

Calvin visited Servetus in prison, and had frequent conferences with him; but finding that, in opposition to all the arguments he could employ, the prisoner remained inflexible in his opinions, he left him to his fate. Before sentence was passed, the magistrates of Geneva consulted the ministers of Bale, of Bern, and Zurich; and, as another account informs us, the magistrates of the Protestant cantons of Switzerland. And to enable them to form a judgment of the criminality of Servetus, they transmitted the writings of Calvin, with his answers. The general opinion was, that Servetus ought to be condemned to death for blasphemy. He was accordingly sentenced to be burnt alive on the 27th of October 1553. As he continued alive in the midst of the flames more than two hours, it is said, finding his torment thus protracted, he exclaimed, "Unhappy wretch that I am! Will the flames be insufficient to terminate my misery! What then! Will the hundred pieces of gold, and the rich collar which they took from me, not purchase wood enough to consume me more quickly!" Though the sentence of death was passed against Servetus by the magistrates of Geneva, with the approbation

etus approbation of a great number of the magistrates and ministers of Switzerland, yet it is the opinion of most historians that this dreadful sentence was imposed at the instigation of Calvin. This act of severity for holding a speculative opinion, however erroneous and absurd, has left a stain on the character of this illustrious reformer, which will attend the name of Calvin as long as history shall preserve it from oblivion. The address and art which he used in apprehending Servetus, his inhumanity to him during his trial, his dissimulation and malevolence after his condemnation, prove that he was as much influenced by personal hatred as by a desire to support the interest of religion, though probably, during the trial, Calvin believed he was performing a very pious action. This intolerant spirit of Calvin and the magistrates of Geneva gave the Roman Catholics a favourable opportunity to accuse the Protestants of inconsistency in their principles, which they did not fail to embrace. "How could the magistrates (says the author of the *Dictionnaire des Heresies*), who acknowledge no infallible interpretation of the Scriptures, condemn Servetus to death because he explained them differently from Calvin; since every man has the privilege to expound the Scriptures according to his own judgment, without having recourse to the church? It is a great injustice to condemn a man because he will not submit to the judgment of an enthusiast, who may be wrong as well as himself."

ice.

Servetus was a man of great acuteness and learning, and well versed in the arts and sciences. In his own profession his genius exerted itself with success. In his tract entitled *Christianismi Restitutio*, published in 1553, he remarks, that the whole mass of blood passes through the lungs by the pulmonary artery and vein, in opposition to the opinion which was then universally entertained, that the blood passes through the partition which divides the two ventricles. This was an important step towards the discovery of the circulation of the blood.

His works consist of Controversial Writings concerning the Trinity; an edition of Paguinus's Version of the Bible, with a preface and notes, published under the name of Michael Villanevanus; an Apology to the Physicians of Paris; and a book entitled *Ratio Syruporum*. Mosheim has written in Latin a History of the Heresy and Misfortunes of Servetus, which was published at Helmstadt, in 4to, in 1728. From the curious details which it gives it is extremely interesting.

SERVIA, a province of Turkey in Europe, bounded on the north by the rivers Danube and Save, which separate it from Hungary; on the east, by Bulgaria; on the west, by Bosnia; and on the south, by Albania and Macedonia. It is about 190 miles in length from east to west; 95 in breadth from north to south; and is divided into four sangiacates. Two of these were ceded to the Christians in 1718, who united them into one. This continued till 1739, when the Turks were victorious; and then they were abandoned to the Turks by the treaty of Belgrade. Belgrade is the capital town.

SERVICE, in law, is a duty which a tenant, on account of his fee, owes to his lord.

There are many divisions of services; as, 1. Into personal, where something is to be done by the tenant in person, as homage and fealty. 2. Real, such as wards, marriages, &c. 3. Accidental, including heriots, reliefs, and the like. 4. Entire, where, on the alienation of any part of the lands by a tenant, the services become multiplied. 5. Frank-service, which was performed by freemen, who were not obliged to perform any base service, but only to find a man and horse to attend the lord into the army or to court. 6. Knight's service, by which lands were anciently held of the king, on paying homage, service in war, &c. Service.

As in every free and well regulated society there must be a diversity of ranks, there must be a great number of persons employed in service, both in agriculture and domestic affairs. In this country, service is a contract into which the servant voluntarily enters; and the master's authority extends no farther than to the performance of that species of labour for which the agreement was made.

"The treatment of servants (says that respectable moralist Mr Paley), as to diet, discipline, and accommodation, the kind and quantity of work to be required of them, the intermission, liberty, and indulgence to be allowed them, must be determined in a great measure by custom; for where the contract involves so many particulars, the contracting parties express a few perhaps of the principal, and by mutual understanding refer the rest to the known custom of the country in like cases. *Paley's Moral and Political Philosophy, p. 2[illegible]9.*

"A servant is not bound to obey the unlawful commands of his master; to minister, for instance, to his unlawful pleasures; or to assist him in unlawful practices in his profession; as in smuggling or adulterating the articles which he deals in. For the servant is bound by nothing but his own promise; and the obligation of a promise extends not to things unlawful.

"For the same reason, the master's authority does not justify the servant in doing wrong; for the servant's own promise, upon which that authority is founded, would be none.

"Clerks and apprentices ought to be employed entirely in the profession or trade which they are intended to learn. Instruction is their wages; and to deprive them of the opportunities of instruction, by taking up their time with occupations foreign to their business, is to defraud them of their wages.

"The master is responsible for what a servant does in the ordinary course of his employment; for it is done under a general authority committed to him, which is in justice equivalent to a specific direction. Thus, if I pay money to a banker's clerk, the banker is accountable: but not if I had paid it to his butler or his footman, whose business it is not to receive money. Upon the same principle, if I once send a servant to take up goods upon credit, whatever goods he afterwards takes up at the same shop, so long as he continues in my service, are justly chargeable to my account.

"The law of this country goes great lengths in intending a kind of concurrence in the master, so as to charge him with the consequences of his servant's conduct. If an innkeeper's servant rob his guests, the innkeeper must make restitution; if a farrier's servant lame your horse, the farrier must answer for the damage; and still farther, if your coachman or carter drive over a passenger in the road, the passenger may recover from you a satisfaction for the hurt he suffers. But these determinations stand, I think, rather upon the authority of the law, than any principle of natural justice."

There is a grievance which has long and justly been

Service. been complained of, the giving of good characters to bad servants. This is perhaps owing to carelessness, to a desire of getting rid of a bad servant, or to mistaken compassion. But such carelessness is inexcusable. When a man gives his sanction to the character of a bad servant, he ought to reflect on the nature and consequences of what he is doing. He is giving his name to a falsehood; he is deceiving the honest man who confides in his veracity; and he is deliberately giving a knave an opportunity of cheating an honest man. To endeavour to get quit of a bad servant in this way, is surely not less criminal than concealing the faults and disadvantages of an estate which is advertised for sale, and ascribing to it advantages which it does not possess. In this case, we know the sale would be reduced, and the advertiser disgraced. Many masters give characters to servants out of compassion; but it is to this mistaken compassion that the disorderly behaviour of servants is perhaps principally owing: for if the punishment of dishonesty be only a change of place (which may be a reward instead of a punishment), it ceases to be a servant's interest to be true to his trust.

We have said above that a master's authority over his servant extends no farther than the terms of contract; by which we meant, that a master could give no unreasonable orders to his servant, or such as were inconsistent with the terms of contract. But the relation between a master and servant is certainly closer than the mere terms of a contract: it is a moral as well as a legal relation. A master of a family ought to superintend the morals of his servants, and to restrain them from vices. This he may do by his example, by his influence, and authority. Indeed every man possessed of authority is guilty of criminal negligence if he does not exert his authority for promoting virtue in his inferiors; and no authority is so well adapted for this purpose as that of masters of families, because none operates with an influence so immediate and constant. It is wonderful how much good a nobleman or gentleman of fortune can do to his domestics by attending to their morals; and every master may be a blessing to individuals and to society, by exerting prudently that influence which his situation gives him over the conduct of his servant.

Choral SERVICE, in church history, denotes that part of religious worship which consists in chanting and singing. The advocates for the high antiquity of singing, as a part of church music, urge the authority of St Paul in its favour (Ephes. chap. v. ver. 19. and Coloss. chap. iii. ver. 16.) On the authority of which passages it is asserted, that songs and hymns were, from the establishment of the church, sung in the assemblies of the faithful; and it appears from undoubted testimony, that singing, which was practised as a sacred rite among the Egyptians and Hebrews, at a very early period, and which likewise constituted a considerable part of the religious ceremonies of the Greeks and Romans, made a part of the religious worship of Christians, not only before churches were built, and their religion established by law, but from the first profession of Christianity. However, the era from whence others have dated the introduction of music into the service of the church, is that period during which Leontius governed the church of Antioch, *i.e.* between the year of Christ 347 and 356. See ANTIPHONY.

From Antioch the practice soon spread through the other churches of the East; and in a few ages after its first introduction into the divine service, it not only received the sanction of public authority, but those were forbid to join in it who were ignorant of music. A canon to this purpose was made by the council of Laodicea, which was held about the year 372; and Zonaras informs us, that these canonical singers were reckoned a part of the clergy. Singing was introduced into the western churches by St Ambrose about the year 374, who was the institutor of the Ambrosian chant established at Milan about the year 386; and Eusebius (Lib. II. cap. 17.) tells us, that a regular choir, and method of singing the service, were first established, and hymns used, in the church at Antioch during the reign of Constantine, and that St Ambrose, who had long resided there, had his melodies thence. This was about 230 years afterwards amended by Pope Gregory the Great, who established the Gregorian chant; a plain, unisonous kind of melody, which he thought consistent with the gravity and dignity of the service to which it was to be applied. This prevails in the Roman church even at this day: it is known in Italy by the name of *canto fermo*; in France by that of *plain chant*; and in Germany and most other countries by that of *cantus Gregorianus*. Although no satisfactory account has been given of the specific difference between the Ambrosian and Gregorian chants, yet all writers on this subject agree in saying, that St Ambrose only used the four authentic modes, and that the four plagal were afterwards added by St Gregory. Each of these had the same final, or key-note, as its relative authentic; from which there is no other difference, than that the melodies in the four authentic or principal modes are generally confined within the compass of the eight notes above the key-note, and those in the four plagal or relative modes, within the compass of the eight notes below the fifth of the key. See MODE.

Ecclesiastical writers seem unanimous in allowing that Pope Gregory, who began his pontificate in 590, collected the musical fragments of such ancient psalms and hymns as the first fathers of the church had approved and recommended to the first Christians; and that he selected, methodized, and arranged them in the order which was long continued at Rome, and soon adopted by the chief part of the western church. Gregory is also said to have banished from the church the *canto figurato*, as too light and dissolute; and it is added, that his own chant was called *canto fermo*, from its gravity and simplicity.

It has been long a received opinion, that the ecclesiastical tones were taken from the reformed modes of Ptolemy; but Dr Burney observes, that it is difficult to discover any connexion between them, except in their names; for their number, upon examination, is not the same; those of Ptolemy being seven, the ecclesiastical eight; and indeed the Greek names given to the ecclesiastical modes do not agree with those of Ptolemy in the single instance of key, but with those of higher antiquity. From the time of Gregory to that of Guido, there was no other distinction of keys than that of authentic and plagal; nor were any semitones used but those from E to F, B to C, and occasionally A to B *b*.

With respect to the music of the primitive church, it may

may be observed, that though it consisted in the singing of psalms and hymns, yet it was performed in many different ways; sometimes the psalms were sung by one person alone, whilst the rest attended in silence; sometimes they were sung by the whole assembly; sometimes alternately, the congregation being divided into separate choirs; and sometimes by one person, who repeated the first part of the verse, the rest joining in the close of it. Of the four different methods of singing now recited, the second and third were properly distinguished by the names of *symphony* and *antiphony*; and the latter was sometimes called *responsaria*, in which women were allowed to join. St Ignatius, who, according to Socrates (Lib. VI. cap. 8.), conversed with the apostles, is generally supposed to have been the first who suggested to the primitive Christians in the East the method of singing hymns and psalms alternately, or in dialogue; and the custom soon prevailed in every place where Christianity was established; though Theodoret in his history (Lib. II. cap. 24) tells us, that this manner of singing was first practised at Antioch. It likewise appears, that almost from the time when music was first introduced into the service of the church, it was of two kinds, and consisted in a gentle inflection of the voice, which they termed plain song, and a more elaborate and artificial kind of music, adapted to the hymns and solemn offices contained in its ritual: and this distinction has been maintained even to the present day.

Although we find a very early distinction made between the manner of singing the hymns and chanting the psalms, it is, however, the opinion of the learned Martini, that the music of the first five or six ages of the church consisted chiefly in a plain and simple chant of unisons and octaves, of which many fragments are still remaining in the *canto fermo* of the Romish missals. For with respect to music in parts, as it does not appear, in these early ages, that either the Greeks or Romans were in possession of harmony or counterpoint, which has been generally ascribed to Guido, a monk of Arezzo in Tuscany, about the year 1022, though others have traced the origin of it to the eighth century, it is in vain to seek it in the church. The choral music, which had its rise in the church of Antioch, and from thence spread through Greece, Italy, France, Spain, and Germany, was brought into Britain by the singers who accompanied Austin the monk, when he came over, in the year 596, charged with a commission to convert the inhabitants of this country to Christianity. Bede tells us, that when Austin and the companions of his mission had their first audience of King Ethelbert, in the isle of Thanet, they approached him in procession, singing litanies; and that afterwards, when they entered the city of Canterbury, they sung a litany, and at the end of it Allelujah. But though this was the first time the Anglo-Saxons had heard the Gregorian chant, yet Bede likewise tells us, that our British ancestors had been instructed in the rites and ceremonies of the Gallican church by St Germanus, and heard him sing Allelujah many years before the arrival of St Austin. In 680, John, precentor of St Peter's in Rome, was sent over by Pope Agatho to instruct the monks of Weremouth in the art of singing; and he was prevailed upon to open schools for teaching music in other places in Northumberland. Benedict Biscop, the preceptor of Bede, Adrian the monk, and many others, contributed to disseminate the knowledge of the Roman chant. At length the successors of St Gregory, and of Austin his missionary, having established a school for ecclesiastical music at Canterbury, the rest of the island was furnished with masters from that seminary. The choral service was first introduced in the cathedral church of Canterbury; and till the arrival of Theodore, and his settlement in that see, the practice of it seems to have been confined to the churches of Kent; but after that, it spread over the whole kingdom; and we meet with records of very ample endowments for the support of this part of public worship. This mode of religious worship prevailed in all the European churches till the time of the Reformation: the first deviation from it is that which followed the Reformation by Luther, who, being himself a lover of music, formed a liturgy, which was a musical service, contained in a work entitled *Psalmodia, h. e. Cantica sacra Veteris Ecclesiæ selecta*, printed at Norimberg in 1553, and at Wittemberg in 1561. But Calvin, in his establishment of a church in Geneva, reduced the whole of divine service to prayer, preaching, and singing; the latter of which he restrained. He excluded the offices of the antiphon, hymn, and motet, of the Romish service, with that artificial and elaborate music to which they were sung; and adopted only that plain metrical psalmody, which is now in general use among the reformed churches, and in the parochial churches of our own country. For this purpose he made use of Marot's version of the Psalms, and employed a musician to set them to easy tunes only of one part. In 1553, he divided the Psalms into pauses or small portions, and appointed them to be sung in churches. Soon after they were bound up with the Geneva catechism; from which time the Catholics, who had been accustomed to sing them, were forbid the use of them, under a severe penalty. Soon after the Reformation commenced in England, complaints were made by many of the dignified clergy and others of the intricacy and difficulty of the church music of those times: in consequence of which it was once proposed, that organs and curious singing should be removed from our churches. Latimer, in his diocese of Worcester, went still farther, and issued injunctions to the prior and convent of St Mary, forbidding in their service all manner of singing. In the reign of Edward VI. a commission was granted to eight bishops, eight divines, eight civilians, and eight common lawyers, to compile a body of such ecclesiastical laws as should in future be observed throughout the realm. The result of this commission was a work first published by Fox the martyrologist, in 1571, and afterwards in 1640, under the title of *Reformatio Legum Ecclesiasticarum*. These 32 commissioners, instead of reprobating church-music, merely condemned figurative and operose music, or that kind of singing which abounded with fugues, responsive passages, and a commixture of various and intricate proportions; which, whether extemporary or written, is by musicians termed *descant*. However, notwithstanding the objections against choral music, and the practice of some of the reformed churches, the compilers of the English liturgy in 1548, and the king himself, determined to retain musical service. Accordingly the statute 2 and 3 Edw. VI. cap. 1. though it contains no formal obligation on the clergy, or others, to use or join in either vocal or instrumental music in the common prayer, does clearly recognize the practise of singing; and

and in less than two years after the compiling of King Edward's liturgy, a formula was composed, which continues, with scarce any variation, to be the rule for choral service even at this day. The author of this work was John Marbecke, or Marbeike; and it was printed by Richard Grafton, in 1550, under the title of the Book of Common Prayer, noted. Queen Mary laboured to re establish the Romish choral service; but the accession of Elizabeth was followed by the act of uniformity; in consequence of which, and of the queen's injunctions, the Book of Common Prayer, noted by Marbeke, was considered as the general formula of choral service. In 1560, another musical service, with some additions and improvements, was printed by John Day; and in 1565, another collection of offices, with musical notes. Many objections were urged by Cartwright and other Puritans against the form and manner of cathedral service, to which Hooker replied in his Ecclesiastical Polity. In 1664, the statutes of Edward VI. and Elizabeth, for uniformity in the Common Prayer, were repealed; and the Directory for Public Worship, which allows only of the singing of psalms, established. But upon the restoration of Charles II. choral service was again revived, and has since uniformly continued. See on this subject Hawkins's History of Music. Vol. I. p. 404. Vol. II. p. 264. Vol. III. p. 58—468, &c. Vol. IV. p. 44—347.

Service Tree. See Sorbus.

SERVITES, a religious order in the church of Rome, founded about the year 1233, by seven Florentine merchants, who, with the approbation of the bishop of Florence, renounced the world, and lived together in a religious community on Mount Senar, two leagues from that city.

SERVITOR, in the university of Oxford, a student who attends on another for his maintenance and learning. See Sizar.

SERVITUDE, the condition of a servant, or rather slave.

Under the declension of the Roman empire, a new kind of servitude was introduced, different from that of the ancient Romans: it consisted in leaving the lands of subjugated nations to the first owners, upon condition of certain rents, and servile offices, to be paid in acknowledgement. Hence the name of *servi censiti, adscriptitii*, and *addicti glebæ*; some whereof were taxable at the reasonable discretion of the lord; others at a certain rate agreed on; and others were mainmortable, who, having no legitimate children, could not make a will to above the value of five pence, the lord being heir of all the rest; and others were prohibited marrying, or going to live out of the lordship. Most of these services existed lately in France; but they were long ago abolished in England. Such, however, was the original of our tenures, &c. See Slave.

Servitude, in Scots law. See Law, Part III. Sect. ix.

SERVIUS (Maurus Honoratus), a celebrated grammarian and critic of antiquity, who flourished about the time of Arcadius and Honorius; now chiefly known by his Commentaries on Virgil. There is also extant a piece of Servius upon the feet of verses and the quantity of syllables, called *Centimetrum*.

SERUM, a thin, transparent, saltish liquor, which makes a considerable part of the mass of blood. See Anatomy, N° 126. and Blood.

SESAMOIDEA ossa, certain small bones somewhat resembling the seeds of sesamum, whence their name. They are placed at the under part of the bones of the last joints of the fingers and toes.

SESAMUM, oily grain, in botany: A genus of plants belonging to the class of didynamia, and to the order of angiospermia; and in the natural system ranging under the 20th order, *Luridæ*. The calyx is divided into five parts. The corolla is campanulated, the tube of which is nearly the length of the calyx; the throat is inflated, and very large; the border is divided into five parts, four of which are spreading and nearly equal; the fifth is the lowest and largest. There are four filaments, and the rudiments of a fifth. The stigma is lanceolated, and the capsule has four cells. There are only two species, the *oriental* and *indicum*. 1. The oriental has ovate, oblong, entire leaves. It is an annual, and grows naturally on the coast of Malabar and in the island of Ceylon; rising with an herbaceous four-cornered stalk, two feet high, sending out a few short side-branches; the leaves are oblong, oval, a little hairy, and stand opposite. The flowers terminate the stalks in loose spikes; they are small, of a dirty white colour, shaped somewhat like those of the fox-glove. After the flowers are past, the germen turns to an oval acute-pointed capsule with four cells, filled with oval compressed seeds, which ripen in autumn. 2. The indicum, with trifid lower leaves, grows naturally in India: this is also an annual plant; the stalk rises taller than that of the former; the lower leaves are cut into three parts, which is the only difference between them.

The first sort is frequently cultivated in all the eastern countries, and also in Africa, as a pulse; and of late years the seeds have been introduced into Carolina by the African negroes, where they succeed extremely well. The inhabitants of that country make an oil from the seed, which will keep good many years, without having any rancid smell or taste, but in two years become quite mild; so that when the warm taste of the seed, which is in the oil when first drawn, is worn off, they use it as salad-oil, and for all the purposes of sweet oil. The seeds of this plant are also used by the negroes for food which seeds they parch over the fire, and then mix them with water, and stew other ingredients with them, which makes a hearty food. Sometimes a sort of pudding is made of these seeds, in the same manner as with millet or rice, and is by some persons esteemed, but is rarely used for these purposes in Europe. This is called *benny* or *bonny* in Carolina. In England these plants are preserved in botanic gardens as curiosities. Their seeds must be sown in the spring upon a hot-bed; and when the plants are come up, they must be transplanted into a fresh hot-bed to bring them forward. After they have acquired a tolerable degree of strength, they should be planted into pots, and plunged into another hot-bed, managing them as hath been directed for amaranths; for if these plants are not thus brought forward in the former part of the summer, they will not produce good seeds in this country.

From nine pounds of this seed which came from Carolina,

rolina, there were upwards of two quarts of oil drawn, which is as great a quantity as hath been obtained from any vegetable whatever. This might occasion its being called the *oily grain*.

SESELI, MEADOW SAXIFRAGE, in botany: A genus of plants belonging to the class of pentandria, and to the order of digynia; and in the natural system ranging under 45th order, *Umbellatæ*. The umbels are globular; the involucrum consists of one or two leaflets: the fruit is egg-shaped and streaked. There are 11 species, the *pimpinelloides, montanum, glaucum, annuum, ammoides, tortuosum, turbith, hyppomarathrum pyreneum, saxifragum*, and *elatum*. The montanum grows naturally in France and Italy; the glaucum is a native of France; the ammoides and tortuosum grow in the south of Europe; and the hyppomarathrum is a native of Austria.

SESOSTRIS, king of Egypt. See EGYPT, p. 368.

SESQUI, a Latin particle, signifying a whole and a half; which joined with *altera, terza, quarta*, &c, is much used in the Italian music to express a kind of ratios, particularly several species of triples.

Sesqui-Alterate, in geometry or arithmetic, is a ratio between two lines, two numbers, or the like, where one of them contains the other once, with the addition of a half.

Thus 6 and 9 are in a sesqui-alterate ratio; since 9 contains 6 once, and 3, which is half of 6, over; and 20 and 30 are in the same; as 30 contains 20, and half 20 or 10.

Sesqui-Duplicate ratio, is when two of terms the greater contains the less twice, and half the less remains; as 15 and 6; 50 and 20.

Sesqui-Tertional proportion, is when any number or quantity contains another once and one third.

SESSILE, among botanists. See BOTANY.

SESSION, in general, denotes each sitting or assembly of a council, &c.

Session of Parliament, is the season or space from its meeting to its propagation. See PARLIAMENT.

Kirk Session, the name of a petty ecclesiastical court in Scotland. See *Kirk-Session*.

SESSIONS for weights and measures. In London, four justices from among the mayor, recorder, and aldermen (of whom the mayor or recorder is to be one), may hold a session to inquire into the offences of selling by false weights and measures, contrary to the statutes; and to receive indictments, punish offenders, &c. Char. King Charles I.

Court of Session. See LAW, Part III. Sect. II.

Court of Quarter Sessions, an English court that must be held in every county once in every quarter of a year; which, by statute 2 Hen. V. c. 4. is appointed to be in the first week after Michaelmas day, the first week after the Epiphany, the first week after the close of Easter, and in the week after the translation of St Thomas the martyr, or the 7th of July. It is held before two or more justices of the peace, one of which must be of the quorum. The jurisdiction of this court, by 34. Edw. III. c. 1. extends to the trying and determining all felonies and trespasses whatsoever: though they seldom, if ever, try any greater offence than small felonies within the benefit of clergy; their commission providing, that if any case of difficulty arises, they shall not proceed to judgment, but in the presence of one of the justices of the courts of king's-bench or common pleas, or one of the judges of assize: and therefore murders, and other capital felonies, are usually remitted for a more solemn trial to the assizes. They cannot also try any new created offence, without express power given them by the statute which creates it. But there are many offences and particular matters which, by particular statutes, belong properly to this jurisdiction, and ought to be prosecuted in this court; as, the smaller misdemeanors against the public or commonwealth, not amounting to felony; and especially offences relating to the game, highways, alehouses, bastard children, the settlement and provision for the poor, vagrants, servants wages, and Popish recusants. Some of these are proceeded upon by indictment: others in a summary way, by motion, and order thereupon; which order may for the most part, unless guarded against by particular statutes, be removed into the court of king's-bench by writ of *certiorari facias*, and be there either quashed or confirmed. The records or rolls of the sessions are committed to the custody of a special officer, denominated *custos rotulorum*, who is always a justice of the quorum; and among them of the quorum (saith Lambard) a man for the most part especially picked out, either for wisdom, countenance, or credit. The nomination of the *custos rotulorum* (who is the principal officer in the country, as the lord-lieutenant is chief in military command) is by the king's sign-manual: and to him the nomination of the clerk of the peace belongs; which office be is expressly forbidden to sell for money.

In most corporation-towns there are quarter-sessions kept before justices of their own, within their respective limits; which have exactly the same authority as the general quarter-sessions of the county, except in a very few instances; one of the most considerable of which is the matter of appeals from orders of removal of the poor, which though they be from the orders of corporation-justices, must be to the sessions of the county, by statutes 8 and 9 W. III. c. 30. In both corporations and counties at large, there is sometimes kept a special or petty session, by a few justices, for despatching smaller business in the neighbourhood between the times of the general sessions; as for licensing alehouses, passing the account of parish-officers, and the like.

SESTERCE, SESTERTIUS a silver coin, in use among the ancient Romans, called also simply *nummus*, and sometimes *nummus sestertius*. The sestertius was the fourth part of the denarius, and originally contained two asses and a half. It was at first denoted by LLS; the two L's signifying two libræ, and the S half. But the librarii, afterwards converting the two L's into an H, expressed the sestertius by HS. The word *sestertius* was first introduced by way of abbreviation for *semistertius*, which signifies two, and a half of a third, or, literally, only half a third; for in expressing half a third, it was understood that there were two before.

Some authors make two kinds of sesterces; the less called *sestertius* in the masculine gender; and the great one, called *sestertium*, in the neuter: the first, that we have already described; the latter containing a thousand of the other. Others will have any such distinction of great and little sesterces unknown to the Romans: *sestertius* say they, was an adjective, and signified *as sestertius*;

Sesterce. *tius*, or two asses and a half; and when used in the plural, as in *quinquaginta sestertium*, or *sestertia*, it was only by way of abbreviation, and there was always understood *centena*, *millia*, &c.*

This matter has been accurately stated by Mr Raper, in the following manner. The substantive to which sestertius referred is either *as*, or *pondus*; and *sestertius as* is two asses and a half; *sestertium pondus*, two pondera and a half, or two hundred and fifty denarii. When the denarius passes for ten asses, the sestertius of two asses and a half was a quarter of it; and the Romans continued to keep their accounts in these sesterces long after the denarius passed for sixteen asses; till, growing rich, they found it more convenient to reckon by quarters of the denarius, which they called *nummi*, and used the words *nummus* and *sestertius* indifferently, as synonymous terms, and sometimes both together, as *sestertius nummus*; in which case the word *sestertius*, having lost its original signification, was used as a substantive; for *sestertius nummus* was not two nummi and a half, but a single nummus of four asses. They called any sum under two thousand sesterces so many *sestertii* in the masculine gender; two thousand sesterces they called *duo* or *bina sestertia*, in the neuter; so many quarters making five hundred denarii, which was twice the sestertium; and they said *dena*, *vicena*, &c. *sestertia*, till the sum amounted to a thousand sestertia, which was a million of sesterces. But to avoid ambiguity, they did not use the neuter *sestertium* in the singular number, when the whole sum amounted to no more than a thousand sesterces, or one sestertium. They called a million of sesterces *decies nummum*, or *decies sestertiûm*, for *decies centena millia nummorum*, or *sestertiorum* (in the masculine gender), omitting *centena millia* for the sake of brevity. They likewise called the same sum *decies sestertium* (in the neuter gender) for *decies centies sestertium*, omitting *centies* for the same reason; or simply *decies*, omitting *centena millia sestertiûm*, or *centies sestertium*; and with the numeral adverbs *decies*, *vicies*, *centies*, *millies*, and the like, either *centena millia* or *centies* was always understood. These were their most usual forms of expression; though for *bina*, *dena*, *vicena sestertia*, they frequently said *bina*, *dena*, *vicena millia nummûm*. If the consular denarius contained 60 troy grains of fine silver, it was worth somewhat more than eight-pence farthing and a half sterling; and the as, of 16 to the denarius, little more than a half-penny. To reduce the ancient sesterces of two asses and a half, when the denarius passed for 16, to pounds sterling, multiply the given number by 5454, and cut off six figures on the right hand for decimals. To reduce *nummi sestertii*, or quarters of the denarius, to pounds sterling; if the given sum be consular money, multiply it by 8727, and cut off six figures on the right hand for decimals; and for imperial money diminish the said product by one-eighth of itself. Phil. Trans. Vol. LXI. Part II. art. 48.

To be qualified for a Roman knight, an estate of 400,000 *sesterces* was required; and for a senator, of 800,000.

Authors also mention a copper *sesterce*, worth about one third of a penny English.

Sesterce, or *sestertius*, was also used by the ancients for a thing containing two wholes and a half of another, as *as* was taken for any whole or integer.

Sestos || Setaceous. SESTOS, a noted fortress of European Turkey, situated at the entrance of the Hellespont or Dardanelles, 24 miles south-west of Gallipoli. This place is famous for the loves of Hero and Leander, sung by the poet Musæus.

SESUVIUM, in botany; a genus of plants belonging to the class of icosandria, and to the order of trigynia. The calyx is coloured and divided into five parts; there are no petals; the capsule is egg-shaped, three-celled, opening horizontally about the middle, and containing many seeds. There is only one species, the *portulacastrum*, porslane-leaved sesuvium, which is a native of the West Indies.

SET, or Sets, a term used by the farmers and gardeners to express the young plants of the white thorn and other shrubs, with which they use to raise their quick or quick-set hedges. The white thorn is the best of all trees for this purpose; and, under proper regulations, it seldom fails of answering the farmer's utmost expectations.

Set-off, in law, is an act whereby the defendant acknowledges the justice of the plaintiff's demand on the one hand: but, on the other, sets up a demand of his own, to counterbalance that of the plaintiff, either in the whole, or in part: as, if the plaintiff sues for 10l. due on a note of hand, the defendant may set off 9l. due to himself for merchandise sold to the plaintiff; and, in case he pleads such set-off, must pay the remaining balance into court. This answers very nearly to the *compensatio* or stoppage of the civil law, and depends upon the statutes 2 Geo. II. cap. 22. and 1 Geo. II. cap. 24.

SETACEOUS worm, in natural history, a name given by Dr Lister to that long and slender water-worm, which so much resembles a horse-hair, that it has been supposed by the vulgar to be an animated hair of that creature. These creatures, supposed to be living hairs are a peculiar sort of insects, which are bred and nourished within the bodies of other insects, as the worms of the ichneumon flies are in the bodies of the caterpillars.

Aldrovand describes the creature, and tells us it was unknown to the ancients; but called *seta aquatica*, and *vermis setarius* by the moderns, either from its figure resembling that of hair, or from the supposition of its once having been the hair of some animal. We generally suppose it, in the imaginary state of the hair, to have belonged to a horse; but the Germans say it was once the hair of a calf, and call it by a name signifying *vitulus aquaticus*, or the "water calf."

Albertus, an author much reverenced by the common people, has declared that this animal is generated of a hair; and adds, that any hair thrown into standing water, will, in a very little time, obtain life and motion. Other authors have dissented from this opinion, and supposed them generated of the fibrous roots of water-plants; and others, of the parts of grasshoppers fallen into the water. This last opinion is rejected by Aldrovand as the most improbable of all. Standing and foul waters are most plentifully stored with them; but they are sometimes found in the clearest and purest springs, and sometimes out of the water, on the leaves of trees and plants, as on the fruit-trees in our gardens, and the elms in hedges. They are from three to five inches long, of the thickness of a large hair; and are brown,

brown upon the back; and white under the belly, and the tail is white on every part.

SETH, the third son of Adam, the father of Enos, was born 3874 B. C. and lived 912 years.

SETHIANS, in church history, Christian heretics; so called because they paid divine worship to Seth, whom they looked upon to be Jesus Christ the son of God, but who was made by a third divinity, and substituted in the room of the two families of Abel and Cain, which had been destroyed by the deluge. These heretics appeared in Egypt in the second century; and as they were addicted to all sorts of debauchery, they did not want followers; and continued in Egypt above 200 years.

SETIMO, a town of Italy, in the province of Piedmont, situated on the river Po, eight miles north of Turin.

SETON, in surgery, a few horse hairs, small threads, or large packthread, drawn through the skin, chiefly the neck, by means of a large needle or probe, with a view to restore or preserve health.

We find by experience, that setons are very useful in catarrhs, inflammations, and other disorders, particularly those of the eyes, as a gutta serena, cataract, and incipient suffusion; to these we may add intense head-achs, with stupidity, drowsiness, epilepsies, and even the apoplexy itself.

SETTEE, in sea language, a vessel very common in the Mediterranean, with one deck and a very long and sharp prow. They carry some two masts, some three, without top-masts. They have generally two masts, equipped with triangular sails, commonly called *latern sails*. The least of them are of 60 tons burden. They serve to transport cannon and provisions for ships of war and the like. These vessels are peculiar to the Mediterranean sea, and are usually navigated by Italians, Greeks, or Mahometans.

SETTING, in astronomy, the withdrawing of a star or planet, or its sinking below the horizon. Astronomers and poets make three different kinds of setting of the stars, viz. the COSMICAL, ACRONYCAL, and HELIACAL. See these articles.

SETTING, in the sea language. To set the land or the sun by the compass, is to observe how the land bears on any point of the compass, or on what point of the compass the sun is. Also when two ships sail in sight of one another, to mark on what point the chase bears, is termed *setting the chase by the compass*.

SETTING, among sportsmen, a term used to express the manner of taking partridges by means of a dog peculiarly trained to that purpose. See SHOOTING.

ACT OF SETTLEMENT, in British history, a name given to the statute 12 and 13 W. III. cap. 2. whereby the crown was limited to his present majesty's illustrious house; and some new provisions were added, at the same fortunate era, for better securing our religion, laws, and liberties; which the statute declares to be the birthright of the people of England, according to the ancient doctrine of the common law.

SEVENTH, in music, an interval called by the Greeks *heptachordon*. See INTERVAL.

SEVERANCE, in law, the singling or severing two or more that join or are joined in the same writ or action. As if two join in a writ, *de libertate probanda*, and the one be afterwards nonsuited; here severance is permitted, so as notwithstanding the nonsuiting the one, the other may severally proceed.

There is also severance of the tenants in assize; when one, two, or more disseisees appear upon the writ, and not the other. And severance in debt, where two executors are named plaintiffs, and the one refuses to prosecute. We also meet with severance of summons, severance in attaints, &c. An estate in joint tenancy may be severed and destroyed by destroying any of its unities. 1. That of time, which respects only the original commencement of the joint estate, cannot indeed (being now part) be affected by any subsequent transaction. But, 2. The joint-tenants estate may be destroyed without any alienation, by merely disuniting their possession. 3. The jointure may be destroyed, by destroying the unity of title. And, 4. By destroying the unity of interest.

SEVERIA, a province of the Russian empire, with the title of a duchy, bounded on the north by Smolensko and Muscovy, on the east by Vorotinski and the country of the Cossacks, on the south by the same, and on the west by Zernegovia. It is a country overrun with woods, and on the south part is a forest of great length. Novogrodec, or Novogorod, is the capital town.

ST SEVERINA, a town of Italy, in the kingdom of Naples, and in Lower Calabria, with an archbishop's see. It is very well fortified, and seated on a craggy rock, on the river Neeto; in E. Long. 17. 14. N. Lat. 39. 15.

SEVERINO, a town of Italy, in the territory of the church, and in the Marche of Ancona, with a bishop's see. It has fine vineyards, and is seated between two hills on the river Petenza, in E. Long. 13. 6. N. Lat. 43. 16.

SEVERN, a river which rises near Plinlimmon Hill in Montgomeryshire, and before it enters Shropshire receives about 30 streams, and passes down to Landring, where it receives the Merda, that flows from Oswestry. When it arrives at Monford, it receives the river Mon, passing on to Shrewsbury, which it almost surrounds, then to Bridgeworth; afterwards it runs through the skirts of Staffordshire, enters Worcestershire, and passes by Worcester; then it runs to Tewkesbury, where it joins the Avon, and from thence to Gloucester, keeping a north-westerly course, till it falls into the Bristol Channel. It begins to be navigable for boats at Welchpool, in Montgomeryshire, and takes in several other rivers in its course, besides those already mentioned, and *is the second in England*. By the late inland navigation, it has communication with the rivers Mersey, Dee, Ribble, Ouse, Trent, Derwent, Humber, Thames, Avon, &c. which navigation, including its windings, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancaster, Westmoreland, Chester, Stafford, Warwick, Leicester, Oxford, Worcester, &c. A canal from Stroud Water, a branch of the Severn, to join the Thames, has lately been undertaken, by which great undertaking of conveying a tunnel 16 feet high and 16 feet wide, under Sapperton Hill and Hayley Wood (very high ground), for two miles and a quarter in length, through a very hard rock, lined and arched with brick, is entirely completed, and boats passed through it the 21st of May 1789. By this opening, a communication is made between the river Severn at Framiload

Lucombe's English Gazetteer.

 Framiload and the Thames near Lechlade, and will be continued over the Thames near Inglesham, into deep water in the Thames below St John-Bridge, and so to Oxford, &c. and London, for conveyance of coals, goods, &c. It is now navigable from the Severn to Themsford, by way of Stroud, Cirencester, Cricklade, &c. being filled with water for that purpose near 40 miles.

SEVERUS (Cornelius), an ancient Latin poet of the Augustan age; whose *Ætna*, together with a fragment *De morte Ciceronis*, were published with notes and a prose interpretation, by Le Clerc, 12mo, Amsterdam, 1703. They were before inserted among the *Catalecta Virgilii* published by Scaliger; whose notes, with others, Le Clerc has received among his own.

SEVERUS (Septimus), a Roman emperor, who has been so much admired for his military talents, that some have called him the most warlike of the Roman emperors. As a monarch he was cruel, and it has been observed that he never did an act of humanity or forgave a fault. In his diet he was temperate, and he always showed himself an open enemy to pomp and splendour. He loved the appellation of a man of letters, and he even composed a history of his own reign, which some have praised for its correctness and veracity. However cruel Severus may appear in his punishments and in his revenge, many have endeavoured to exculpate him, and observed that there was need of severity in an empire where the morals were so corrupted, and where no less than 3000 persons were accused of adultery during the space of 17 years. Of him, as of Augustus, some were fond to say, that it would have been better for the world if he had never been born, or had never died. See ROME, N° 372.

SEVERUS's Wall, in British topography, the fourth and last barrier erected by the Romans against the incursions of the North Britons. See the articles ADRIAN, and *ANTONINUS's Wall*.

We learn from several hints in the Roman historians, that the country between the walls of Hadrian and Antoninus continued to be a scene of perpetual war and subject of contention between the Romans and Britons, from the beginning of the reign of Commodus to the arrival of the emperor Septimus Severus in Britain, A. D. 206. This last emperor having subdued the Mæatæ, and repulsed the Caledonians, determined to erect a stronger and more impenetrable barrier than any of the former, against their future incursions.

Though neither Dio nor Herodian make any mention of a wall built by Severus in Britain for the protection of the Roman province, yet we have abundant evidence from other writers of equal authority, that he really built such a wall. "He fortified Britain (says Spartian) with a wall drawn cross the island from sea to sea; which is the greatest glory of his reign. After the wall was finished, he retired to the next station (York), not only a conqueror, but the founder of an eternal peace." To the same purpose, Aurelius Victor and Orosius, to say nothing of Eutropius and Cassiodorus: "Having repelled the enemy in Britain, he fortified the country, which was suited to that purpose, with a wall drawn cross the island from sea to sea."—"Severus drew a great ditch, and built a strong wall, fortified with several turrets, from sea to sea, to protect that part of the island which he had recovered from the yet unconquered nations." As the residence of the emperor Severus in Britain was not quite four years, it is probable that the two last of them were employed in building this wall; according to which account, it was begun A. D. 209, and finished A. D. 210.

This wall of Severus was built nearly on the same tract with Hadrian's rampart, at the distance only of a few paces north. The length of this wall, from Cousins' house near the mouth of the river Tyne on the east, to Boulness on the Solway frith on the west, hath been found, from two actual mensurations, to be a little more than 68 English miles, and a little less than 74 Roman miles. To the north of the wall was a broad and deep ditch, the original dimensions of which cannot now be ascertained, only it seems to have been larger than that of Hadrian. The wall itself, which stood on the south brink of the ditch, was built of free stone, and where the foundation was not good, it is built on piles of oak; the interstices between the two faces of this wall is filled with broad thin stones, placed not perpendicularly, but obliquely on their edges; the running mortar or cement was then poured upon them, which, by its great strength and tenacity, bound the whole together, and made it firm as a rock. But though these materials are sufficiently known, it is not easy to guess where they were procured, for many parts of the wall are at a great distance from any quarry of free stone; and, though stone of another kind was within reach, yet it does not appear to have been anywhere used. The height of this wall was 12 feet besides the parapet, and its breadth 8 feet, according to Bede, who lived only at a small distance from the east end of it, and in whose time it was almost quite entire in many places. Such was the wall erected by the command and under the direction of the emperor Severus in the north of England; and, considering the length, breadth, height, and solidity, it was certainly a work of great magnificence and prodigious labour. But the wall itself was but a part, and not the most extraordinary part, of this work. The great number and different kinds of fortresses which were built along the line of it for its defence, and the military ways with which it was attended, are still more worthy of our admiration, and come now to be described.

The fortresses which were erected along the line of Severus's wall for its defence, were of three different kinds, and three different degrees of strength; and were called by three different Latin words, which may be translated *stations*, *castles*, and *turrets*. Of each of these in their order.

The *stationes*, stations, were so called from their stability and the stated residence of garrisons. They were also called *castra*, which hath been converted into *chesters*, a name which many of them still bear. These were by far the largest, strongest, and most magnificent of the fortresses which were built upon the wall, and were designed for the head-quarters of the cohorts of troops which were placed there in garrison, and from whence detachments were sent into the adjoining castles and turrets. These stations, as appears from the vestiges of them which are still visible, were not all exactly of the same figure nor of the same dimensions; some of them being exactly squares, and others oblong, and some of them a little larger than others. These variations were no doubt occasioned by the difference of situation

tuation and other circumſtances. The ſtations were fortified with deep ditches and ſtrong walls, the wall itſelf coinciding with and forming the north wall of each ſtation. Within the ſtations were lodgings for the officers and ſoldiers in garriſon; the ſmalleſt of them being ſufficient to contain a cohort, or 600 men. Without the walls of each ſtation was a town, inhabited by labourers, artificers, and others, both Romans and Britons, who choſe to dwell under the protection of theſe fortreſſes. The number of the ſtations upon the wall was exactly 18; and if they had been placed at equal diſtances, the interval between every two of them would have been four miles and a few paces: but the intervention of rivers, marſhes, and mountains; the conveniency of ſituations for ſtrength, proſpect, and water; and many other circumſtances to us unknown, determined them to place theſe ſtations at unequal diſtances. The ſituation which was always choſen by the Romans, both here and everywhere elſe in Britain where they could obtain it, was the gentle declivity of a hill, near a river, and facing the meridian ſun. Such was the ſituation of the far greateſt part of the ſtations on this wall. In general, we may obſerve, that the ſtations ſtood thickeſt near the two ends and in the middle, probably becauſe the danger of invaſion was greateſt in theſe places. But the reader will form a clearer idea of the number of theſe ſtations, their Latin and Engliſh names, their ſituation and diſtance from one another, by inſpecting the following table, than we can give him with equal brevity in any other way. The firſt column contains the number of the ſtation, reckoning from eaſt to weſt; the ſecond contains its Latin, and the third its Engliſh name; and the three laſt its diſtance from the next ſtation to the weſt of it, in miles, furlongs, and chains.

N°	Latin Name.	Engliſh Name.	M.	F.	C
1	Segedunum	Couſins'-houſe	3	5	1½
2	Pons Ælii	Newcaſtle	2	0	9
3	Condercum	Bexwell hill	6	6	5
4	Vindobala	Rutcheſter	7	0	3½
5	Hunnum	Halton-cheſters	5	1	7
6	Cilurnum	Walwick-cheſters	3	1	8
7	Procolitia	Carrawhrugh	4	5	3½
8	Borcovicus	Houſeſteeds	1	3	8
9	Vindolana	Little-cheſters	3	6	4
10	Æſica	Great-cheſters	2	1	6½
11	Magna	Carrvoran	2	6	0
12	Ambuglanna	Burdoſwald	6	2	8
13	Petriana	Cambeck	2	6	6
14	Aballaba	Watchcroſs	5	1	9
15	Congavata	Stanwix	3	3	4
16	Axelodunum	Brugh	4	0	9
17	Gabroſentum	Brumbrugh	3	4	1
18	Tunnocelum	Boulneſs	0	0	0
		Length of the wall	68	3	3

The *caſtella*, or caſtles, were the ſecond kind of fortifications which were built along the line of this wall for its defence. Theſe caſtles were neither ſo large nor ſtrong as the ſtations, but much more numerous, being no fewer than 81. The ſhape and dimenſions of the caſtles, as appears from the foundations of many of them which are ſtill viſible, were exact ſquares of 66 feet every way. They were fortified on every ſide with thick and lofty walls, but without any ditch, except on the north ſide; on which the wall itſelf, raiſed much above its uſual height, with the ditch attending it, formed the fortification. The caſtles were ſituated in the intervals between the ſtations, at the diſtance of about ſeven furlongs from each other; though particular circumſtances ſometimes occaſioned a little variation. In theſe caſtles guards were conſtantly kept by a competent number of men detached from the neareſt ſtations.

The *turres*, or turrets, were the third and laſt kind of fortifications on the wall. Theſe were ſtill much ſmaller than the caſtles, and formed only a ſquare of about 12 feet, ſtanding out of the wall on its ſouth ſide. Being ſo ſmall, they are more entirely ruined than the ſtations and caſtles, which makes it difficult to diſcover their exact number. They ſtood in the intervals between the caſtles; and from the faint veſtiges of a few of them, it is conjectured that there were four of them between every two caſtles, at the diſtance of about 300 yards from one another. According to this conjecture, the number of the turrets amounted to 324. They were deſigned for watch towers and places for ſentinels, who, being within hearing of one another, could convey an alarm or piece of intelligence to all parts of the wall in a very little time.

Such were the ſtations, caſtles, and turrets, on the wall of Severus; and a very conſiderable body of troops was conſtantly quartered in them for its defence. The uſual complement allowed for this ſervice was as follows:

1. Twelve cohorts of foot, conſiſting of 600 men each,	7,200
2. One cohort of mariners in the ſtation at Boulneſs, - -	600
3. One detachment of Moors, probably equal to a cohort, - -	600
4. Four alæ or wings of horſe, conſiſting, at the loweſt computation, of 400 each, -	1,600
	10,000

For the conveniency of marching theſe troops from one part of the wall to another, with the greater eaſe and expedition, on any ſervice, it was attended with two military ways, paved with ſquare ſtones, in the moſt ſolid and beautiful manner. One of theſe ways was ſmaller, and the other larger. The ſmaller military way run cloſe along the ſouth ſide of the wall, from turret to turret, and caſtle to caſtle for the uſe of the ſoldiers in relieving their guards and centinels, and ſuch ſervices. The larger way did not keep ſo near the wall, nor touch at the turrets or caſtles, but purſued the moſt direct courſe from one ſtation to another, and was deſigned for the conveniency of marching larger bodies of troops.

It is to be regretted, that we cannot gratify the reader's curioſity, by informing him by what particular bodies of Roman troops the ſeveral parts of this great work were executed; as we were enabled to do with regard to the wall of Antoninus Pius from inſcriptions. For though it is probable that there were

Severus. ftones with infcriptions of the fame kind, mentioning the feveral bodies of troops, and the quantity of work performed by each of them, originally inferted in the face of this wall, yet none of them are now to be found. There have indeed been difcovered, in or near the ruins of this wall, a great number of fmall fquare ftones, with very fhort, and generally imperfect infcriptions upon them; mentioning particular legions, cohorts and centuries; but without directly afferting that they had built any part of the wall, or naming any number of paces. Of thefe infcriptions, the reader may fee no fewer than twenty-nine among the Northumberland and Cumberland infcriptions in Mr Horfley's Britannia Romana. As the ftones on which thefe infcriptions are cut are of the fame fhape and fize with the other facing-ftones of this wall, it is almoft certain that they have been originally placed in the face of it. It is equally certain, from the uniformity of thefe infcriptions, that they were all intended to intimate fome one thing, and nothing fo probable as that the adjacent wall was built by the troops mentioned in them. This was, perhaps, fo well underftood, that it was not thought neceffary to be expreffed; and the diftance of thefe infcriptions from one another fhowed the quantity of work performed. If this was really the cafe, we know in general, that this great work was executed by the fecond and fixth legions, thefe being the only legions mentioned in thefe infcriptions. Now, if this prodigious wall, with all its appendages of ditches, ftations, caftles, turrets, and military ways, was executed in the fpace of two years by two legions only, which, when moft complete, made no more than 12,000 men, how greatly muft we admire the fkill, the induftry, and excellent difcipline of the Roman foldiers, who were not only the valiant guardians of the empire in times of war, but its moft active and ufeful members in times of peace?

This wall of Severus, and its fortreffes, proved an impenetrable barrier to the Roman territories for near 200 years. But about the beginning of the 5th century, the Roman empire being affaulted on all fides, and the bulk of their forces withdrawn from Britain, the Mæatæ and Caledonians, now called *Scots* and *Picts*, became more daring; and fome of them breaking through the wall, and others failing round the ends of it, they carried their ravages into the very heart of Provincial Britain. Thefe invaders were indeed feveral times repulfed after this by the Roman legions fent to the relief of the Britons. The laft of thefe legions, under the command of Gallio of Ravenna, having, with the affiftance of the Britons, thoroughly repaired the breaches of Severus's wall and its fortreffes, and exhorted the Britons to make a brave defence, took their final farewell of Britain. It foon appeared, that the ftrongeft walls and ramparts are no fecurity to an undifciplined and daftardly rabble, as the unhappy Britons then were. The Scots and Picts met with little refiftance in breaking through the wall, while the towns and caftles were tamely abandoned to their deftructive rage. In many places they levelled it with the ground, that it might prove no obftruction to their future inroads.—From this time no attempts were ever made to repair this noble work. Its beauty and grandeur procured it no refpect in the dark and taftelefs ages which fucceeded. It became the common quarry for more than a thoufand years, out of which all the towns and villages around were built; and is now fo entirely ruined, that the moft penetrating eyes of the moft poring and patient antiquarian, can hardly trace its vanifhing foundations.

Sevigné. SEVIGNÉ (Marie de Rabutin, Marquiffe de), a French lady, was born in 1626. When only a year old fhe loft her father, who was killed in the defcent of the Englifh on the ifle of Rhé, where he commanded a company of volunteers. In 1644 fhe married the Marquis of Sevigné, who was flain in a duel by the Chevalier d'Albret, in 1651. She had by him a fon and a daughter, to the education of whom fhe afterwards religioufly devoted herfelf. Her daughter was married in 1669 to the count of Grignan, who conducted her to Provence. Madame de Sevigné confoled herfelf by writing frequent letters to her daughter. She fell at laft the victim to her maternal tendernefs. In one of her vifits to Grignan, fhe fatigued herfelf fo much during the ficknefs of her daughter, that fhe was feized with a fever, which carried her off on the 14th of January 1696. We have two portraits of Madame de Sevigné; the one by the Compte de Buffi, the other by Madame de la Fayette. The firft exhibits her defects; the fecond her excellencies. Buffi defcribes her as a lively gay coquette, a lover of flattery, fond of titles, honour, and diftinction: M. de la Fayette as a woman of wit and good fenfe, as poffeffed of a noble foul, formed for difpenfing benefits, incapable of debafing herfelf by avarice, and bleffed with a generous, obliging, and faithful heart. Both thefe portraits are in fome meafure juft. That fhe was vain-glorious, appears evident from her own letters, which, on the other hand, exhibit undoubted proofs of her virtue and goodnefs of heart.

This illuftrious lady was acquainted with all the wits of her age. It is faid that fhe decided the famous difpute between Perrault and Boileau concerning the preference of the ancients to the moderns, thus, "The ancients are the fineft, and we are the pretticft." She left behind her a moft valuable collection of letters, the beft edition of which is that of 1775, in 8 vols. 12mo. "Thefe letters (fays Voltaire) are filled with anecdotes, written with freedom, and in a natural and animated ftyle; are an excellent criticifm upon ftudied letters of wit, and ftill more upon thofe fictitious letters which aim at the epiftolary ftyle, by a recital of falfe fentiments and feigned adventures to an imaginary correfpondent." It were to be wifhed that a proper felection had been made of thefe letters. It is difficult to read 8 volumes of letters, which, though inimitably written, prefent frequent repetitions, and are often filled with trifles. What makes them in general perhaps fo interefting is, that they are in part hiftorical. They may be looked upon as a relation of the manners, the ton, the genius, the fafhions, the etiquette, which reigned in the court of Louis XIV. They contain many curious anecdotes nowhere elfe to be found: But thefe excellencies would be ftill more ftriking, were they fometimes ftripped of that multitude of domeftic affairs and minute incidents which ought naturally to have died with the mother and the daughter. A volume entitled *Sevigniana* was publifhed at Paris in 1756, which is nothing more than a collection of the fine fentiments, literary and hiftorical anecdotes, and moral apothegms, fcattered throughout thefe letters.

Siecle de Louis XIV. Tom. II.

SEVILLE,

Seville. SEVILLE, a large and populous city of Spain, ſtands on the banks of the Guadalquiver, in the midſt of a rich, and to the eye a boundleſs, plain; in W. Long 5°. 5′. N. Lat. 37°. 20′. This city is ſuppoſed to have been founded by the Phœnicians, who gave it the name of *Hiſpalis*. When it fell under the power of the Romans, it was called *Julia;* and at laſt, after a variety of corruptions, was called *Sebilla* or *Sevilla;* both of which names are retained by the Spaniards. The Romans embelliſhed it with many magnificent edifices; of which ſcarce any veſtige now remains. The Gothic kings for ſome time made it their reſidence: but in proceſs of time they removed their court to Toledo; and Seville was taken by ſtorm ſoon after the victory obtained at Xeres over the Gothic king Rodrigo.—In 1027, Seville became an independent monarchy; but was conquered 70 years afterwards by Yuſef Almoravides, an African prince. At laſt it was taken by Ferdinand III. after a year's ſiege; and 300,000 Moors were then obliged to leave the place. Notwithſtanding this prodigious emigration, Seville continued to be a great and populous city, and ſoon after it was enlarged and adorned with many magnificent buildings, the chief of which is the cathedral. Seville arrived at its utmoſt pitch of grandeur a little after the diſcovery of America, the reaſon of which was, that all the valuable productions of the Weſt Indies were carried thither. Its court was then the moſt ſplendid in Europe; but in the courſe of a few years all this grandeur diſappeared, owing to the impediments in navigating the Guadalquiver. The ſuperior excellence of the port of Cadiz induced government to order the galeons to be ſtationed there in time to come.

Seville is of a circular form, and is ſurrounded by a wall about five miles and a half in circumference, containing 176 towers. The ditch in many places is filled up. The ſtreets of Seville are crooked and dirty, and moſt of them ſo narrow that two carriages can ſcarcely paſs one another abreaſt.

Seville is ſaid to contain 80,268 ſouls, and is divided into 30 pariſhes. It has 84 convents, with 24 hoſpitals.

Townſend's Travels, Vol. II. Of the public edifices of this city the cathedral is the moſt magnificent. Its dimenſions are 420 feet in length, 263 in breadth within the walls, and 126 feet in height. It has nine doors, 80 altars, at which 500 maſſes are daily celebrated, and 80 windows of painted glaſs, each of which coſt 1000 ducats. At one angle ſtands a tower of Mooriſh workmanſhip 350 feet high. On the top of it is the giralda, or large brazen image, which, with its palm branch, weighs near one ton and a half, yet turns as a weather-cock with the ſlighteſt variation of the wind. The whole work is brick and mortar. The paſſage to the top is an inclined plane, which winds about in the inſide in the manner of a ſpiral ſtaircaſe, ſo eaſy of aſcent that a horſe might trot from the bottom to the top; at the ſame time it is ſo wide that two horſemen may ride abreaſt. What appears very unaccountable, the ſolid maſonry in the upper half is juſt as thick again as that in the lower, tho' on the outſide the tower is all the way of the ſame dimenſions. In the opinion of Mr Swinburne, this cathedral is inferior to Yorkminſter. Its treaſures are ineſtimable; one altar with all its ornaments is ſolid ſilver; of the ſame metal are the images of St Iſidore and St Leander, which are as large as the life; and a tabernacle for the hoſt more than four yards high, adorned with eight and forty columns. Before the choir of the cathedral is the tomb of the celebrated Chriſtopher Columbus, the diſcoverer of America. His monument conſiſts of one ſtone only, on which theſe words are inſcribed, *A Caſtilla y Arragon otro mundo dio Colon;* that is, "To Caſtile and Arragon Columbus gave another world:" an inſcription ſimple and expreſſive, the juſtneſs of which will be acknowledged by thoſe who have read the adventures of this illuſtrious but unfortunate man. (Bourgoanne's Travels, Vol. II.) The cathedral was begun by Don Sancho the Brave, about the cloſe of the 13th century, and finiſhed by John II. about a hundred years after. To the cathedral belongs a library of 20,000 volumes, collected by Hernando the ſon of Columbus; but, to the diſgrace of the Spaniards, it has ſcarcely received any addition ſince the death of the founder. The organ in this cathedral is a very ingenious piece of mechaniſm *. "I was much pleaſed (ſays Mr Townſend in his intereſting travels) with the conſtruction of a new organ, containing 5300 pipes, with 110 ſtops, which latter, as the builder told me, is 50 more than are in the famous one of Haarlem; yet, ſo ample are the bellows, that when ſtretched they ſupply the full organ 15 minutes. The mode of filling them with air is ſingular; for inſtead of working with his hands, a man walks backwards and forwards along an inclined plane of about 15 feet in length, which is balanced in the middle on its axis; under each end is a pair of bellows, of about ſix feet by three and a half. Theſe communicate with five other pair united by a bar; and the latter are ſo contrived, that when they are in danger of being overſtrained, a valve is lifted up, and gives them relief. Paſſing 10 times along the inclined plane fills all theſe veſſels."

* Vol. II. p. 318.

The Canos de Carmone, or great aqueduct of Seville, is reckoned by the hiſtorians of this city one of the moſt wonderful works of antiquity. Mr Swinburne, however, remarks, that it is ugly, crooked, the arches unequal, and the architecture neglected. The conduit is ſo leaky, that a rivulet is formed by the waſte water. Nevertheleſs, it ſtill conveys to the city an ample ſupply of water ſufficient to turn ſeveral mills, and to give almoſt every houſe in town the benefit of it. (Swinburne's Travel, p. 283.)

Many of the convents are remarkable for the beauty of their architecture; but in Seville the eye covets only pictures, of which there is a wonderful profuſion. Among theſe are the works of the famous painter Murillo, with many others univerſally admired.

The convent of the Franciſcans contains 15 cloiſters, with apartments for 200 monks, though, when Mr Townſend viſited them, they amounted only to 140. The annual expenditure of theſe, who are all fed on charity, is about 4000l. ſterling. "In the principal cloiſter (ſays the ſame intelligent traveller), which is entirely encloſed by a multitude of little chapels, are repreſented, in 14 pictures, each called a *ſtation*, all the ſufferings of the Redeemer. Theſe are ſo arranged as to mark given diſtances by walking round the cloiſter from the firſt to the ſecond, and ſo in order to the reſt. Over them is mentioned the number of ſteps taken by our Lord between the ſeveral incidents of his paſſion in his way to Calvary; and theſe preciſely are the paces (Townſend's Travels, Vol. II. p. 326.)

meaſured

Seville.

meaſured for the penitents in their progreſs from one ſtation to another. Over one is the following inſcription: 'This ſtation conſiſts of 1087 ſteps. Here the bleſſed Redeemer fell a ſecond time under the weight of his croſs, and here is to be gained the indulgence of ſeven years and forty quarantines. Mental prayer, the Paternoſter, and the Ave Maria.' This may ſerve as an example for the reſt."

The principal manufacture of Seville is ſnuff. Mr Townſend, who paid particular attention to it, informs us, that the building in which it is carried on is elegant and ſimple in its form, and is about 600 feet by 480, and not leſs than 60 feet in height, with four regular fronts, encloſing 28 quadrangles. It coſt 37,000,000 of reals, or about 370,000l. At preſent (1787), no more than 1700 workmen are employed, and 100 horſes or mules; but formerly 3000 men were engaged, and near 400 horſes. This falling off is attributed by Mr Swinburne to a practice which the directors followed of adulterating the tobacco with the red earth of Almazarron. When Mr Townſend viſited this manufacture, they had changed their ſyſtem. From the year 1780, he informs us, the annual ſale of tobacco from Brazil has been 1,500,000 pounds, purchaſed from the Portugueſe at three reals a pound; and of ſnuff from the produce of their own colonies 1,600,000 pounds, beſides *cigars* (A) to a very conſiderable amount. They have lying by them more than 5,000,000 of pounds of ſnuff unſold; but as it will not ſuffer by age, they are not uneaſy at this accumulation. Beſides the peculiar kind of ſnuff with which Spain was accuſtomed to ſupply the market, they have lately introduced the manufacture of rappee. In this branch alone are employed 220 perſons, old and young, with 16 mules.

"All the workmen (continues Mr Townſend) depoſite their cloaks at the door; and when they go out are ſo ſtrictly examined, that they have little chance of being able to conceal tobacco; yet they ſometimes venture to hide it about their perſons. An officer and a guard is always attending to take delinquents into cuſtody; and that they may prevent reſiſtance, no workman is permitted to enter with a knife. Were it not for this precaution, the conſequence of a detection might be fatal. The whole buſineſs is conducted by a director, with a ſalary of 40,000 reals a year, and 54 ſuperior officers, aſſiſted by as many ſubordinate to them. For grinding their ſnuff, they have 40 mills, each conſiſting of a ſtone roller, moved by a large horſe or mule, with the traces faſtened to a beam of eight feet in length, in the angle of 45 degrees, conſequently loſing preciſely half his force."

Before Mr Townſend left Seville, according to his uſual practice, which was truly laudable, he inquired into the prices of labour and proviſions. As a piece of curious and uſeful information, and as an example to other travellers, we preſent them to our readers. They are as follow:

Day-labourers - $4\frac{1}{2}$ reals, about	L. 0	0	$10\frac{1}{4}$
Carpenters from 7 to 11 ——			
Joiners, if good workmen, - 24 —— or -	0	4	9
Weavers, if good workmen, 15 reals, about - -	L. 0	3	0
Bread, for 3 lb. of 16 oz. or 16 quartos, or	0	0	$4\frac{1}{2}$
—— ſometimes 28 quartos, or	0	0	$7\frac{7}{8}$
Beef, 30 quartos for 32 oz. per lb. about	0	0	$4\frac{1}{2}$
Mutton, 38 do. do. - -	0	0	$5\frac{11}{32}$
Kid, 24 do. - -	0	0	$3\frac{3}{8}$
Pork from 36 to 42 quartos, do. or	0	0	$5\frac{1}{16}$
to	0	0	$5\frac{29}{32}$

The price of wheat has at different periods been very remarkable. In 1652, it ſold at the rate of 15s. $3\frac{1}{2}$d. the buſhel; and in 1657, it fell ſo low as 1s. $4\frac{1}{2}$d. per buſhel, reckoning the ſanega at $109\frac{1}{2}$ lb. and the buſhel at 70.

Sevum || Sewer.

SEVUM MINERALE, mineral tallow; a ſubſtance ſomewhat reſembling tallow, found on the ſea coaſts of Finland in the year 1736. It burns with a blue flame, and ſmell of greaſe, leaving a black viſcid matter which cannot eaſily be conſumed. It is extremely light; being only of the ſpecific gravity of 0.770; whereas tallow is not leſs than 0.969. It is partly ſoluble in highly rectified ſpirit of wine; but entirely ſo in expreſſed oils when boiling. It is met with in ſome of the rocky parts of Perſia, but there it appears to be mixed with petroleum. Dr Herman of Straſburg mentions a ſpring in the neighbourhood of that city which contains a ſubſtance of this ſort diffuſed through it, ſeparating, and capable of being collected on ebullition.—A fat mineral matter reſembling butter or tallow has lately been extracted from peat in Lancaſhire. See PEAT.

SEWAURY, a Hindoo word uſed in Bengal, and ſignifying the train of attendants that accompany a nabob or great man.

SEWER, *in the Houſehold*, an officer who arranges on the table the diſhes of a king or nobleman.

SEWER is alſo a paſſage or gutter made to carry water into the ſea or a river, whereby to preſerve the land, &c. from inundations and other annoyances.

Court of Commiſſioners of SEWERS *in England*, a temporary tribunal, erected by virtue of a commiſſion under the great ſeal; which formerly uſed to be granted *pro re nata* at the pleaſure of the crown, but now at the diſcretion and nomination of the lord chancellor, lord treaſurer, and chief juſtices, purſuant to the ſtatute 23 Hen. VIII. c. 5. Their juriſdiction is to overlook the repairs of ſea banks and ſea walls, and the cleanſing of rivers, public ſtreams, ditches, and other conduits, whereby any waters are carried off; and is confined to ſuch county or particular diſtrict as the commiſſion ſhall expreſsly name. The commiſſioners are a court of record, and may fine and impriſon for contempts; and in the execution of their duty may proceed by jury, or upon their own view, and may take order for the removal of any annoyances, or the ſafeguard and conſervation of the ſewers within their commiſſion, either according to the laws and cuſtoms of Romney marſh, or otherwiſe at their own diſcretion. They may alſo aſſeſs ſuch rates or ſcots upon the owners of lands within their diſtrict as they ſhall judge neceſſary: and if any perſon refuſes to pay them, the commiſſioners may levy the

(A) Theſe are little rolls of tobacco which the Spaniards ſmoke without a pipe.

Sewer.

the same by distress of his goods and chattels: or they may, by statute 23 Hen. VIII. c. 5. sell his freehold-lands (and by the 7 Ann. c. 10. his copyhold also), in order to pay such scots or assessments. But their conduct is under the controul of the court of King's bench, which will prevent or punish any illegal or tyrannical proceedings. And yet in the reign of King James I. (8th Nov. 1616.), the privy council took upon them to order, that no action or complaint should be prosecuted against the commissioners unless before that board; and committed several to prison who had brought such actions at common law, till they should release the same: and one of the reasons fur discharging Sir Edward Coke from his office of lord chief justice, was for countenancing those legal proceedings. The pretence for these arbitrary measures was no other than the tyrant's plea of the *necessity* of unlimited powers in works of evident utility to the public, "the supreme reason above all reasons, which is the salvation of the king's lands and people." But now it is clearly held, that this (as well as all other inferior jurisdictions) is subject to the discretionary coercion of his majesty's court of King's bench.

Ferguson's Roman History.

Common SEWERS, in Rome, were executed at a great expence. It was proposed that they should be of sufficient dimensions to admit a waggon loaded with hay. When these common sewers came to be obstructed, or out of repair, under the republic, the censors contracted to pay a thousand talents, or about 193,000l. for clearing and repairing them. They were again in disrepair at the accession of Augustus Cæsar, and the reinstating them is mentioned among the great works of Agrippa. He is said to have turned the course of seven rivers into these subterraneous passages, to have made them navigable, and to have actually passed in barges under the streets and buildings of Rome. These works are still supposed to remain; but as they exceed the power and resources of the present city to keep them in repair, they are quite concealed, except at one or two places. They were in the midst of the Roman greatness, and still are reckoned among the wonders of the world; and yet they are said to have been works of the elder Tarquin, a prince whose territory did not extend, in any direction, above 16 miles; and, on this supposition, they must have been made to accommodate a city that was calculated chiefly for the reception of cattle, herdsmen, and banditti. Rude nations sometimes execute works of great magnificence, as fortresses and temples, for the purposes of war and superstition; but seldom palaces, and still more seldom works of mere convenience and cleanliness, in which for the most part they are long defective. It is not unreasonable, therefore, to question the authority of tradition in respect to this singular monument of antiquity, which so greatly exceeds what the best accommodated city of modern Europe could undertake for its own conveniency. And as those works are still entire, and may continue so for thousands of years, it may be suspected that they were even prior to the settlement of Romulus, and may have been the remains of a mere ancient city, on the ruins of which the followers of Romulus settled, as the Arabs now hut or encamp on the ruins of Palmyra and Balbeck. Livy owns, that the common sewers were not accommodated to the plan of Rome, as it was laid out in his time; they were carried in directions across the streets, and passed under buildings of the greatest antiquity. This derangement indeed he imputes to the hasty rebuilding of the city after its destruction by the Gauls; but haste, it is probable, would have determined the people to build on their old foundations, or at least not to change them so much as to cross the direction of former streets.

Sex.

SEX, the property by which any animal is male or female.

Lavater has drawn the following characteristic distinctions between the male and female of the human species.

"The primary matter of which women are constituted appears to be more flexible, irritable, and elastic, than that of man. They are formed to maternal mildness and affection; all their organs are tender, yielding, easily wounded, sensible, and receptible. Among a thousand females there is scarcely one without the generic feminine signs; the flexible, the circular, and the irritable.

"They are the counterpart of man, taken out of man, to be subject to man; to comfort him like angels, and to lighten his cares. "She shall be saved in child-bearing, if they continue in faith, and charity, and holiness, with sobriety" (1 Tim. ii. 15). This tenderness, this sensibility, this light texture of their fibres and organs, this volatility of feeling, render them so easy to conduct and to tempt; so ready of submission to the enterprise and power of the man; but more powerful through the aid of their charms than man with all his strength. The man was not first tempted, but the woman; afterward the man by the woman. And, not only easy to be tempted, she is capable of being formed to the purest, noblest, most seraphic virtue; to every thing which can deserve praise or affection. Highly sensible of purity, beauty, and symmetry, she does not always take time to reflect on internal life, internal death, internal corruption. 'The woman saw that the tree was good for food, and that it was pleasant to the eyes, and a tree to be desired to make one wise, and she took of the fruit thereof.' (Gen. iii. 6.)

"The female thinks not profoundly; profound thought is the power of the man. Women feel more. Sensibility is the power of woman. They often rule more effectually, more sovereignly, than man. They rule with tender looks, tears, and sighs; but not with passion and threats; for if, or when, they so rule, they are no longer women but abortions. They are capable of the sweetest sensibility, the most profound emotion, the utmost humility, and the excess of enthusiasm. In their countenance are the signs of sanctity and inviolability, which every feeling man honours, and the effects of which are often miraculous. Therefore, by the irritability of their nerves, their incapacity for deep inquiry and firm decision, they may easily from their extreme sensibility become the most irreclaimable, the most rapturous enthusiasts. Their love, strong and rooted as it is, is very changeable; their hatred almost incurable, and only to be effaced by continued and artful flattery. Men are most profound; women are more sublime.

"Men most embrace the whole; women remark individually, and take more delight in selecting the minutiæ which form the whole. Man hears the bursting thunder,

Sex.

thunder, views the destructive bolt with serene aspect, and stands erect amidst the fearful majesty of the streaming clouds. Woman trembles at the lightning, and the voice of distant thunder; and shrinks into herself, or sinks into the arms of man. Man receives a ray of light single, woman delights to view it through a prism in all its dazzling colours. She contemplates the rainbow as the promise of peace; he extends his inquiring eye over the whole horizon. Woman laughs, man smiles; woman weeps, man remains silent. Woman is in anguish when man weeps, and in despair when man is in anguish; yet has she often more faith than man. Man without religion, is a diseased creature, who would persuade himself he is well, and needs not a physician; but woman without religion, is raging and monstrous. A woman with a beard is not so disgusting as a woman who acts the freethinker; her sex is formed to piety and religion; to them Christ first appeared; but he was obliged to prevent them from too ardently, and too hastily, embracing him: 'Touch me not.' They are prompt to receive and seize novelty, and become its enthusiasts. The whole world is forgotten in the emotion caused by the presence and proximity of him they love. They sink into the most incurable melancholy, as they also rise to the most enraptured heights.

"Male sensation is more imagination, female more heart. When communicative, they are more communicative than man; when secret, more secret. In general they are more patient, long-suffering, credulous, benevolent, and modest. Woman is not a foundation on which to build. She is the gold, silver, precious stones, wood, hay, stubble (1 Cor. iii. 12.); the materials for building on the male foundation. She is the leaven, or more expressively the oil to the vinegar of man: the second part of the book of man.

"Man singly is but half man; at least but half human; a king without a kingdom. Woman, who feels properly what she is, whether still or in motion, rests upon the man; nor is man what he may and ought to be, but in conjunction with woman: therefore, 'it is not good that man should be alone, but that he should leave father and mother, and cleave to his wife, and they two shall be one flesh."

They differ also in their exterior form and appearance.

"Man is the most firm; woman the most flexible. Man is the straightest; woman the most bending. Man stands stedfast; woman gently retreats. Man surveys and observes; woman glances and feels. Man is serious: woman is gay. Man is the tallest and broadest; woman the smallest and weakest. Man is rough and hard; woman smooth and soft. Man is brown; woman is fair. Man is wrinkly; woman is not. The hair of man is more strong and short; of woman more long and pliant. The eyebrows of man are compressed; of woman less frowning. Man has most convex lines; woman most concave. Man has most straight lines; woman most curved. The countenance of man taken in profile is more seldom perpendicular than that of the woman. Man is most angular; woman most round."

Fitzosborn's Letters.

In determining the comparative merit of the two sexes, it is no derogation from female excellency that it differs in kind from that which distinguishes the male part of our species; and if, in general, it should be found (what upon an impartial inquiry will most certainly be found) that women fill up their appointed circle of action with greater regularity than men, the claim of preference cannot justly be decided in our favour. In the prudential and economical parts of life, it is undeniable that they rise far above us; and if true fortitude of mind is best discovered by a cheerful resignation to the measures of Providence, we shall not find reason, perhaps to claim that most singular of the human virtues as our peculiar privilege. There are numbers of the other sex who, from the natural delicacy of their constitution, pass through one continued scene of suffering from their cradles to their graves, with a firmness of resolution that would deserve so many statues to be erected to their memories, if heroism were not esteemed more by the splendour than the merit of actions.

But whatever real difference there may be between the moral or intellectual powers of the male and female mind, Nature does not seem to have marked the distinction so strongly as our vanity is willing to imagine; and after all, perhaps, education will be found to constitute the principal superiority. It must be acknowledged, at least, that in this article we have every advantage over the softer sex that art and industry can possibly secure to us. The most animating examples of Greece and Rome are set before us, as early as we are capable of any observation; and the noblest compositions of the ancients are given into our hands almost as soon as we have strength to hold them; while the employments of the other sex, at the same period of life, are generally the reverse of every thing that can open and enlarge their minds, or fill them with just and rational notions. The truth of it is, female education is so much worse than none, as it is better to leave the mind to its natural and uninstructed suggestions, than to lead it into false pursuits, and contract its views, by turning them upon the lowest and most trifling objects. We seem, indeed, by the manner in which we suffer the youth of that sex to be trained, to consider women agreeably to the opinion of certain Mahometan doctors, and treat them as if we believed they had no souls: why else are they

> Bred only, and completed to the taste
> Of lustful appetence, to sing, to dance,
> To dress, and troul the tongue, and roll the eye.
>
> MILTON.

This strange neglect of cultivating the female mind can hardly be allowed as good policy, when it is considered how much the interest of society is concerned in the rectitude of their understandings. That season of every man's life which is most susceptible of the strongest impressions, is necessarily under female direction; as there are few instances, perhaps, in which that sex is not one of the secret springs which regulate the most important movements of private or public transactions. What Cato observes of his countrymen is in one respect true of every nation under the sun: "The Romans (said he) govern the world, but it is the women that govern the Romans."

If it be true then (as true beyond all peradventure it is) that female influence is thus extensive, nothing certainly can be of more importance than to give it a proper tendency, by the assistance of a well directed education. Far are we from recommending any attempts to

to render women learned; yet furely it is neceffary they fhould be raifed above ignorance. Such a general tincture of the moft ufeful fciences as may ferve to free the mind from vulgar prejudices, and give it a relifh for the rational exercife of its powers, might very juftly enter into a plan of female erudition. That fex might be taught to turn the courfe of their reflections into a proper and advantageous channel, without any danger of rendering them too elevated for the feminine duties of life. In a word, they ought to be confidered as defigned by Providence for ufe as well as fhow, and trained up, not only as women, but as rational creatures.

Sex of Bees. See Bee.

Sex of Plants. See Botany, p. 448.

SEXAGENARY, fomething relating to the number fixty: thus fexagenary or fexagefimal arithmetic is a method of computation proceeding by fixties; fuch is that ufed in the divifion of a degree into fixty minutes, of the minute into fixty feconds, of the fecond into fixty thirds, &c. Alfo fexagenary tables are tables of proportional parts, fhowing the product of two fexagenaries that are to be multiplied, or the quotient of the two that are to be divided.

SEXAGESIMA, the fecond Sunday before Lent, or the next to Shrove Sunday, fo called as being about the 60th day before Eafter.

SEXAGESIMALS, or *Sexagesimal Fractions*, fractions whofe denominators proceed in a fexagecuple ratio; that is, a prime, or the firft minute, $= \frac{1}{60}$: a fecond $= \frac{1}{3600}$; a third $= \frac{1}{216000}$. Anciently, there were no other than fexagefimals ufed in aftronomy; and they are ftill retained in many cafes, though decimal arithmetic begins to grow in ufe now in aftronomical calculations. In thefe fractions, which fome call *aftronomical fractions*, the denominator being always 60, or a multiple thereof, is ufually omitted, and the numerator only written down: thus, $4^{\circ}, 59', 32'', 50''', 16''''$, is to be read, 4 degrees, 59 minutes, 32 feconds, 50 thirds, 16 fourths, &c.

SEXTANS, Sextant, a fixth part of certain things. The Romans having divided their *as* into 12 ounces or unciæ, the fixth part of that, or two ounces, was the fextans.—*Sextans* was alfo a meafure which contained two ounces of liquor, or two cyathi.

Sextans, in aftronomy, a conftellation of the fouthern hemifphere made by Hevelius out of unformed ftars. In Hevelius's catalogue it contains 11, but in the Britannic catalogue 41 ftars.

SEXTANT, in mathematics, denotes the fixth part of a circle, or an arch comprehending 60 degrees.

The word *fextant* is more particularly ufed for an aftronomical inftrument made like a quadrant, excepting that its limb only comprehends 60 degrees. The ufe and application of the fextant is the fame with that of the quadrant. See Quadrant; and Navigation, p. 737, &c.

SEXTILE, *fextilis*, the pofition or afpect of two planets when at 60 degrees diftance, or at the diftance of two figns from one another. It is marked thus (*). See Aspect.

SEXTIUS (Quintus), a Pythagorean philofopher, flourifhed in the time of Auguftus. He feemed formed to rife in the republic; but he fhrunk from civil honours, and declined accepting the rank of fenator when it was offered him by Julius Cæfar, that he might have time to apply to philofophy. It appears that he wifhed to eftablifh a fchool at Rome, and that his tenets, though chiefly drawn from the doctrines of Pythagoras, in fome particulars refembled thofe of the Stoics.

He foon found himfelf involved in many difficulties. His laws were tinctured with great feverity; and in an early period of his eftablifhment, he found his mind fo haraffed, and the harfhnefs of the doctrines which he wifhed to eftablifh fo repulfive to his feelings, that he had nearly worked himfelf up to fuch a height of defperation as to refolve on putting a period to his exiftence.

Of the fchool of Sextius were Fabianus, Sotion, Flavianus, Craffitius, and Celfus. Of his works only a few fragments remain; and whether any of them formed a part of the work which Seneca admired fo much, cannot now be determined. Some of his maxims are valuable. He recommended an examination of the actions of the day to his fcholars when they retired to reft; he taught, that the road to Heaven *(ad aftra)* was by frugality, temperance, and fortitude. He ufed to recommend holding a looking-glafs before perfons difordered with paffion. He enjoined his fcholars to abftain from animal food.

SEXTON, a church-officer, thus called by corruption of the Latin *facrifta*, or Saxon *fegerftone*, which denotes the fame. His office is to take care of the veffels, veftments, &c. belonging to the church; and to attend the minifter, church-warden, &c. at church. He is ufually chofen by the parfon only. Sextons, as well as parifh-clerks, are regarded by the common law as perfons who have freehold in their offices; and, therefore, though they may be punifhed, yet they cannot be deprived, by ecclefiaftical cenfures.

The office of fexton in the pope's chapel is appropriated to the order of the hermits of St Auguftine. He is generally a bifhop, though fometimes the pope only gives a bifhopric, *in partibus*, to him on whom he confers the poft. He takes the title of *Prefect of the Pope's Sacrifty*, and has the keeping the veffels of gold and filver, the relics, &c. When the pope fays mafs, the fexton always taftes the bread and wine firft. If it be in private he fays mafs, his holinefs, of two wafers, gives him one to eat; and, if in public, the cardinal, who affifts the pope in quality of deacon, of three wafers, gives him two to eat. When the pope is defperately fick, he adminifters to him the facrament of extreme unction, &c. and enters the conclave in quality of firft conclavift.

The office of a fexton in Sweden is fomewhat fingular. During M. Outhier's ftay at Stockholm in 1736 he vifited the church of St Clara, and during divine fervice he obferved a fexton going about with a long rod, waking thofe perfons who had fallen afleep.

SEXTUPLE, in mufic, denotes a mixed fort of triple, which is beaten in double time.

SEXTUS Empiricus, a famous Pyrrhonian philofopher, lived in the fecond century, under the reign of Antoninus Pius. He was a phyfician of the fect of the Empirics, and is faid to have been one of the preceptors of Antoninus the Philofopher. There are ftill extant his Pyrrhonian Inftitutions, and a large work againft the mathematicians, &c. The beft edition of Sextus Empiricus is that of Fabricius in Greek and Latin, printed at Leipfic in 1718, folio.

SEXUALISTÆ,

SEXUALISTÆ, among botanical writers, those who have established the classes of plants upon the differences of the sexes and parts of fructification in plants, according to the modern method; as Linnæus, &c.

SEZAWUL, a Hindoo word, used in Bengal to express an officer employed at a monthly salary to collect the revenues.

SFORZA (James), was the founder of the illustrious house of Sforza, which acted so conspicuous a part in Italy during the 15th and 16th centuries, which gave six dukes to Milan, and contracted alliances with almost every sovereign in Europe. James Sforza was born on the 28th of May 1369, at Catignola, a small town in Italy, lying between Imola and Faenza. His father was a day-labourer, or, according to Commines, a shoemaker. A company of soldiers happening one day to pass through Catignola, he was seized with the desire of accompanying them to the wars. "I will go (said he to himself), and dart my hatchet against that tree, and if it stick fast in the wood, I will immediately become a soldier." The hatchet accordingly stuck fast, and our adventurer enlisted; and because, says the Abbé deChoisi, he had thrown the axe with all his force, he assumed the name of Sforza; for his true name was Giacomuzzo, or James Attendulo. He rose rapidly in the army, and soon became commander of 7000 men. He defended the cause of Jane II. queen of Naples for many years, and was made constable of her kingdom. He was created count of Catignola by Pope John XXII. by way of paying a debt of 14000 ducats which the church of Rome owed him. His exploits became every day more illustrious: he obliged Alphonso king of Arragon to raise the siege of Naples; and reduced several places that had revolted in Abruzzo and Le Labour; but while in pursuit of his enemies he was unfortunately drowned in the river Aterno on the 3d January 1424, at the age of 54 years. His heroic qualities and the continual wars in which he was engaged, did not hinder him from forming an attachment to the fair sex. In his youth he fell in love with a woman called *Lucia Trezana*, whom he married after she had born him several children. He married afterwards Antoinette Salembini, who brought him several excellent estates; she bore him Bosio Sforza, count of Santa-Flor, a warrior and governor of Orvietta for Pope Martin V. His third wife was Catharine Alopa, sister of Rodolpho, grand chamberlain to the sovereign of Naples. His last wife, for he was four times married, was Mary Marzana, daughter to the duke of Sessa. She bore him Charles Sforza, who was general of the order of Augustines, and archbishop of Milan.

Sforza (Francis), the son of James Sforza by Lucia Trezana, was born in 1401, and trained up by his father to the profession of arms. At the age of 23 he defeated the troops of Braccio, who disputed with him the passage of the Aterno. In this action his father was drowned, and Francis, though illegitimate, succeeded him. He fought successfully against the Spaniards, and contributed a great deal both towards raising the siege of Naples, and to the victory which was gained over the troops of Braccio near Aquila in 1425, where that general was killed. After the death of Queen Jane, in 1435, he espoused the interests of the duke of Anjou, to whom she had left her crown, and by his courage and abilities ably supported that unfortunate prince. He made himself master of several places in Ancona, from which he was driven by Pope Eugenius IV. who defeated and excommunicated him; but he soon re-established his affairs by a victory. His reputation was now so great that the pope, the Venetians, and the Florentines, chose him for their general against the duke of Milan. Sforza had already conducted Venetian armies against that prince, though he had espoused his daughter. The duke dying in 1447, the inhabitants of Milan invited Sforza, his son-in-law, to lead them against that duke. But, after some exertions in their favour, he turned his arms against themselves, laid siege to Milan, and obliged them to receive him as duke, notwithstanding the rights of Charles duke of Orleans, the son of Valentine of Milan. In 1464, Louis XI. who hated Orleans, gave up to Sforza the rights which the crown of France had over Genoa, and even put into his hands Savona, a town belonging to that republic. The duke of Milan soon after made himself master of Genoa. He died in 1466, with the reputation of a man who was willing to sell his blood to the best purchaser, and who was not too scrupulous an observer of his word. His second wife was Blanche Marie, natural daughter of Philip Marie duke of Milan. She bore him Galeas Marie, and Ludovic Marie, dukes of Milan, Philip Marie count of Pavia, Sforza Marie duke of Bari, Ascagne Marie bishop of Pavia and Cremona, and a cardinal. He was taken prisoner by the troops of Louis XII. and confined for some time in the tower of Bourges. He was a cunning man, and deceived Cardinal d'Amboise when that prelate aspired at the papacy. His daughters were Hyppolita, married to Alphonso of Arragon, afterwards king of Naples; and Elizabeth, married to William marquis of Montferrat. He had besides several natural children.

SHACK, in ancient customs, a liberty of winter-pasturage. In the counties of Norfolk and Suffolk, the lord of the manor has shack, i. e. a liberty of feeding his sheep at pleasure in his tenants lands during the six winter months. In Norfolk, shack also extends to the common for hogs, in all men's grounds, from the end of harvest till feed-time. Whence to go *a-shack*, is to feed at large.

SHACKLES, aboard a ship, are those oblong iron rings, bigger at one end than at the other, with which the ports are shut fast, by thrusting the wooden bar of the port through them. There is also a sort of shackles to lift the hatches up with, of a like figure, but smaller. They are fastened at the corners of the hatches.

SHAD, in ichthyology, a species of Clupea.

SHADDOCK, a species of Citrus.

SHADOW, in optics, a privation or diminution of light by the interposition of an opake body: or it is a plane where the light is either altogether obstructed, or greatly weakened by the interposition of some opake body between it and the luminary.

Shadow, in painting, an imitation of a real shadow effected by gradually heightening and darkening the colours of such figures as by their dispositions cannot receive any direct rays from the luminary that is supposed to enlighten the piece.

Shadow, in perspective, the appearance of an opake body, and a luminous one, whose rays diverge (*e. gr.* a candle, lamp, &c.), being given; to find the just appearance

pearance of the ſhadow, according to the laws of perſpective. The method is this: From the luminous body, which is here conſidered as a point, let fall a perpendicular to the perſpective plane or table; *i. e.* find the appearance of a point upon which a perpendicular, drawn from the middle of the luminary, falls on the perſpective plane; and from the ſeveral angles, or raiſed points of the body, let fall perpendiculars to the plane. Theſe points, whereon the perpendiculars fall, connect by right lines, with the point upon which the perpendicular let fall from the luminary falls; and continue the lines to the ſide oppoſite to the luminary. Laſtly, Through the raiſed points draw lines through the centre of the luminary, interſecting the former; the points of interſection are the terms or bounds of the ſhadow.

SHADWELL (Thomas), deſcended of an ancient family in Staffordſhire, was born in 1640, and educated at Caius college, Cambridge. He then was placed in the Middle Temple to ſtudy the laws; where having ſpent ſome time, he travelled abroad. Upon his return home, he became acquainted with the moſt celebrated perſons of wit in that age. He applied himſelf chiefly to dramatic writing, in which he had great ſucceſs; and upon the Revolution was made poet laureat and hiſtoriographer to King William and Queen Mary, in the room of Mr Dryden. Theſe employments he enjoyed till his death, which happened in 1692. Beſide his dramatic writings, he compoſed ſeveral other pieces of poetry; the chief of which are his congratulatory poem on the prince of Orange's coming to England; another on Queen Mary; his tranſlation of Juvenal's 10th ſatire, &c. Mr Dryden treats him with great contempt, in his ſatire called *Mac-Flecknoe*. The beſt judges of that age, however, gave their teſtimony in favour of his comedies; which have in them fine ſtrokes of humour; the characters are often original, ſtrongly marked, and well ſuſtained. An edition of his works, with ſome account of his life and writings prefixed, was publiſhed in 1720, in 4 vols. 8vo.

SHAFT *of a* COLUMN, in building, is the body thereof between the baſe and capital; ſo called from its ſtraightneſs. See ARCHITECTURE.

SHAFT, in mining, is the pit or hollow entrance into the mine. In the tin mines, after this is ſunk about a fathom, they leave a little, long, ſquare place, which is called a *ſhamble*.

Shafts are ſunk ſome ten, ſome twenty fathoms deep into the earth, more or leſs. Of theſe ſhafts, there is the landing or working ſhaft, where they bring up the work or ore to the ſurface; but if it be worked by a horſe engine or whim, it is called a *whim-ſhaft*; and where the water is drawn out of the mine, it is indifferently named an *engine-ſhaft*, or the *rod-ſhaft*. See MINE.

SHAFT, in ornithology. See TROCHILUS.

SHAFTESBURY, a town of Dorſetſhire in England, in W. Long. 2. 20. N. Lat. 51. 0. It ſtands on a high hill, and is built in the form of a bow. It enjoys a ſerene wholeſome air, and has a fine proſpect. It is a good thoroughfare, is governed by a mayor, and ſends two members to parliament. This town is ſuppoſed to have been built in the 8th century, and to have been enlarged by King Alfred, and had 12 churches, beſides a Benedictine monaſtery, in the time of the Saxons, but has now only three. St Edward the martyr was buried here. It had three mints before the Conqueſt, and, in the reign of Henry VIII. was the ſee of a ſuffragan biſhop. It was incorporated by Queen Elizabeth and Charles II. and is governed by a mayor, recorder, twelve aldermen, bailiffs, and a common council. It contains about 320 houſes, many of which are of freeſtone. Water is ſo ſcarce, that it uſed to be ſupplied from Motcomb; but it was obtained more commodiouſly in 1718, by means of engines, which raiſed the water above 300 feet perpendicular, and conveyed it to a large ciſtern in the middle of the town, from the diſtance of two miles. Yet even this is laid aſide, and they have dug ſeveral pits, in which they preſerve the rain water; and the poor get their living to this day by fetching it in pails or on horſes. It gives the title of earl to the noble family of Cooper.

SHAFTESBURY (earl of). See COOPER.

SHAG, in ornithology. See PELICANUS.

SHAGREEN, or CHAGREEN, in commerce, a kind of grain leather prepared of the ſkin of a ſpecies of SQUALUS, much uſed in covering caſes, books, &c.

Manner of preparing SHAGREEN. The ſkin, being flayed off, is ſtretched out, covered over with muſtard ſeed, and the ſeed bruiſed on it; and thus it is expoſed to the weather for ſome days, and then tanned.

The beſt is that brought from Conſtantinople, of a browniſh colour; the white is the worſt. It is extremely hard; yet, when ſteeped in water, it becomes very ſoft and pliable; whence it is of great uſe among caſe-makers. It takes any colour that is given it, red, green, yellow, or black. It is frequently counterfeited by morocco, formed like ſhagreen; but this laſt is diſtinguiſhed by its peeling off, which the firſt does not.

SHAIK properly ſignifies an old man. In the eaſt it is uſed to denote a lord or chief, a man of eminence and property. See SCHIECHS.

SHAKE, in ſinging. See TRILL.

SHAKESPEARE or SHAKSPEARE (William), the prince of dramatic writers, was born at Stratford upon Avon in Warwickſhire, on the 23d of April 1564. From the regiſter of that town, it appears that a plague broke out there on the 30th of June following, which raged with great violence; but fortunately it did not reach the houſe in which this infant prodigy lay. His father, John Shakeſpeare, enjoyed a ſmall patrimonial eſtate, and was a conſiderable dealer in wool; his mother was the daughter and heireſs of Robert Arden of Wellingcote. Our illuſtrious poet being deſigned for the buſineſs of his father, received no better education than the inſtructions which the free ſchool of Stratford could afford. After applying ſome time to the ſtudy of Latin, he was called home to aſſiſt his father, who ſeems by ſome accident to have been reduced in his circumſtances. Before arriving at the age of 19, he married the daughter of Mr Hathaway, a ſubſtantial yeoman in the neighbourhood of Stratford. This lady was eight years older than her huſband. Having the misfortune to fall into bad company, he was ſeduced into ſome profligate actions, which drew on him a criminal proſecution, and at length forced him to take refuge in the capital. In concert with his aſſociates, he broke into a park belonging to Sir Thomas Lucy of Charlecote, and carried off ſome of his deer. Every admirer of Shakeſpeare will regret that ſuch a blemiſh ſhould have ſtained his character:

Shakespeare.

but, perhaps, if any thing can extenuate his guilt, we might ascribe it to the opinions of the age, which, perhaps, as was formerly the case in Scotland, might not distinguish the killing of deer by any mark of disgrace, or any charge of criminality. One thing at least is certain, that Shakespeare himself thought that the prosecution which Sir Thomas raised against him was carried on with too great severity; an opinion which he could not have entertained had this action been at that time viewed in the same criminal light as it is at present. Shakespeare testified his resentment against Sir Thomas, by writing a satirical ballad, which exasperated him so much, that the process was carried on with redoubled violence; and the young poet, in order to avoid the punishment of the law, was obliged to make his escape. This ballad would be considered as a curious relic, on account of its being the first production of Shakespeare; it would also be interesting to peruse a poem which could irritate the baronet to so high a degree. Tradition has preserved the first stanza:

A parliamente member, a justice of peace,
At home a poor scare-crow, at London an asse.
If lowsie is Lucy, as some volke miscalle it,
Then Lucy is lowsie whatever befall it:
He thinks himself greate,
Yet an asse in his state,
We allowe by his ears, but with asses to mate.
If Lucy is lowsie, as some volke miscalle it,
Sing lowsie Lucy whatever befall it.

If the rest of the ballad was of a piece with this stanza, it might assist us to form some opinion of the irritability of the baronet, but will enable us to form no idea of the opening genius of Shakespeare.

Thus expelled from his native village, he repaired to London, where he was glad to accept a subordinate office in the theatre. It has been said that he was first engaged, while the play was acting, in holding the horses of those who rode to the theatre: but this story rests on a slender foundation. As his name is found printed among those of the other players before some old plays, it is probable that he was some time employed as an actor; but we are not informed what characters he played; we are only told, that the part which he acted best was that of the Ghost in Hamlet; and that he appeared in the character of Adam in *As you Like it*. If the names of the actors prefixed to Ben Jonson's play of *Every Man in his Humour* were arranged in the same order as the persons represented, which is very probable, Shakespeare played the part of Old Knowell. We have reason therefore to suppose, as far as we can argue from these few facts, that he generally represented old men. See Malone's Chronology, in his edition of Shakespeare.

But though he was not qualified to shine as an actor, he was now in the situation which could most effectually rouse those latent sparks of genius which afterwards burst forth with so resplendent a flame. Being well acquainted with the mechanical business of the theatre and the taste of the times; possessed of a knowledge of the characters of men resembling intuition, an imagination that ranged at large through nature, selecting the grand, the sublime, and the beautiful; a judicious caution, that disposed him to prefer those plots which had already been found to please; an uncommon fluency and force of expression; he was qualified at once to eclipse all who had gone before him.

Notwithstanding the unrivalled genius of Shakespeare, most of his plots were the invention of others; which, however, he certainly much improved, if he did not entirely new-model. We are assured, that prior to the theatrical compositions of Shakespeare, dramatic pieces were written on the following subjects, viz. King John, King Richard II. and III. King Henry IV. and V. King Henry VIII. King Lear, Antony and Cleopatra, Measure for Measure, the Merchant of Venice, the Taming of a Shrew, and the Comedy of Errors.

Among his patrons, the earl of Southampton is particularly honoured by him, in the dedication of two poems, Venus and Adonis, and Lucrece; in the latter especially, he expressed himself in such terms as gives countenance to what is related of that patron's distinguished generosity to him. In the beginning of King James I.'s reign (if not sooner) he was one of the principal managers of the playhouse, and continued in it several years afterwards; till, having acquired such a fortune as satisfied his moderate wishes and views in life, he quitted the stage, and all other business, and passed the remainder of his time in an honourable ease, at his native town of Stratford, where he lived in a handsome house of his own purchasing, to which he gave the name of *New Place;* and he had the good fortune to save it from the flames in the dreadful fire that consumed the greatest part of the town in 1614.

In the beginning of the year 1616, he made his will, wherein he testified his respect to his quondam partners in the theatre: he appointed his youngest daughter, jointly with her husband, his executors, and bequeathed to them the best part of his estate, which they came into the possession of not long after. He died on the 23d of April following, being the 53d year of his age; and was interred among his ancestors on the north side of the chancel, in the great church of Stratford, where there is a handsome monument erected for him, inscribed with the following elegiac distich in Latin:—

Judicio Pylium, genio Socratem, arte Maronem,
Terra tegit, Populus mæret, Olympus habet.

In the year 1740, another very noble one was raised to his memory, at the public expence, in Westminster Abbey; an ample contribution for this purpose being made upon exhibiting his tragedy of Julius Cæsar, at the theatre-royal in Drury-Lane, April 28. 1738.

Nor must we omit mentioning another testimony of the veneration paid to his manes by the public in general, which is, that a mulberry tree planted upon his estate by the hands of this revered bard, was cut down not many years ago; and the wood being converted to several domestic uses, was all eagerly bought at a high price, and each single piece treasured up by its purchaser as a precious memorial of the planter.

The character of Shakespeare as a dramatic writer has been often drawn, but perhaps never with more accuracy than by the pen of Dr Johnson: "Shakespeare (says he) is above all writers, at least above all modern writers, the poet of nature; the poet that holds up to his readers a faithful mirror of manners and of life.

His

Shakeſpeare.

His characters are not modified by the cuſtoms of particular places, unpractiſed by the reſt of the world; by the peculiarities of ſtudies or profeſſions, which can operate but upon ſmall numbers; or by the accidents of tranſient faſhions or temporary opinions: they are the genuine progeny of common humanity, ſuch as the world will always ſupply, and obſervation will always find. His perſons act and ſpeak by the influence of thoſe general paſſions and principles by which all minds are agitated, and the whole ſyſtem of life is continued in motion. In the writings of other poets, a character is too often an individual; in thoſe of Shakeſpeare, it is commonly a ſpecies.

" It is from this wide extenſion of deſign that ſo much inſtruction is derived. It is this which fills the plays of Shakeſpeare with practical axioms and domeſtic wiſdom. It was ſaid of Euripides, that every verſe was a precept; and it may be ſaid of Shakeſpeare, that from his works may be collected a ſyſtem of civil and economical prudence. Yet his real power is not ſhown in the ſplendour of particular paſſages, but by the progreſs of his fable, and the tenor of his dialogue; and he that tries to recommend him by ſelect quotations, will ſucceed like the pedant in Hierocles, who, when he offered his houſe to ſale; carried a brick in his pocket as a ſpecimen.

" Upon every other ſtage the univerſal agent is love, by whoſe power all good and evil is diſtributed, and every action quickened or retarded. But love is only one of many paſſions; and as it has no great influence upon the ſum of life, it has little operation in the dramas of a poet who caught his ideas from the living world, and exhibited only what he ſaw before him. He knew that any other paſſion, as it was regular or exorbitant, was a cauſe of happineſs or calamity.

" Characters thus ample and general were not eaſily diſcriminated and preſerved; yet perhaps no poet ever kept his perſonages more diſtinct from each other.

" Other dramatiſts can only gain attention by hyperbolical or aggravated characters, by fabulous and unexampled excellence or depravity, as the writers of barbarous romances invigorated the reader by a giant and a dwarf; and he that ſhould form his expectations of human affairs from the play, or from the tale, would be equally deceived. Shakeſpeare has no heroes, his ſcenes are only occupied by men, who act and ſpeak as the reader thinks that he ſhould himſelf have ſpoken or acted on the ſame occaſion: Even where the agency is ſupernatural, the dialogue is level with life. Other writers diſguiſe the moſt natural paſſions and moſt frequent incidents; ſo that he who contemplates them in the book will not know them in the world: Shakeſpeare approximates the remote, and familarizes the wonderful; the event which he repreſents will not happen, but if it were poſſible, its effects would probably be ſuch as he has aſſigned; and it may be ſaid, that he has not only ſhown human nature as it acts in real exigencies, but as it would be found in trials to which it cannot be expoſed.

" This therefore is the praiſe of Shakeſpeare, that his drama is the mirror of life; that he who has mazed his imagination, in following the phantoms which other writers raiſe up before him, may here be cured of his delirious ecſtaſies, by reading human ſentiments in human language; by ſcenes from which a hermit may eſtimate the tranſactions of the world, and a confeſſor predict the progreſs of the paſſions."

The learning of Shakeſpeare has frequently been a ſubject of inquiry. That he poſſeſſed much claſſical knowledge does not appear, yet he was certainly acquainted with the Latin poets, particularly with Terence, as Colman has juſtly remarked, which appears from his uſing the word *thraſonical.* Nor was he unacquainted with French and Italian. We are indeed told, that the paſſages in which theſe languages occur might be impertinent additions of the players; but is it probable, that any of the players ſo far ſurpaſſed Shakeſpeare?

That much knowledge is ſcattered over his works is very juſtly obſerved by Pope; but it is often ſuch knowledge as books did not ſupply. " There is, however, proof enough (ſays Dr Johnſon) that he was a very diligent reader; nor was our language then ſo indigent of books, but that he might very liberally indulge his curioſity without excurſion into foreign literature. Many of the Roman authors were tranſlated, and ſome of the Greek; the Reformation had filled the kingdom with theological learning; moſt of the topics of human diſquiſition had found Engliſh writers; and poetry had been cultivated, not only with diligence, but ſucceſs. This was a ſtock of knowledge ſufficient for a mind ſo capable of appropriating and improving it."

The works of Shakeſpeare conſiſt of 35 dramatic pieces. The following is the chronological order which Mr Malone has endeavoured to eſtabliſh, after a minute inveſtigation, in which he has in general been ſucceſsful:

1. Firſt Part of King Henry VI. -	1589
2. Second Part of King Henry VI. -	1591
3. Third Part of King Henry VI. -	1591
4. A Midſummer Night's Dream -	1592
5. Comedy of Errors - -	1593
6. Taming of the Shrew - -	1594
7. Love's Labour Loſt - -	1594
8. Two Gentlemen of Verona - -	1595
9. Romeo and Juliet - -	1595
10. Hamlet - -	1596
11. King John - -	1596
12. King Richard II. - -	1597
13. King Richard III. - -	1597
14. Firſt Part of King Henry IV. -	1597
15. Second Part of King Henry IV. -	1598
16. The Merchant of Venice - -	1598
17. All's Well that Ends Well -	1598
18. King Henry V. - - -	1599
19. Much Ado About Nothing -	1600
20. As You Like It - - -	1600
21. Merry Wives of Windſor -	1601
22. Hing Henry VIII. - -	1601
23. Troilus and Creſſida - -	1602
24. Meaſure for Meaſure - -	1603
25. The Winter's Tale - -	1604
26. King Lear - - -	1605
27. Cymbelline - - -	1605
28. Macbeth - - -	1606
29. Julius Cæſar - - -	1607
30. Antony and Cleopatra - -	1608
31. Timon of Athens - -	1609
32. Coriolanus - - -	1610

33. Othello

Shakespeare.

33. Othello - - - - 1611
34. The Tempest - - - - 1612
35. Twelfth Night - - - - 1614

The three first of these, Mr Malone thinks, there is very strong reason to believe are not the original productions of Shakespeare; but that he probably altered them, and added some new scenes.

In the first folio edition in 1623, these plays were entitled "Mr William Shakespeare's Comedies, Histories, and Tragedies." They have been published by various editors. The first folio edition by Isaac Jaggard and Edward Blount; the second, folio, 1632, by Thomas Cotes for Robert Allot; the third, 1664, for P. C.; the fourth, 1685, for H. Herringman, E. Brewster, and R. Bentley. Rowe published an 8vo edition in 1709, in 7 vols. and a 12mo edition in 1714, in 9 vols.; for which he received 36l. 10s. Pope published a 4to edition in 1725, in 6 vols. and a 12mo in 1728, in 10 vols.; for which he was paid 217l. 12s. Theobald gave a new edition in 8vo in 1733, in 7 vols. another in 12mo in 1740, in 8 vols.; and received for his labour 652l. 10s. Sir Thomas Hanmer published an edition in 1744, in 6 vols. 4to. Dr Warburton's 8vo edition came out in 1747, in 8 vols.; for which he was paid 560l. The editions published since that time, are Dr Johnson's in 1765, in 8 vols. 8vo. Stevens's in 1766, in 4 vols. 8vo. Capell's in 1768, in 10 vols. crown 8vo; for this the author was paid 300l. A second edition of Hammer's in 1771, 6 vols. Johnson's and Stevens's in 1773, in 10 vols. 8vo; a second edition in 1778; a third by Reed in 1785; and Malone's crown 8vo edition in 1789, in 10 vols.

The most authentic of the old editions is that of 1623. "At last (says Dr Johnson) an edition was undertaken by Rowe; not because a poet was to be published by a poet, for Rowe seems to have thought very little on correction or explanation, but that our author's works might appear like those of his fraternity, with the appendages of a life and recommendatory preface. Rowe has been clamourously blamed for not performing what he did not undertake, and it is time that justice be done him, by confessing, that though he seems to have had no thoughts of corruption beyond the printer's errors, yet he has made many emendations, if they were not made before, which his successors have received without acknowledgment, and which, if they had produced them, would have filled pages with censures of the stupidity by which the faults were committed, with displays of the absurdities which they involved, with ostentatious expositions of the new reading, and self-congratulations on the happiness of discovering it."

The nation had been for many years content enough with Mr Rowe's performance, when Mr Pope made them acquainted with the true state of Shakespeare's text, showed that it was extremely corrupt, and gave reason to hope that there were means of reforming it. Mr Pope's edition, however, he observes, fell below his own expectations; and he was so much offended, when he was found to have left any thing for others to do, that he passed the latter part of his life in a state of hostility with verbal criticism.

The only task in the opinion of Mr Malone, for which Pope was eminently and indisputably qualified, was to mark the faults and beauties of his author.—When he undertook the office of a commentator, every anomaly of language, and every expression that was currently in use, were considered as errors or corruptions, and the text was altered or amended, as it was called, at pleasure. Pope is openly charged with being one of the great corrupters of Shakespeare's text.

Pope was succeeded by Theobald, who collated the ancient copies, and rectified many errors. He was however, a man of narrow comprehension and of little learning, and what is worse, in his report of copies and editions, he is not to be trusted without examination. From the liberties taken by Pope, the edition of Theobald was justly preferred, because he professed to adhere to the ancient copies more strictly, and illustrated a few passages by extracts from the writers of our poet's age. Still, however, he was a considerable innovator; and while a few arbitrary changes made by Pope were detected, innumerable sophistications were silently adopted.

Sir Thomas Hanmer, who comes next, was a man of critical abilities, and of extensive learning. His corrections are commonly just, but sometimes capricious. He is censurable, too, for receiving without examination almost all the innovations of Pope.

The original and predominant error of Warburton's commentary, is acquiescence in his first thoughts; that precipitation which is produced by consciousness of quick discernment; and that confidence which presumes to do, by surveying the surface, what labour only can perform, by penetrating to the bottom. His notes exhibit sometimes perverse interpretations, and sometimes improbable conjectures; he at one time gives the author more profundity of meaning than the sentence admits, and at another discovers absurdities where the sense is plain to every other reader. But his emendations are likewise often happy and just; and his interpretation of obscure passages learned and sagacious.

It has indeed been said by his defenders, that his great object was to display his own learning; and certainly, in spite of the clamour raised against him for substituting his own chimerical conceits instead of the genuine text of Shakespeare, his work increased his reputation. But as it is of little value as a commentary on Shakespeare, since Warburton is now gone, his work will probably soon sink into oblivion.

In 1765 Dr Johnson's edition, which had long been impatiently expected, was given to the public. His vigorous and comprehensive understanding threw more light on his author than all his predecessors had done. The character which he gave of each play is generally just. His refutation of the false glosses of Theobald and Warburton, and his numerous explications of involved and difficult passages, entitle him to the gratitude of every admirer of Shakespeare.

The last editor is Mr Malone, who was eight years employed in preparing his edition. By collating the most authentic copies, he has been careful to purify the text. He has been so industrious, in order to discover the meaning of the author, that he has ransacked many volumes, and trusts that, besides his additional illustrations, not a single valuable explication of any obscure passage in these plays has ever appeared, which he has not inserted in his edition. He rejects Titus Andronicus, as well as the three plays formerly mentioned, as not

not being the authentic productions of Shakespeare. To the whole he has added an appendix, and a copious glossary. Of this work a less expensive edition has been published in 7 vols. 12mo, in which the general introductory observations prefixed to the different plays are preserved, and the numerous notes abridged.

This judicious commentator has certainly done more for the elucidation and correction of Shakespeare than all who came before him, and has followed with indefatigable patience the only road which a commentator of Shakespeare ought to observe.

Within 50 years after our poet's death, Dryden says that he was become "a little obsolete;" and in the beginning of the present century Lord Shaftesbury complains of his rude unpolished style, and his antiquated phrase and wit. These complaints were owing to the great revolution which the English language has undergone, and to the want of an enlightened commentator. These complaints are now removed, for an enlightened commentator has been found in Mr Malone.

We have only farther to add, that in the year 1790 a copious index to the remarkable passages and words in the plays of Shakespeare was published by the Reverend Mr Ayscough; a gentleman to whom the literary world is much indebted for several very valuable keys of knowledge. In fine, the admirers of Shakespeare are now, by the labours of several eminent men, furnished with every help that can enable them to understand the sense and to taste the beauties of this illustrious poet.

SHAKLES. See SHACKLES.

SHALE, in natural history, a species of SCHISTUS. It is a black slaty substance, or a clay hardened into a stony consistence, and so much impregnated with bitumen that it becomes somewhat like a coal. The acid emitted from shale, during its calcination, uniting itself to the argillaceous earth of the shale, forms alum. About 120 tons of calcined shale will make one ton of alum. The shale, after being calcined, is steeped in water, by which means the alum, which is formed during the calcination of the shale, is dissolved: this dissolved alum undergoes various operations before it is formed into the alum of the shops. Watson's Chemical Essays, Vol. II. p. 315. See ALUM.

This kind of slate forms large strata in Derbyshire; and that which lies near the surface of the earth is of a softer and more shivery texture than that which lies deeper. It is also found in large strata, generally above the coal, in most coal counties of this kingdom. Dr Short informs us, that the shale wastes the lead ore near it, by its strong acid; and that it corrodes and destroys all minerals near it except iron or coal, of whose vitriol it partakes.

SHALLOP, SHALLOOP, or SLOOP, is a small light vessel, with only a small main-mast, and fore-mast, and lug-sails, to hale up, and let down, on occasion.—Shallops are commonly good sailors, and are therefore often used as tenders upon men of war.

SHALLOT, or ESCHALOT. See ALLIUM.

SHAMANS are wizards or conjurers, in high repute among several idolatrous nations inhabiting different parts of Russia. By their enchantments they pretend to cure diseases, to divert misfortunes, and to foretel futurity. They are great observers of dreams, by the interpretation of which they judge of their good or bad fortune. They pretend likewise to chiromancy, and to foretel a man's good or ill success by the lines of his hand. By these and such like means they have a very great ascendency over the understandings, and a great influence on the conduct, of those people.

SHAMBLES, among miners, a sort of niches or landing places, left at such distances in the adits of the mines, that the shovel-men may conveniently throw up the ore from shamble to shamble, till it comes to the top of the mine.

SHAMOIS, CHAMOIS, or SHAMMY, a kind of leather, either dressed in oil or tanned, much esteemed for its softness, pliancy, &c. It is prepared from the skin of the chamois, or shamois, a kind of rupicapra, or wild goat, called also isard, inhabiting the mountains of Dauphiny, Savoy, Piedmont, and the Pyrenees. Besides the softness and warmth of the leather, it has the faculty of bearing soap without damage; which renders it very useful on many accounts.

In France, &c. some wear the skin raw, without any preparation. Shammy leather is used for the purifying of mercury, which is done by passing it through the pores of this skin, which are very close. The true chamois leather is counterfeited with common goat, kid, and even with sheep-skins, the practice of which makes a particular profession, called by the French *chamoisure*. The last, though the least esteemed, is yet so popular, and such vast quantities of it are prepared, especially about Orleans, Marseilles, and Thoulouse, that it may not be amiss to give the method of preparation.

Manner of shamoising, or of preparing sheep, goat, or kid skins in oil, in imitation of shammy. The skins, being washed, drained, and smeared over with quicklime on the fleshy side, are folded in two lengthwise, the wool outwards, and laid on heaps, and so left to ferment eight days, or, if they had been left to dry after flaying, then fifteen days.

Then they are washed out, drained, and half dried; laid on a wooden leg, or horse, the wool stripped off with a round staff for that purpose, and laid in a weak pit, the lime whereof had been used before, and has lost the greatest part of its force.

After 24 hours they are taken out, and left to drain 24 more; they are then put in another stronger pit. This done, they are taken out, drained, and put in again, by turns; which begins to dispose them to take oil; and this practice they continue for six weeks in summer, or three months in winter: at the end whereof they are washed out, laid on the wooden leg, and the surface of the skin on the wool side peeled off, to render them the softer; then made into parcels, steeped a night in the river, in winter more, stretched six or seven over one another on the wooden leg, and the knife passed strongly on the flesh side, to take off any thing superfluous, and render the skin smooth. Then they are steeped, as before, in the river, and the same operation is repeated on the wool side; they are then thrown into a tub of water, with bran in it, which is brewed among the skins till the greatest part sticks to them, and then separated into distinct tubs, till they swell, and rise of themselves above the water. By this means the remains of the lime are cleared out; they are then wrung out, hung up to dry on ropes, and sent to the mill, with the quantity of oil necessary to scour them: the best oil is that of stock-fish. Here they are first thrown in

bundles

bundles into the river for 12 hours, then laid in the mill-trough, and fulled without oil till they be well softened; then oiled with the hand, one by one, and thus formed into parcels of four skins each; which are milled and dried on cords a second time; then a third; and then oiled again, and dried. This process is repeated as often as necessity requires; when done, if there be any moisture remaining, they are dried in a stove, and made up into parcels wrapped up in wool; after some time they are opened to the air, but wrapped up again as before, till such time as the oil seems to have lost all its force, which it ordinarily does in 24 hours. The skins are then returned from the mill to the chamoiser to be scoured: which is done by putting them in a lixivium of wood-ashes, working and beating them in it with poles, and leaving them to steep till the ley hath had its effect; then they are wrung out, steeped in another lixivium, wrung again: and this is repeated till all the grease and oil be purged out. When this is done, they are half dried, and passed over a sharp-edged iron instrument, placed perpendicular in a block, which opens, softens, and makes them gentle. Lastly, They are thoroughly dried, and passed over the same instrument again; which finishes the preparation, and leaves them in form of shammy.

Kid and goat skins are shamoised in the same manner as those of sheep, excepting that the hair is taken off without the use of any lime; and that when brought from the mill they undergo a particular preparation called *ramalling*, the most delicate and difficult of all the others. It consists in this, that, as soon as brought from the mill, they are steeped in a fit lixivium, taken out, stretched on a round wooden leg, and the hair is scraped off with the knife; this makes them smooth, and in working to cast a kind of fine knap. The difficulty is in scraping them evenly.

SHANK, or *Shank Painter*, in a ship, is a short chain fastened under the foremast shrouds by a bolt, to the ship's sides, having at the other end a rope fastened to it. On this shank painter the whole weight of the aft part of the anchor rests, when it lies by the ship's side. The rope, by which it is hauled up, is made fast about a timber head.

Shank, in the manege, that part of a horse's fore leg which lies between the knee and the fetlock.

SHANKER, or Chancre, in medicine, a malignant ulcer, usually occasioned by some venereal disorder. See Medicine, N° 350.

SHANNON, the largest river in Ireland, and one of the finest in the British dominions, not only on account of its rolling 200 miles, but also of its great depth in most places, and the gentleness of its current, by which it might be made exceedingly serviceable to the improvement of the country, the communication of its inhabitants, and consequently the promoting of inland trade, through the greatest part of its long course. But the peculiar prerogative of the Shannon is its situation, running from north to south, and separating the province of Connaught from Leinster and Munster, and of consequence dividing the greatest part of Ireland into what lies on the east and that on the west of the river; watering in its passage the valuable county of Leitrim, the plentiful shire of Roscommon, the fruitful county of Galway, and the pleasant county of Clare; the small but fine shire of Longford, the King's county, and fertile county of Meath in Leinster, the populous county of Tipperary, the spacious shire of Limerick, and the rough but pleasant county of Kerry in Munster; visiting 10 counties in its passage, and having on its banks the following remarkable places, viz. Leitrim, Jamestown, Lanesborough, Athlone, Clonfert, Killaloe, and Limerick; at 20 leagues below the latter it spreads gradually several miles in extent, so that some have considered its expansion as a lake. It at last joins its waters to the sea, being navigable all that way for the largest vessels.

SHANSCRIT, the language of the Bramins of Hindostan. See Philology, Sect. V.

SHARE *of a Plough*, that part which cuts the ground; the extremity forwards being covered with a sharp pointed iron, called the *point of the share*, and the end of the wood behind the *tail of the share*.

SHARK, in ichthyology. See Squalus.

SHARON, a name common to three cantons of Palestine. The first lay between Mount Tabor and the sea of Tiberias; the second between the city of Cæsarea of Palestine, and Joppa; and the third lay beyond Jordan. To give an idea of perfect beauty, Isaiah said, the glory of Lebanon and the beauty of Carmel must be joined to the abundance of Sharon, (Isaiah xxxiii. 9. xxxi. 2.) The plains of Sharon are of vast extent; and, when surveyed by the Abbé Mariti a few years ago, they were sown with cucumbers; and he informs us, that such a number is annually produced, as not only to supply the whole neighbourhood, but also all the coasts of Cyprus and the city of Damietta. In the middle of the plain, between Arsus and Lydda, rises a small mountain, upon the ridge of which there is a small village called Sharon, from the name of the ancient city whose king was conquered by Joshua.

SHARP (James), archbishop of St Andrew's, was born of a good family in Banffshire in 1618. He devoted himself very early to the church, and was educated for that purpose in the University of Aberdeen. When the solemn league and covenant was framed in 1638, the learned men in that seminary, and young Sharp in particular, declared themselves decidedly against it. To avoid the insults and indignities to which he was subjected in consequence of this conduct, he retired to England, where he contracted an acquaintance with some of the most celebrated divines in that country.

At the commencement of the civil wars he returned to Scotland. During his journey thither, he accidentally met with Lord Oxenford, who was so charmed with his conversation, that he invited him to his house. While he resided with that nobleman, he became known to the earl of Rothes, who procured him a professorship at St Andrew's. By the interest of the earl of Crawfurd he was soon after appointed minister of Crail; where he conducted himself, it is said, in an exemplary manner.

Sharp had always inclined to the cause of royalty, and had for some time kept up a correspondence with his exiled prince. After the death of the protector he began to declare himself more openly, and seems to have enjoyed a great share of the confidence of Monk, who was at that time planning the restoration of Charles II. When that general marched to London, the Presbyterians sent Sharp to attend him in order to support their interests. At the request of General Monk and the chief Presbyterians in Scotland, Mr Sharp was soon after

Sharp.

ter sent over to the king at Breda to procure from him, if possible, the establishment of Presbyterianism. On his return, he assured his friends that "he had found the king very affectionate to Scotland, and resolved not to wrong the settled government of the church: but he apprehended they were mistaken who went about to establish the Presbyterian government."

Charles was soon after restored without any terms. All the laws passed in Scotland since the year 1633 were repealed; the king and his ministers resolved at all hazards to restore Prelacy. Mr Sharp, who had been commissioned by the Scotch Presbyterians to manage their interests with the king, was prevailed upon to abandon the party; and, as a reward for his compliance, he was made archbishop of St Andrew's. This conduct rendered him very odious in Scotland; he was accused of treachery and perfidy, and reproached by his old friends as a traitor and a renegado. The absurd and wanton cruelties which were afterwards committed, and which were imputed in a great measure to the archbishop, rendered him still more detested. Nor is it probable that these accusations were without foundation: the very circumstance of his having been formerly of the Presbyterian party would induce him, after forsaking them, to treat them with severity. Besides, it is certain, that when after the rout at Pentland hills he received an order from the king to stop the executions, he kept it for some time before he produced it to council.

There was one Mitchell a preacher, and a desperate fanatic, who had formed the design of taking vengeance for these cruelties by assassinating the archbishop. He fired a pistol at him as he was sitting in his coach; but the bishop of Orkney, lifting up his hand at the moment, intercepted the ball. Though this happened in the midst of Edinburgh, the primate was so much detested, that nobody stopped the assassin; who, having walked leisurely home, and thrown off his disguise, returned, and mixed unsuspected with the crowd. Some years after, the archbishop observing a man eyeing him with keenness, suspected that he was the assassin, and ordered him to be brought before him. It was Mitchell. Two loaded pistols were found in his pocket. The primate offered him a pardon if he would confess the crime: the man complied: but Sharp, regardless of his promise, conducted him to the council. The council also gave him a solemn promise of pardon if he would confess his guilt, and discover his accomplices. They were much disappointed to hear that only one man was privy to his purpose, who was since dead. Mitchell was then brought before a court of justice, and ordered to make a third confession, which he refused. He was imprisoned for several years, and then tried. His own confession was urged against him. It was in vain for him to plead the illegality of that evidence, and to appeal to the promise of pardon previously given. The council took an oath that they had given no such promise; and Mitchell was condemned. Lauderdale, who at that time governed Scotland, would have pardoned him, but the primate insisted on his execution; observing, that if assassins were permitted to go unpunished, his life must be continually in danger. Mitchell was accordingly executed.

Sharp had a servant, one Carmichael, who by his cruelty had rendered himself particularly odious to the zealots. Nine men formed the resolution of waylaying him in Magus-muir, about three miles from St Andrew's. While they were waiting for this man, the primate himself appeared with very few attendants. This they looked upon as a declaration of heaven in their favour; and calling out, "the Lord has delivered him into our hands," they ran up to the carriage. They fired at him without effect; a circumstance which was afterwards imputed to magic. They then despatched him with their swords, regardless of the tears and entreaties of his daughter, who accompanied him (A).

Thus fell Archbishop Sharp, whose memory is even at present detested by the common people of Scotland. His abilities were certainly good, and in the early part of his life he appears with honour and dignity. But his conduct afterwards was too cruel and insincere to merit approbation. His treatment of Mitchell was mean and vindictive. How far he contributed to the measures adopted against the Presbyterians is not certain. They were equally cruel and impolitic; nor did their effects cease with the measures themselves. The unheard-of cruelties exercised by the ministers of Charles II. against the adherents of the covenant, raised such a flame of enthusiasm and bigotry as is not yet entirely extinguished.

Sharp (Dr John), archbishop of York, was descended from the Sharps of Little Norton, a family of Bradford Dale in Yorkshire; and was son of an eminent tradesman of Bradford, where he was born in 1644. He was educated at Cambridge, and in 1667 entered into orders. That same year he became domestic chaplain to Sir Heneage Finch, then attorney general. In 1672 he was collated to the archdeaconry of Berkshire. In 1675 he was installed a prebendary in the cathedral church of Norwich; and the year following was instituted into the rectory of St Bartholomew near the Royal Exchange, London. In 1681 he was, by the interest of his patron Sir Heneage Finch, then lord high chancellor of England, made dean of Norwich; but in 1686 was suspended for taking occasion, in some of his sermons, to vindicate the doctrine of the church of England in opposition to Popery. In 1688 he was sworn chaplain to King James II. being then probably restored after his suspension; for it is certain that he was chaplain to King Charles II. and attended as a court chaplain

(A) Such is the account given by all the historians of the murder of Archbishop Sharp; and that he fell by the hands of fanatics, whom he persecuted, is certain. A tradition, however, has been preserved in different families descended from him, which may be mentioned, and is in itself certainly not incredible. The primate, it seems, who, when minister of Crail, was peculiarly severe in punishing the sin of fornication, had, in the plenitude of his archiepiscopal authority, taken notice of a criminal amour carried on between a nobleman high in office and a lady of some fashion who lived within his diocese. This interference was in that licentious age deemed very impertinent; and the archbishop's descendants believe that the proud peer instigated the deluded rabble to murder their ancestor.

Sharp, Shaster.

plain at the coronation of King James II. In 1689 he was declared dean of Canterbury; but never could he persuaded to fill up any of the vacancies made by the deprived bishops. Upon the death of Dr Lamplogh, he was promoted to the see of York. In 1702 he preached the sermon at the coronation of Queen Anne; and the same year was sworn of the privy council, and made lord almoner to her majesty. He died at Bath in 1713; and was interred in the cathedral of York, where a monument is erected to his memory.—His sermons, which were collected after his death and published in 7 vols. 8vo, are justly admired.

SHARP, in music. See INTERVAL.

SHASTER, or BENANG, the name of a sacred book, in high estimation among the idolaters of Hindostan, containing all the dogmas of the religion of the bramins, and all the ceremonies of their worship; and serving as a commentary on the VEDAM.

The term *Shaster* denotes "science" or "system;" and is applied to other works of astronomy and philosophy, which have no relation to the religion of the Indians. None but the bramins and rajahs of India are allowed to read the Vedam; the priests of the Banians, called *shuderers*, may read the Shaster; and the people, in general, are allowed to read only the Paran or Pouran, which is a commentary on the Shaster.

The Shaster is divided into three parts: the first containing the moral law of the Indians; the second, the rites and ceremonies of their religion; and the third, the distribution of the people into tribes or classes, with the duties pertaining to each class.

The principal precepts of morality contained in the first part of the Shaster are the following: that no animal be killed, because the Indians attribute souls to brute animals as well as to mankind; that they neither hear nor speak evil, nor drink wine, nor eat flesh, nor touch any thing that is unclean; that they observe the feasts, prayers, and washings, which their law prescribes; that they tell no lies, nor be guilty of deceit in trade; that they neither oppress nor offer violence to one another; that they celebrate the solemn feasts and fasts, and appropriate certain hours of ordinary sleep to cultivate a disposition for prayer; and that they do not steal or defraud one another.

The ceremonies contained in the second part of the Shaster are such as these: that they wash often in the rivers, hereby obtaining the pardon of their sins; that they mark their forehead with red, in token of their relation to the Deity; that they present offerings and prayers under certain trees, set apart for this purpose; that they pray in the temples, make oblations to their pagodas, or idols, sing hymns, and make processions, &c.; that they make pilgrimages to distant rivers, and especially to the Ganges, there to wash themselves and make offerings; that they make vows to particular saints, according to their respective departments; that they render homage to the Deity at the first sight of the sun; that they pay their respect to the sun and moon, which are the two eyes of the Deity; and that they treat with particular veneration those animals that are deemed more pure than others; as the cow, buffalo, &c.; because the souls of men have transmigrated into these animals.

The third part of the Shaster records the distribution of the people into four classes; the first being that of the bramins or priests, appointed to instruct the people; the second, that of the kutteris or nobles, who are the magistrates; the third, that of the shodderis or merchants; and the fourth, that of the mechanics. Each person is required to remain in the class in which he was born, and to pursue the occupation assigned to him by the Shaster. According to the bramins, the Shaster was imparted by God himself to Brahma, and by him to the bramins; who communicated the contents of it to the people.

Modern writers have given us very different accounts of the antiquity and importance of the Shaster. Mr Holwell, who had made considerable progress in the translation of this book, apprehends, that the mythology as well as the cosmogony of the Egyptians, Greeks, and Romans, were borrowed from the doctrines of the bramins, contained in it, even to the copying of their exteriors of worship, and the distribution of their idols, though grossly mutilated and adulterated. With respect to the Vedam and Shaster, or scriptures of the Gentoos, this writer informs us, that *Vedam*, in the Malabar language, signifies the same as *Shaster* in the Shanscrit; and that the first book is followed by the Gentoos of the Malabar and Coromandel coasts, and also of the island of Ceylon. The Shaster is followed by the Gentous of the provinces of Bengal, and by all the Gentoos of the rest of India, commonly called *India Proper*, along the course of the rivers Ganges and Jumna to the Indus. Both these books (he says) contain the institutes of their respective religion and worship, as well as the history of their ancient rajahs and princes, often couched under allegory and fable. Their antiquity is contended for by the partizans of each; but he thinks, that the similitude of their names, idols, and great part of their worship, leaves little room to doubt, nay plainly evinces, that both these scriptures were originally one. He adds, if we compare the great purity and chaste manners of the Shaster with the great absurdities and impurities of the Vedam, we need not hesitate to pronounce the latter a corruption of the former.

With regard to the high original of these scriptures, the account of the bramins is as follows: Brahma (that is, "Mighty Spirit"), about 4866 years ago, assumed the form of man and the government of Indostan. He translated the divine law (designed for the restoration of mankind, who had offended in a pre-existent state, and who are now in their last scene of probation, to the dignity from which they were degraded) out of the language of angels into the well known Shanscrit language, and called his translation the *Chartah Bhade Shastah of Birmah*, or *the Six Scriptures of Divine Words of the Mighty Spirit*. He appointed the bramins, deriving their name from him, to preach the word of God; and the doctrines of the Shaster were accordingly preached in their original purity 1000 years. About this time there was published a paraphrase on the Chartah Bhade; and about 500 years afterwards, a second exposition, called the *Aughtorrah Bhade Shasta*, or *Eighteen Books of Divine Words*, written in a character compounded of the common Indostan and the Shanscrit. This innovation produced a schism among the Gentoos; on which occasion, it is said, those of Coromandel and Malabar formed a scripture of their own, which they pretended to be founded on the Chartah Bhade

Shaster.

Bhade of Brahma, and called it *the Vedam of Birmah*, or *Divine Words of the Mighty Spirit*. The original Chartah Bhade was thrown aside, and at length wholly unknown, except to a few families; who can still read and expound it in the Shanscrit character. With the establishment of the Aughtorrah Bhade, and Vedam, which according to the Gentoo account, is 3366 years ago, their polytheism commenced; and the principles of religion became so obscure, and their ceremonies so numerous, that every head of a family was obliged to keep a bramin as a guide both in faith and practice. Mr Holwell is of opinion, that the Chartah Bhade, or Original Scriptures, are not copied from any other system of theology, promulgated to or obtruded upon mankind. The Gentoos do not attribute them to Zoroaster; and Mr Holwell supposes, that both Zoroaster and Pythagoras visited Industan, not to instruct, but to be instructed.

From the account of Mr Dow, we learn, that the books which contain the religion and philosophy of the Hindoos are distinguished by the name of *Bedas*; that they are four in number, and, like the sacred writings of other nations, said to be penned by the Divinity. Beda, he says, in the Shanscrit language, literally signifies *science*; and these books treat not only of religion and moral duties, but of every branch of philosophic knowledge. The bramins maintain, that the Bedas are the divine laws, which Brimha, at the creation of the world, delivered for the instruction of mankind; but they affirm, that their meaning was perverted in the first age by the ignorance and wickedness of some princes, whom they represent as evil spirits, who then haunted the earth.

The first credible account we have of the Bedas is, that about the commencement of the Cal Jug, of which era the year 1768 was the 4886th year, they were written, or rather collected, by a great philosopher and reputed prophet, called *Beäss Muni*, or *Beäss the Inspired*.

The Hindoos, says Mr Dow, are divided into two great religious sects: the followers of the doctrine of Bedang, which is the original Shaster, or commentary upon the Bedas; and those who adhere to the principles of the Neadirsen. The original Shaster is called *Bedang*, and is a commentary upon the Bedas. This book, he says, is erroneously called in Europe, the *Vedam*. It is ascribed to Beäss Muni, and is said to have been revised some years after by one Serrider Swami, since which it has been reckoned sacred, and not subject to any farther alterations.

Almost all the Hindoos of the Decan, and those of the Malabar and Coromandel coasts, are of this sect. The followers of the Bedang Shaster do not allow that any physical evil exists; they maintain that God created all things perfectly good; but that man, being a free agent, may be guilty of moral evil, which may be injurious to himself, but can be of no detriment to the general system of nature. God, they say, being perfectly benevolent, never punished the wicked otherwise than by the pain and affliction which are the natural consequences of evil actions; and hell, therefore, is no other than a consciousness of evil.

The Neadirsen Shaster is said to have been written by a philosopher called *Goutam*, near four thousand years ago. The bramins, from Mr Dow's account of their sacred books, appear to believe invariably in the unity, eternity, omniscience, and omnipotence of God; and the polytheism of which they have been accused is no more than a symbolical worship of the divine attributes, which they divide into three classes. Under the name of *Brimha*, they worship the wisdom and creative power of God; under the appellation of *Bishen*, his providential and preserving quality; and under that of *Shibah*, that attribute which tends to destroy.

As few of our readers may have an opportunity of perusing the Shaster, we shall, by way of specimen subjoin a passage from it, which, though it contains some metaphysical mysteries concerning the creation, yet discovers views of God so enlightened that they would not disgrace more refined nations. The passage which we shall quote is the first chapter of the Shaster, which is a dialogue between Brimha the Wisdom of the Divinity, and Narud or Reason, who is represented as the son of Brimha. Narud desires to be instructed by his father; and for that purpose puts the following questions to him:

"*Narud*. O father! thou first of God, thou art said to have created the world, and thy son Narud, astonished at what he beholds, is desirous to be instructed how all these things were made.

"*Brimha*. Be not deceived, my son! do not imagine that I was the creator of the world, independent of the Divine Mover, who is the great original essence and creator of all things. Look, therefore, only upon me as the instrument of the great *will*, and a part of his being, whom he called forth to execute his eternal designs.

"*Narud*. What shall we think of God?

"*Brimha*. Being immaterial, he is above all conception; being invisible, he can have no form; but, from what we behold in his works, we may conclude that he is eternal, omnipotent, knowing all things, and present everywhere.

"*Narud*. How did God create the world?

"*Brimha*. Affection dwelt with God from all eternity. It was of three different kinds; the creative, the preserving, and the destructive. This first is represented by Brimha, the second by Bishen, and the third by Shibah. You, O Narud! are taught to worship all the three in various shapes and likenesses, as the Creator, the Preserver, and the Destroyer. The affection of God then produced power, and power, at a proper conjunction of time and fate, embraced goodness and produced matter. The three qualities then acting upon matter, produced the universe in the following manner: From the opposite actions of the creative and destructive quality in matter, self-motion first arose. Self-motion was of three kinds; the first inclining to plasticity, the second to discord, and the third to rest. The discordant actions then produced the Akash (a kind of celestial element), which invisible element possessed the quality of conveying sound; it produced air, a palpable element; fire, a visible element; water, a fluid element; and earth, a solid element.

"The Akash dispersed itself abroad. Air formed the atmosphere; fire, collecting itself, blazed forth in the host of heaven; water rose to the surface of the earth, being forced from beneath by the gravity of the latter element. Thus broke forth the world from the veil of darkness, in which it was formerly comprehended

ed by God. Order rose over the universe. The seven heavens were formed, and the seven worlds were fixed in their places; there to remain till the great dissolution, when all things shall be absorbed into God.

"God seeing the earth in full bloom, and that vegetation was strong from its seeds, called forth for the first time intellect, which he endued with various organs and shapes, to form a diversity of animals upon the earth. He endued the animals with five senses; feeling, seeing, smelling, tasting, and hearing; but to man he gave reflection, to raise him above the beasts of the field.

"The creatures were created male and female, that they might propagate their species upon the earth. Every herb bore the seed of its kind, that the world might be clothed with verdure, and all animals provided with food.

"*Narud.* What dost thou mean, O father! by Intellect?

"*Brimha.* It is a portion of the *great soul* of the universe breathed into all creatures, to animate them for a certain time.

"*Narud.* What becomes of it after death?

"*Brimha.* It animates other bodies, or returns, like a drop, into that unbounded ocean from which it first arose.

"*Narud.* Shall not then the souls of good men receive rewards? nor the souls of the bad meet with punishment?

"*Brimha.* The souls of men are distinguished from those of other animals; for the first are endued with reason, and with a consciousness of right and wrong. If therefore man shall adhere to the first, as far as his powers shall extend, his soul, when disengaged from the body by death, shall be absorbed into the divine essence, and shall never more reanimate flesh: But the souls of those who do evil are not, at death, disengaged from all the elements. They are immediately clothed with a body of fire, air, and akash, in which they are for a time punished in hell. After the season of their grief is over, they reanimate other bodies; but till they shall arrive at a state of purity they can never be absorbed into God.

"*Narud.* What is the nature of that absorbed state which the souls of good men enjoy after death?

"*Brimha.* It is a participation of the divine nature, where all passions are utterly unknown, and where consciousness is lost in bliss.

Narud. Thou sayest, O father, that unless the soul is perfectly pure it cannot be absorbed into God: now, as the actions of the generality of men are partly good and partly bad, whither are their spirits sent immediately after death?

"*Brimha.* They must atone for their crimes in hell, where they must remain for a space proportioned to the degree of their iniquities; then they rise to heaven to be rewarded for a time for their virtues; and from thence they will return to the world to reanimate other bodies.

"*Narud.* What is time?

"*Brimha.* Time existed from all eternity with God: but it can only be estimated since motion was produced, and only be conceived by the mind, from its own constant progress.

"*Narud.* How long shall this world remain?

"*Brimha.* Until the four Jugs shall have revolved. Then Rudden (the same with *Shibah*, the destroying quality of God), with the ten spirits of dissolution, shall roll a comet under the moon, that shall involve all things in fire, and reduce the world into ashes. God shall then exist alone, for matter will be totally annihilated."

Those who desire more information on this subject may consult *Dow's History of Indostan*, and *Holwell's Interesting Historical Events*.

SHAW (Dr Thomas), known to the learned world by his travels to Barbary and the Levant, was born at Kendal in Westmorland about the year 1692. He was appointed chaplain to the English consul at Algiers, in which station he continued for several years; and from thence took proper opportunities of travelling into different parts. He returned in 1733; was elected fellow of the Royal Society; and published the account of his travels at Oxford, folio, 1738. In 1740 he was nominated principal of St Edmond-hall, which he raised from a ruinous state by his munificence; and was regius professor of Greek at Oxford until his death, which happened in 1751. Dr Clayton, Bp. of Clogher, having attacked these Travels in his Description of the East, Dr Shaw published a supplement by way of vindication, which is incorporated into the second edition of his Travels, prepared by himself, and published in 4to, 1757.

SHAWLS, are woollen handkerchiefs, an ell wide, and near two long. The wool is so fine and silky, that the whole handkerchief may be contained in the two hands closed. It is the produce of a Tibet sheep; but some say that no wool is employed but that of lambs torn from the belly of their mother before the time of birth. The most beautiful shawls come from Cashmire: their price is from 150 livres (about six guineas) to 1200 livres (or 50l. sterling.)

In the Transactions of the Society for Encouraging Arts, Manufactures, &c. for the year 1792, we are informed that a shawl counterpane, four yards square, manufactured by Mr P. J. Knights of Norwich, was presented to the Society; and that, upon examination, it appeared to be of greater breadth than any goods of equal fineness and texture that had ever before been presented to the Society, or to their knowledge woven in this country. The shawls of Mr Knights' manufacture, it is said, can scarcely be distinguished from Indian shawls, though they can be afforded at one twentieth part of the price. When the shawl is 16 quarters square, Mr Knights says it may be retailed at 20l.; if it consisted of 12 quarters, and embroidered as the former, it will cost 15l. if plain, with a fringe only, a shawl of 16 quarters square may be sold at 8l. 8s.; if 12 quarters and fringed, at 6l. 6s.

Mr Knights maintains, that his counterpane of four yards square is equal in beauty, and superior in strength, to the Indian counterpanes which are sold at 200 guineas. The principal consumption of this cloth is in train-dresses for ladies; as likewise for long scarfs, in imitation of the real Indian scarfs, which are sold from 60l. to 80l. whereas scarfs of this fabric are sold for as many shillings, and the ladies square shawls in proportion.

SHEADING, a riding, tything, or division, in the Isle of Man; the whole island being divided into six sheadings; in every one of which is a coroner or chief constable,

Shearbill, Sheep.

conſtable, appointed by the delivery of a rod at the annual convention.

SHEARBILL, the *Rhynchops Nigra* of Linnæus, the *Black Skimmer* of Pennant and Latham, and *Cut-water* of Cateſby. Its bill is much compreſſed; the edges are ſharp; the lower mandible is four inches and a half long; the upper only three; the baſe red; the reſt is black: the forehead, chin, front of the neck, the breaſt, and belly, are white: the head and whole upper part of the body are black: the wings are of the ſame colour: the lower part of the inner webs of the primaries is white: the tail is ſhort, and a little forked; the middle feathers are duſky; the others are white on their ſides; the legs are weak and red: the length is one foot eight inches: the extent is three feet ſeven inches. It inhabits America from New York to Guiana. It ſkims nimbly along the water, with its under mandible juſt beneath the ſurface, feeding on the inſects and ſmall fiſh as it proceeds. It frequents alſo oyſter-banks; its bill being partly like that of the oyſter-catcher, adapted for preying on thoſe ſhell-fiſh.

SHEATHING, in the ſea-language, is the caſing that part of a ſhip which is to be under water with fir-board of an inch thick; firſt laying hair and tar mixed together upon the boards, and then nailing them on, in order to prevent worms from eating the ſhip's bottom.—Ships of war are now generally ſheathed with copper: but copper ſheathing is liable to be corroded by the action of ſalt water, and ſomething is ſtill wanting to effect this purpoſe. It is very probable that tar might anſwer very well.

In the Corniſh mines, copper or braſs pumps are often placed in the deepeſt parts, and are conſequently expoſed to the vitriolic or other mineral waters with which ſome of theſe mines abound, and which are known to have a much ſtronger effect on copper than ſea-water. Theſe pumps are generally about ſix feet long, and are ſcrewed together, and made tight by the interpoſition of a ring of lead, and the joinings are afterwards tarred. One of theſe pumps was ſo much corroded as to render it unfit for uſe; but the ſpots of tar, which by accident had dropped on it, preſerved the parts they covered from the action of the water. Theſe projected in ſome places more than a quarter of an inch; and the joints were ſo far defended by the thin coat of tar, that it was as perfect as when it came from the hands of the manufacturer. If tar thus effectually defends copper from theſe acrimonious waters, can there remain a doubt of its preſerving it from the much milder waters of the ſea?

SHEATS, in a ſhip, are ropes bent to the clews of the ſails; ſerving in the lower ſails to haul aft the clews of the ſail; but in topſails they ſerve to haul home the clew of the ſail cloſe to the yard-arm.

SHEEP, in zoology. See Ovis and Wool.

Among the various animals with which Divine Providence has ſtored the world for the uſe of man, none is to be found more innocent, more uſeful, or more valuable, than the ſheep. The ſheep ſupplies us with food and clothing, and finds ample employment for our poor at all times and ſeaſons of the year, whereby a variety of manufactures of woollen cloth is carried on without interruption to domeſtic comfort and loſs to friendly ſociety or injury to health, as is the caſe with many other occupations. Every lock of wool that grows on its back becomes the means of ſupport to ſtaplers, dyers, pickers, ſcourers, ſcriblers, carders, combers, ſpinners, ſpoolers, warpers, queelers, weavers, fullers, tuckers, burlers, ſhearmen, preſſers, clothiers, and packers, who, one after another, tumble and toſs, and twiſt, and bake, and boil, this raw material, till they have each extracted a livelihood out of it; and then comes the merchant, who, in his turn, ſhips it (in its higheſt ſtate of improvement) to all quarters of the globe, from whence he brings back every kind of riches to his country, in return for this valuable commodity which the ſheep affords.

Sheep. 1 Sheep ſerve a wonderful variety of purpoſes.

Beſides this, the uſeful animal, after being deprived of his coat, produces another againſt the next year; and when we are hungry, and kill him for food, he gives us his ſkin to employ the fell-mongers and parchment-makers, who ſupply us with a durable material for ſecuring our eſtates, rights, and poſſeſſions; and if our enemies take the field againſt us, ſupplies us with a powerful inſtrument for rouſing our courage to repel their attacks. When the parchment-maker has taken as much of the ſkin as he can uſe, the glue-maker comes after and picks up every morſel that is left, and therewith ſupplies a material for the carpenter and cabinet-maker, which they cannot do without, and which is eſſentially neceſſary before we can have elegant furniture in our houſes; tables, chairs, looking-glaſſes, and a hundred other articles of convenience: and when the winter nights come on, while we are deprived of the cheering light of the ſun, the ſheep ſupplies us with an artificial mode of light, whereby we preſerve every pleaſure of domeſtic ſociety, and with whoſe aſſiſtance we can continue our work, or write or read, and improve our minds, or enjoy the ſocial mirth of our tables. Another part of the ſlaughtered animal ſupplies us with an ingredient neceſſary for making good common ſoap, a uſeful ſtore for producing cleanlineſs in every family, rich or poor. Neither need the horns be thrown away; for they are converted by the button-makers and turners into a cheap kind of buttons, tips for bows, and many uſeful ornaments. From the very trotters an oil is extracted uſeful for many purpoſes, and they afford good food when baked in an oven.

Even the bones are uſeful alſo; for by a late invention of Dr Higgins, they are found, when reduced to aſhes to be an uſeful and eſſential ingredient in the compoſition of the fineſt artificial ſtone in ornamental work for chimney-pieces, cornices of rooms, houſes, &c. which renders the compoſition more durable by effectually preventing its cracking (A).

If it is objected to the meek inoffenſive creature, that he

(A) Any curious perſon would be much entertained to ſee the manufactory of bone-aſh, now carried on by Mr Smith of Whitechapel, New Road, wherein the bones of ſheep and cows undergo many ingenious proceſſes. 1. There is a mill to break them; 2. A caldron to extract their oil, marrow, and fat; 3. A reverberatory to heat them red hot; 4. An oven for thoſe bones to moulder to aſhes; 5. A ſtill to collect the fumes of the burnt bones

he is expenſive while living, in eating up our graſs, &c. it may be anſwered that it is quite the contrary; for he can feed where every other animal has been before him and grazed all they could find; and that if he takes a little graſs on our downs or in our fields, he amply repays us for every blade of graſs in the richneſs of the manure which he leaves behind him. He protects the hands from the cold wintry blaſt, by providing them with the ſofteſt leather gloves. Every gentleman's library is alſo indebted to him for the neat binding of his books, for the ſheath of his ſword, and for caſes for his inſtruments; in ſhort, not to be tedious in mentioning the various uſes of leather, there is hardly any furniture or utenſil of life but the ſheep contributes to render either more uſeful, convenient, or ornamental.

As the ſheep is ſo valuable an animal, every piece of information concerning the proper method of managing it muſt be of importance. It will not therefore be uſeleſs nor unentertaining to give ſome account of the manner of managing ſheep in Spain, a country famous for producing the beſt wool in the world.

2 Account of the Spaniſh ſheep

In Spain there are two kinds of ſheep: the coarſe-woolled ſheep, which always remain in their native country, and are houſed every night in winter; and the fine-woolled ſheep, which are always in the open air, and travel in the ſummer from the cool mountains of the northern parts of Spain, to feed in winter on the ſouthern warm plains of Andaluſia, Mancha, and Eſtremadura. Of theſe latter, it appears from accurate computations, that there are about five millions (a); and that the wool and fleſh of a flock of 10,000 ſheep produce yearly about 24 reals a-head, or about the value of 12 Engliſh ſixpences, one of which belongs to the owner, three to the king, and the other eight are allowed for the expences of paſture, tythes, ſhepherds, dogs, ſalt, ſhearing, &c. Ten thouſand ſheep form a flock, which is divided into ten tribes, under the management of one perſon, who has abſolute dominion over fifty ſhepherds and fifty dogs.

3 of Segovia,

Bourgoanne's Travels, Vol. I. p. 53.

M. Bourgoanne, a French gentleman, who reſided many years in Spain, and directed his inquiries chiefly to the civil government, trade, and manufactures, of that country, gives the following account of the wandering ſheep of Segovia. "It is (ſays he) in the neighbouring mountains that a part of the wandering ſheep feed during the fine ſeaſon. They leave them in the month of October, paſs over thoſe which ſeparate the two Caſtiles, croſs New Caſtile, and diſperſe themſelves in the plains of Eſtremadura and Andaluſia. For ſome years paſt thoſe of the two Caſtiles, which are within reach of the Sierra-Murena, go thither to paſs the winter; which, in that part of Spain, is more mild; the length of their day's journey is in proportion to the paſture they meet with. They travel in flocks from 1000 to 1200 in number, under the conduct of two ſhepherds; one of whom is called the *Mayoral*, the other the *Zagal*. When arrived at the place of their deſtination, they are diſtributed in the paſtures previouſly aſſigned them. They return in the month of April; and whether it be habit or natural inſtinct that draws them towards the climate, which at this ſeaſon becomes moſt proper for them, the inquietude which they manifeſt might, in caſe of need, ſerve as an almanack to their conductors."

Mr Arthur Young, in that patriotic work which he conducted with great induſtry and judgment, the Annals of Agriculture, gives us a very accurate and intereſting account of the Pyrenean or Catalonian ſheep.

4 of Catalonia.

Annals of Agriculture Vol VIII. p. 195.

"On the northern ridge, bearing to the weſt, are the paſtures of the Spaniſh flocks. This ridge is not, however, the whole; there are two other mountains, quite in a different ſituation, and the ſheep travel from one to another as the paſturage is ſhort or plentiful. I examined the ſoil of theſe mountain paſtures, and found it in general ſtony; what in the weſt of England would be called a *ſtone braſh*, with ſome mixture of loam, and in a few places a little peaty. The plants are many of them untouched by the ſheep; many ferns, narciſſus, violets, &c. but burnet (*poterium ſanguiſorba*) and the narrow-leaved plantain (*plantago lanceolata*) were eaten, as may be ſuppoſed, cloſe. I looked for trefoils, but found ſcarcely any; it was very apparent that ſoil and peculiarity of herbage had little to do in rendering theſe heights proper for ſheep. In the northern parts of Europe, the tops of mountains half the height of theſe (for we were above ſnow in July) are bogs; all are ſo which I have ſeen in our iſlands, or at leaſt the proportion of dry land is very trifling to that which is extremely wet: Here they are in general very dry. Now a great range of dry land, let the plants be what they may, will in every country ſuit ſheep. The flock is brought every night to one ſpot, which is ſituated at the end of the valley on the river I have mentioned, and near the port or paſſage of Picada: it is a level ſpot ſheltered from all winds. The ſoil is 8 or 9 inches deep of old dung, not at all encloſed: from the freedom from wood all around, it ſeems to be choſen partly for ſafety againſt wolves and bears. Near it is a very large ſtone, or rather rock fallen from the mountain. This the ſhepherds have taken for a ſhelter, and have built a hut againſt it; their beds are ſheep ſkins, and their door ſo ſmall that they crawl in. I ſaw no place for fire; but they have it, ſince they dreſs here the fleſh of their ſheep, and

---

bones into a brown fluid, from whence hartſhorn is made; 6. Furnaces for making parts thereof into Glauber's ſalts; 7. A ſand heat containing twelve jars, for collecting a cryſtallizing vapour into ſal-ammoniac.

(a) In the 16th century the travelling ſheep were eſtimated at ſeven millions: under Philip III. the number was diminiſhed to two millions and a half. Uſtariz, who wrote at the beginning of this century, made it amount to four millions. The general opinion is, that at preſent it does not exceed five millions. If to this number the eight millions of ſtationary ſheep be added, it will make nearly thirteen millions of animals, all managed contrary to the true intereſts of Spain, for the advantage of a few individuals. For the proprietors of ſtationary flocks alſo have privileges which greatly reſemble thoſe of the members of the Meſta. According to Arriquebar, Spain contains eight millions of fine-woolled ſheep, ten millions of coarſe-woolled, and five hundred thouſand bulls, oxen, and cows.

Sheep.

and in the night sometimes keep off the bears, by whirling fire-brands: four of them belonging to the flock mentioned above lie here. I viewed their flock very carefully, and by means of our guide and interpreter, made some inquiries of the shepherds, which they answered readily, and very civilly. A Spaniard at Venasque, a city in the Pyrenees, gives 600 livres French (the livre is 10½d. English) a-year for the pasturage of this flock of 2000 sheep. In the winter he sends them into the lower parts of Catalonia, a journey of 12 or 13 days, and when the snow is melted in the spring, they are conducted back again. They are the whole year kept in motion, and moving from spot to spot, which is owing to the great range they everywhere have of pasture. They are always in the open air, never housed or under cover, and never taste of any food but what they can find on the hills.

"Four shepherds, and from four to six large Spanish dogs, have the care of this flock: the latter are in France called of the *Pyrenees breed*; they are black and white, of the size of a large wolf, a large head and neck, armed with collars stuck with iron spikes. No wolf can stand against them; but bears are more potent adversaries: if a bear can reach a tree, he is safe; he rises on his hind legs, with his back to the tree, and sets the dogs at defiance. In the night the shepherds rely entirely on their dogs; but on hearing them bark are ready with fire arms, as the dogs rarely bark if a bear is not at hand. I was surprised to find that they are fed only with bread and milk. The head shepherd is paid 120 livres a-year wages and bread; the others 80 livres and bread. But they are allowed to keep goats, of which they have many which they milk every day. Their food is milk and bread, except the flesh of such sheep or lambs as accidents give them. The head shepherd keeps on the mountain top, or an elevated spot, from whence he can the better see around while the flock traverses the declivities. In doing this the sheep are exposed to great danger in places that are stony; for by walking among the rocks, and especially the goats, they move the stones, which, rolling down the hills, acquire an accelerated force enough to knock a man down, and sheep are often killed by them; yet we saw how alert they were to avoid such stones, and cautiously on their guard against them. I examined the sheep attentively. They are in general polled, but some have horns; which in the rams turn backwards behind the ears and project half a circle forward; the ewes horns turn also behind the ears, but do not project: the legs white or reddish; speckled faces, some white, some reddish; they would weigh fat, I reckon, on an average, from 15 lb. to 18 lb. a quarter. Some tails short, some left long. A few black sheep among them: some with a very little tuft of wool on their foreheads. On the whole they resemble those on the South Downs; their legs are as short as those of that breed; a point which merits observation, as they travel so much and so well. Their shape is very good; round ribs and flat straight backs; and would with us be reckoned handsome sheep; all in good order and flesh. In order to be still better acquainted with them, I desired one of the shepherds to catch a ram for me to feel, and examine the wool, which I found very thick and good of the carding sort, as may be supposed. I took a specimen of it, and also of a hoggit, or lamb of last year. In regard to the mellow softness under the skin, which, in Mr Bakewell's opinion, is a strong indication of a good breed, with a disposition to fatten, he had it in a much superior degree to many of our English breeds, to the full as much so as the South Downs, which are for that point the best short-woulled sheep which I know in England. The fleece was on his back, and weighed, as I guessed, about 8 lb. English; but the average, they say, of the flock is from four to five, as I calculated by reducing the Catalonian pound of 12 oz. to ours of 16, and is all sold to the French at 30s. the lb. French. This ram had the wool of the back part of his neck tied close, and the upper tuft tied a second knot by way of ornament; nor do they ever shear this part of the fleece for that reason: we saw several in the flock with this species of decoration. They said that this ram would sell in Catalonia for 20 livres. A circumstance which cannot be too much commended, and deserves universal imitation, is the extreme docility they accustom them to. When I desired the shepherd to catch one of his rams, I supposed he would do it with his crook, or probably not be able to do it at all; but he walked into the flock, and singling out a ram and a goat, bid them follow him, which they did immediately; and he talked to them while they were obeying him, holding out his hand as if to give them something. By this method he brought me the ram, which I caught, and held without difficulty."

5 What sheep produce the best wool.

The best sort of sheep for fine wool are those bred in Herefordshire, Devonshire, and Worcestershire; but they are small, and black-faced, and bear but a small quantity. Warwick, Leicestershire, Buckingham, and Northamptonshire, breed a large-boned sheep, of the best shape and deepest wool we have. The marshes of Lincolnshire breed a very large kind of sheep, but their wool is not good, unless the breed be mended by bringing in sheep of other counties among them, which is a scheme of late very profitably followed there. In this county, it is no uncommon thing to give fifty guineas for a ram, and a guinea for the admission of a ewe to one of these valuable males, or twenty guineas fur the use of it for a certain number of ewes during one season. Suffolk also breeds a very valuable kind of sheep. The northern counties in general breed sheep with long but hairy wool; however, the wool which is taken from the neck and shoulders of the Yorkshire sheep is used for mixing with Spanish wool in some of their finest cloths.

Wales bears a small hardy kind of sheep, which has the best tasted flesh, but the worst wool of all. Nevertheless it is of more extensive use than the finest Segovian fleeces; for the benefit of the flannel manufacture is universally known. The sheep of Ireland vary like those of Great Britain: those of the south and east being large and their flesh rank: those of the north and the mountainous parts small and their flesh sweet. The fleeces in the same manner differ in degrees of value. Scotland breeds a small kind, and their fleeces are coarse.

But the new Leicestershire breed is the most fashionable, and of course the most profitable breed in the island. Joseph Altom of Clifton, who raised himself from a plough-boy, was the first who distinguished himself

Sheep. self in the midland counties of England for a superior breed of sheep. How he improved his breed is not known; but it was customary for eminent farmers in his time to go to Clistoo in summer to choose and purchase ram-lambs, for which they paid two or three guineas. This man was succeeded by Mr Bakewell; and it may reasonably be supposed that the breed, by means of Altom's stock, had passed the first stage of improvement before Mr Bakewell's time. Still, however, it must be acknowledged, that the Leicestershire breed of sheep owes its present high state of improvement to the ability and care of Mr Bakewell.

6 Account of Mr Bakewell's breed. *Marshall's Midland Counties*, Vol. I. p. 382.

"The manner in which Mr Bakewell raised his sheep to the degree of celebrity in which they deservedly stand, is, notwithstanding the recentness of the improvement, and its being done in the day of thousands now living, a thing in dispute; even among men high in the profession, and living in the very district in which the improvement has been carried on!

7 How it is supposed he improved it.

"Some are of opinion that he effected it by a cross with the Wiltshire breed; an improbable idea, as their form altogether contradicts it: others, that the Ryeland breed were used for this purpose; and with some show of probability. If any cross whatever was used, the Ryeland breed, whether we view the form, the size, the wool, the flesh, or the fatting quality, is the most probable instrument of improvement.

"These ideas, however, are registered merely as matters of opinion. It is more than probable that Mr Bakewell alone is in possession of the several minutiæ of improvement; and the public can only hope that at a proper time the facts may be communicated for the direction of future improvers.

"Whenever this shall take place, it will most probably come out that no cross with any alien breed whatever has been used; but that the improvement has been effected by selecting individuals from kindred breeds; from the several breeds or varieties of long-woolled sheep, with which Mr Bakewell was surrounded on almost every side, and by breeding, *inandin* (c), with this selection: solicitously seizing the superior accidental varieties produced; associating these varieties; and still continuing to select, with judgment, the superior individuals.

8 Description of his ewes and wedders.

"It now remains to give a description of the superior class of individuals of this breed, especially ewes and wedders, in full condition, but not immoderately fat. The rams will require to be distinguished afterwards.

"The head is long, small, and hornless, with ears somewhat long, and standing backward, and with the nose shooting forward. The neck thin, and clean toward the head; but taking a conical form; standing low, and enlarging every way at the base; the fore-end altogether short. The bosom broad, with the shoulders, ribs, and chine extraordinary full. The loin broad, and the back level. The haunches comparatively full towards the hips, but light downwards; being altogether small in proportion to the fore parts. The legs, at present, of a moderate length; with the bone extremely fine. The bone throughout remarkably light. The carcass, when fully fat, takes a remarkable form; much wider than it is deep, and almost as broad as it is long. Full on the shoulder, widest on the ribs, narrowing with a regular curve towards the tail; approaching the form of the turtle nearer perhaps than any other animal. The pelt is thin, and the tail small. The wool is shorter than long wools in general, but much longer than the middle wools; the ordinary length of staple five to seven inches, varying much in fineness and weight."

9 Fatten remarkably well.

This breed surpasses every other in beauty of form; they are full and weighty in the fore quarters; and are remarkable for smallness of bone. Mr Marshall, who has been of so much benefit to agriculture and his country by his publications, informs us, in his Rural Economy of the Midland Counties, that he has seen a rib of a sheep of this breed contrasted with one of a Norfolk sheep: the disparity was striking; the latter nearly twice the size; while the meat which covered the former was three times the thickness: consequently the proportion of meat to bone was in the one incomparably greater than in the other. Therefore, in this point of view, the improved breed has a decided preference: for surely while mankind continue to eat flesh and throw away bone, the former must be, to the consumer at least, the more valuable.

The criterions of good and bad flesh while the animal is alive differ in different species, and are not properly settled in the same species. One superior breeder is of opinion, that if the flesh is not loose, it is of course good; holding, that the flesh of sheep is never found in a state of hardness, like that of ill-fleshed cattle: while others make a fourfold distinction of the flesh of sheep; as looseness, mellowness, firmness, hardness: considering the first and the last equally exceptionable, and the second and third equally desirable; a happy mixture of the two being deemed the point of perfection.

The flesh of sheep, when slaughtered, is well known to be of various qualities. Some is composed of large coarse grains, interspersed with wide empty pores like a sponge: others, of large grains, with wide pores filled with fat; others, of fine close grains, with smaller pores filled with fat: and a fourth, of close grains, without any intermixture of fatness.

The flesh of sheep, when dressed, is equally well known to possess a variety of qualities: some mutton is coarse, dry, and insipid; a dry sponge, affording little or no gravy of any colour. Another sort is somewhat firmer, imparting a light-coloured gravy only. A third plump, short, and palatable; affording a mixture of white and red gravy. A fourth likewise plump and well-flavoured, but discharging red gravy, and this in various quantities.

It is likewise observable, that some mutton, when dressed, appears covered with a thick, tough, parchment-like integument; others with a membrane comparatively fine and flexible. But these, and some of the other qualities of mutton, may not be wholly owing to breed, but in part to the age and the state of fatness at the time of slaughter. Examined in this light, whether

(c) *Inandin* is a term used in the midland counties of England to express breeding from the same family.

Sheep.

ther we consider the degree of fatness, or their natural propensity to a state of fatness, even at an early age, the improved breed of Leicestershire sheep appear with many superior advantages.

The degree of fatness to which the individuals of this breed are capable of being raised, will perhaps appear incredible to those who have not had an opportunity of being convinced by their own observation. "I have seen wedders (says Mr Marshall) of only two shear (two to three years old) so loaded with fat as to be scarcely able to make a run; and whose fat lay so much without the bone, it seemed ready to be shaken from the ribs on the smallest agitation.

dland ...ties, ...l. I. ...398.

"It is common for the sheep of this breed to have such a projection of fat upon the ribs, immediately behind the shoulder, that it may be easily gathered up in the hand, as the flank of a fat bullock. Hence it has gained, in technical language, the name of the *fore flank*; a point which a modern breeder never fails to touch in judging of the quality of this breed of sheep.

"What is, perhaps, still more extraordinary, it is not rare for the rams, at least of this breed, to be 'cracked on the back;' that is, to be cloven along the top of the chine, in the manner fat sheep generally are upon the rump. This mark is considered as an evidence of the best blood.

"Extraordinary, however, as are these appearances while the animals are living, the facts are still more striking after they are slaughtered. At Litchfield, in February 1785, I saw a fore quarter of mutton, fatted by Mr Princep of Croxall, and which measured upon the ribs four inches of fat. It must be acknowledged, however, that the Leicestershire breed do not produce so much wool as most other long wooled sheep."

As the practice of letting rams by the season is now become profitable, it may be useful to mention the method of rearing them.

10
...w the ...s are ...red.

"The principal ram breeders save annually twenty, thirty, or perhaps forty ram lambs; castration being seldom applied, in the first instance, to the produce of a valuable ram: for in the choice of these lambs they are led more by blood, or parentage, than by form; on which, at an early age, little dependence can be placed. Their treatment from the time they are weaned, in July or August, until the time of shearing, the first week in June, consists in giving them every indulgence of keep, in order to push them forward for the show; it being the common practice to let such as are fit to be let the first season, while they are yet yearlings—provincially 'sharhogs.'

"Their first pasture, after weaning, is pretty generally, I believe, clover that has been mown early, and has got a second time into head; the heads of clover being considered as a most forcing food of sheep. After this goes off, turnips, cabbages, colewort, with hay, and (report says) with corn. But the use of this the breeders severally deny, though collectively they may be liable to the charge.

"Be this as it may, something considerable depends on the *art of making up*, not lambs only, but rams of all ages. Fat, like charity, covers a multitude of faults; and besides, is the best evidence of their fatting quality which their owners can produce (*i. e.* their natural propensity to a state of fatness), while in the fatness of the sharhogs is seen their degree of inclination to fat at an early age.

"Fatting quality being the one thing needful in grazing stock, and being found, in some considerable degree at least, to be hereditary, the fattest rams are of course the best; though other attachments, well or ill placed, as to form or fashionable points, will perhaps have equal or greater weight in the minds of some men, even in this enlightened age. Such shearlings as will not make up sufficiently as to form and fatness, are either kept on to another year to give them a fair chance, or are castrated, or butchered while sharhogs."

11
What sums Mr Bakewell received for letting them.

From the first letting, about 40 years ago, to the year 1780, the prices kept gradually rising from fifteen shillings to a guinea, and from one to ten. In 1780 Mr Bakewell let several at ten guineas each; and, what is rather inexplicable, Mr Parkinson of Quarndon let one the same year for twenty five guineas; a price which then astonished the whole country.

From that time to 1786 Mr Bakewell's stock rose rapidly from ten to a hundred guineas; and that year he let two thirds of one ram (reserving one third of the usual number of ewes to himself) to two principal breeders, for a hundred guineas each, the entire services of the ram being rated at three hundred guineas! Mr Bakewell making that year, by letting twenty rams only, more than a thousand pounds!

Since that time the prices have been still rising. Four hundred guineas have been repeatedly given. Mr Bakewell, this year (1789) makes, says Mr Marshall, twelve hundred guineas by three rams (brothers, we believe); two thousand of seven; and of his whole letting, full three thousand guineas!

Besides this extraordinary sum made by Mr Bakewell, there are six or seven other breeders who make from five hundred to a thousand guineas each. The whole amount of monies produced that year in the Midland Counties, by letting rams of the modern breed for one season only, is estimated, by those who are adequate to the subject, at the almost incredible sum of ten thousand pounds.

12
The treatment of the rams and choice of the ewes.

Rams previous to the season are reduced from the cumbrous fat state in which they are shown. The usual time of sending them out is the middle of September. They are conveyed in carriages of two wheels with springs, or hung in slings, 20 or 30 miles a-day, sometimes to the distance of 200 or 300 miles. They are not turned loose among the ewes, but kept apart in a small enclosure, where a couple of ewes only are admitted at once. When the season is over every care is taken to make the rams look as fat and handsome as possible.

In the choice of ewes the breeder is led by the same criterions as in the choice of rams. Breed is the first object of consideration. Excellency, in any species or variety of live stock, cannot be attained with any degree of certainty, let the male be ever so excellent, unless the females employed likewise inherit a large proportion of the genuine blood, be the species or variety what it may. Hence no prudent man ventures to give the higher prices for the Dishley rams, unless his ewes are deeply tinctured with the Dishley blood. Next to breed is flesh, fat, form, and wool.

After the lambs are weaned, the ewes are kept in common feeding places, without any alteration of pasture,

Sheep. ture, previous to their taking the ram. In winter they are kept on grass, hay, turnips, and cabbages. As the heads of the modern breed are much finer than most others, the ewes lamb with less difficulty.

The female lambs, on being weaned, are put to good keep, but have not such high indulgence shown them as the males, the prevailing practice being to keep them from the ram the first autumn.

At weaning time, or previously to the admission of the ram, the ewes are culled, to make room for the thaves or shearlings, whose superior blood and fashion entitle them to a place in the breeding flock. In the work of culling, the ram-breeder and the mere grazier go by somewhat different guides. The grazier's guide is principally age, seldom giving his ewes the ram after they are four shear. The ram-breeder, on the contrary, goes chiefly by merit; an ewe that has brought him a good ram or two is continued in the flock so long as she will breed. There are instances of ewes having been prolific to the tenth or twelfth year; but in general the ewes of this breed go off at six or seven shear.

In the practice of some of the principal ram-breeders, the culling ewes are never suffered to go out of their hands until after they are slaughtered, the breeders not only fatting them, but having them butchered, on their premises. There are others, however, who sell them; and sometimes at extraordinary prices. Three, four, and even so high as ten, guineas each have been given for these outcasts.

There are in the flocks of several breeders ewes that would fetch at auction twenty guineas each. Mr Bakewell is in possession of ewes which, if they were now put up to be sold to the best bidder, would, it is estimated, fetch no less than fifty each, and perhaps, through the present spirit of contention, much higher prices.

13
Instructions for purchasing sheep. The following instructions for purchasing sheep, we hope, will be acceptable to our country readers.—The farmers should always buy his sheep from a worse land than his own, and they should be big-boned, and have a long greasy wool, curling close and well. These sheep always breed the finest wool, and are also the most approved of by the butcher for sale in the market. For the choice of sheep to breed, the ram must be young, and his skin of the same colour with his wool, for the lambs will be of the same colour with his skin. He should have a large long body; a broad forehead, round, and well rising; large eyes; and straight and short nostrils. The polled sheep, that is, those which have no horns, are found to be the best breeders. The ewe should have a broad back; a large bending neck; small, but short, clean, and nimble legs; and a thick, deep wool covering her all over.

To know whether they be sound or not, the farmer should examine the wool that none of it be wanting, and see that the gums be red, the teeth white and even, and the brisket-skin red, the wool firm, the breath sweet, and the feet not hot. Two years old is the best time for beginning to breed; and their first lambs should not be kept too long, to weaken them by suckling, but be sold as soon as conveniently may be. They will breed advantageously till they are seven years old. The farmers have a method of knowing the age of a sheep, as a horse is known, by the mouth. When a sheep is one shear, as they express it, it has two broad teeth before: when it is two shear, it will have four; when three, six; and when four, eight. After this their mouths begin to break.

The difference of land makes a very great difference in the sheep. The fat pastures breed straight tall sheep, and the barren hills and downs breed square short ones; woods and mountains breed tall and slender sheep; but the best of all are those bred upon new-ploughed land and dry grounds. On the contrary, all wet and moist lands are bad for sheep, especially such as are subject to be overflowed, and to have sand and dirt left on them. The salt marshes are, however, an exception to this general rule, for their saltness makes amends for their moisture; salt, by reason of its drying quality, being of great advantage to sheep.

14
When rams ought to be admitted to the ewes. As to the time of putting the rams to the ewes, the farmer must consider at what time of the spring his grass will be fit to maintain them and their lambs, and whether he has turnips to do it till the grass comes; for very often both the ewes and lambs are destroyed by the want of food; or if this does not happen, if the lambs are only stinted in their growth by it, it is an accident that they never recover. The ewe goes 20 weeks with lamb, and according to this it is easy to calculate the proper time. The best time for them to yean is in April, unless the owner has very forward grass or turnips, or the sheep are field sheep. Where you have not enclosures to keep them in, then it may be proper they should yean in January, that the lambs may be strong by May-day, and be able to follow the dam over the fallows and water-furrows; but then the lambs that come so early must have a great deal of care taken of them, and so indeed should all other lambs at their first falling, else while they are weak the crows and magpies will pick their eyes out.

When the sheep are turned into fields of wheat or rye to feed, it must not be too rank at first, for if it be, it generally throws them into scourings. Ewes that are big should be kept but bare, for it is very dangerous to them to be fat at the time of their bringing forth their young. They may be well fed, indeed, like cows, a fortnight beforehand, to put them in heart. Mortimer's Husbandry, p. 243.

The feeding sheep with turnips is one great advantage to the farmers. When they are made to eat turnips they soon fatten, but there is some difficulty in bringing this about. The old ones always refuse them at first, and will sometimes fast three or four days, till almost famished; but the young lambs fall to at once. The common way, in some places, of turning a flock of sheep at large into a field of turnips, is very disadvantageous, for they will thus destroy as many in a fortnight as would keep them a whole winter. There are three other ways of feeding them on this food, all of which have their several advantages.

1
The first way of feeding sheep on turnips. The first way is to divide the land by hurdles, and allow the sheep to come upon such a portion only at a time as they can eat in one day, and so advance the hurdles farther into the ground daily till all be eaten. This is infinitely better than the former random method; but they never eat them clean even this way, but leave the bottoms and outsides scooped in the ground: the people pull up these indeed with iron crooks, and lay them before the sheep again, but they are commonly

Sheep

ly ſo fouled with the creature's dung and urine, and with the dirt from their feet, that they do not care for them; they eat but little of them, and what they do eat does not nouriſh them like the freſh roots.

16 ...e fe-d.

The ſecond way is by encloſing the ſheep in hurdles, as in the former; but in this they pull up all the turnips which they ſuppoſe the ſheep can eat in one day, and daily remove the hurdles over the ground whence they have pulled up the turnips: by this means there is no waſte, and leſs expence, for a perſon may in two hours pull up all thoſe turnips; the remaining ſhells of which would have employed three or four labourers a-day to get up with their crooks out of the ground trodden hard by the feet of the ſheep; and the worſt is, that as in the method of pulling up firſt, the turnips are eaten up clean; in this way, by the hook, they are waſted, the ſheep do not eat any great part of them, and when the ground comes to be tilled afterwards for a crop of corn, the fragments of the turnips are ſeen in ſuch quantities on the ſurface, that half the crop at leaſt ſeems to have been waſted.

17 ...e third, ...ich is beſt.

The third manner is to pull up the turnips and remove them in a cart or waggon to ſome other place, ſpreading them on a freſh place every day; by this method the ſheep will eat them up clean, both root and leaves. The great advantage of this method is, when there is a piece land not far off which wants dung more than that where the turnips grew, which perhaps is alſo too wet for the ſheep in winter, and then the turnips will, by the too great moiſture and dirt of the ſoil, ſometimes ſpoil the ſheep, and give them the rot. Yet ſuch ground will often bring forth more and larger turnips than dry land, and when they are carried off, and eaten by the ſheep on ploughed land, in dry weather, and on green ſward in wet weather, the ſheep will ſucceed much better; and the moiſt ſoil where the turnips grew not being trodden by the ſheep, will be much fitter for a crop of corn than if they had been fed with turnips on it. The expence of hurdles, and the trouble of moving them, are ſaved in this caſe, which will counterbalance at leaſt the expence of pulling the turnips and carrying them to the places where they are to be eaten. They muſt always be carried off for oxen.

18 ...ſeaſes of ...ep.

The diſeaſes to which ſheep are ſubject are theſe, rot, red-water, foot-rot and hoving, ſcab, dunt, rickets, fly-ſtruck, flux, and burſting. Of each of theſe we ſhall give the beſt deſcription in our power, with the moſt approved remedies.

19 ...e rot.

The *rot*, which is a very pernicious diſeaſe, has of late engaged the attention of ſcientific farmers. But neither its nature nor its cauſe has yet been fully aſcertained. Some valuable and judicious obſervations have, however, been made upon it, which ought to be circulated, as they may perhaps, in many caſes, furniſh an antidote for this malignant diſtemper, or be the means of leading others to ſome more efficacious remedy. Some have ſuppoſed the rot owing to the quick growth of graſs or herbs that grow in wet places. Without premiſing, that all bounteous Providence has given to every animal its peculiar taſte, by which it diſtinguiſhes the food proper for its preſervation and ſupport, if not vitiated by fortuitous circumſtances, it ſeems very difficult to diſcover on philoſophical principles why the quick growth of graſs ſhould render it noxious, or why any herb ſhould at one ſeaſon produce fatal effects, by the admiſſion of pure water only into its component parts, which at other times is perfectly innocent, although brought to its utmoſt ſtrength and maturity by the genial influence of the ſun. Beſides, the conſtant practice of moſt farmers in the kingdom, who with the greateſt ſecurity feed their meadows in the ſpring, when the graſs ſhoots quick and is full of juices, militates directly againſt this opinion.

Sheep.

Mr Arthur Young, to whom agriculture is much indebted, aſcribes this diſeaſe to moiſture. In confirmation of this opinion, which has been generally adopted, we are informed, in the Bath Society papers *, by a correſpondent, that there was a paddock adjoining to his park which had for ſeveral years cauſed the rot in moſt of the ſheep which were put into it. In 1769 he drained it, and from that time his ſheep were free from this malady. But there are facts which render it doubtful that moiſture is the ſole cauſe. We are told, the dry limed land in Derbyſhire will produce the rot as well as water meadows and ſtagnant marſhes; and that in ſome wet grounds ſheep ſuſtain no injury for many weeks.

* Vol. I. Art. xlvi.

20 ...he cauſe.

Without attempting to enumerate other hypotheſes which the ingenious have formed on this ſubject, we ſhall purſue a different method in order to diſcover the cauſe. On different ſheep that die of this diſorder, a great number of inſects called *flukes* (ſee FASCIOLA) are found in the liver. That theſe flukes are the cauſe of the rot, therefore, is evident; but to explain how they come into the liver is not ſo eaſy. It is probable that they are ſwallowed by the ſheep along with their food while in the egg ſtate. The eggs depoſited in the tender germ are conveyed with the food into the ſtomach and inteſtines of the animals, whence they are received into the lacteal veſſels, carried off in the chyle, and paſs into the blood; nor do they meet with any obſtruction until they arrive at the capillary veſſels of the liver. Here, as the blood filtrates through the extreme branches, anſwering to thoſe of the *vena porta* in the human body, the ſecerning veſſels are too minute to admit the impregnated ova, which, adhering to the membrane, produce thoſe animalculæ that feed upon the liver and deſtroy the ſheep. They much reſemble the flat fiſh called plaice, are ſometimes as large as a ſilver two-pence, and are found both in the liver and in the pipe (anſwering to that of the *vena cava*) which conveys the blood from the liver to the heart.

The common and moſt obvious objection to that opinion is, that this inſect is never found but in the liver, or in ſome parts of the viſcera, of ſheep that are diſeaſed more or leſs; and that they muſt therefore be bred there. But this objection will loſe its force, when we conſider that many inſects undergo ſeveral changes, and exiſt under forms extremely different from each other. Some of them may therefore appear and be well known under one ſhape, and not known to be the ſame under a ſecond or third. The fluke may be the laſt ſtate of ſome aquatic animal which we at preſent very well know under one or other of its previous forms.

If this be admitted, it is eaſy to conceive that ſheep may, on wet ground eſpecially, take multitudes of theſe ova or eggs in with their food; and that the ſtomach and viſcera of the ſheep being a proper nidus for them, they of courſe hatch, and appearing in their fluke

or

Sheep. or last state, feed on the liver of the animal, and occasion this disorder.

It is a singular fact, "that no ewe ever has the rot while she has a lamb by her side." The reason of this may be, that the impregnated ovum passes into the milk, and never arrives at the liver. The rot is fatal to sheep, hares, and rabbits, and sometimes to calves; but never infests animals of a larger size.

21 and most approved cures.

Miller says that parsley is a good remedy for the rot in sheep. Perhaps a strong decoction of this plant, or the oil extracted from its seeds, might be of service. Salt is also a useful remedy. It seems to be an acknowledged fact that salt marshes never produce the rot. Salt indeed is pernicious to most insects. Common salt and water expel worms from the human body; and sea-weed, if laid in a garden, will drive away insects; but if the salt is separated by steeping it in the purest spring-water for a few days, it abounds with animalculæ of various species.

Lisle, in his book of husbandry, informs us of a farmer who cured his whole flock of the rot by giving each sheep a handful of Spanish salt for five or six mornings successively. The hint was probably taken from the Spaniards, who frequently give their sheep salt to keep them healthy. On some farms perhaps the utmost caution cannot always prevent this disorder. In wet and warm seasons the prudent farmer will remove his sheep from the lands liable to rot. Those who have it not in their power to do this may give each sheep a spoonful of common salt, with the same quantity of flour, in a quarter of a pint of water, once or twice a-week. When the rot is recently taken, the same remedy given four or five mornings successively will in all probability effect a cure. The addition of the flour and water (in the opinion of Mr Price of Salisbury, to whose excellent paper in the Bath Society's Transactions we own ourselves much indebted) will not only abate the pungency of the salt, but dispose it to mix with the chyle in a more gentle and efficacious manner.

A farmer of a considerable lordship in Bohemia visiting the hot-wells of Carlsbad, related how he preserved his flock of sheep from the mortal distemper which raged in the wet year 1769, of which so many perished. His preservative was very simple and very cheap: "He fed them every night, when turned under a shed, cover, or stables, with hashed fodder straw; and, by eating it greedily, they all escaped."

22 Red-water.

"*Red-water* is a disorder most prevalent on wet grounds. I have heard (says Mr Arthur Young) that it has sometimes been cured by tapping, as for a dropsy. This operation is done on one side of the belly towards the flank, just below the wool.

23 Foot rot.

"*The foot-rot* and *hoving*, which is very common on low fenny grounds, is cured by keeping the part clean, and lying at rest in a dry pasture."

24 Scab.

The *scab* is a cutaneous disease owing to an impurity of the blood, and is most prevalent in wet lands or in rainy seasons. It is cured by tobacco-water, brimstone, and alum, boiled together, and then rubbed over the sheep. If only partial, tar and grease may be sufficient. But the simplest and most efficacious remedy for this disease was communicated to the Society for the Encouragement of Arts, &c. by Sir Joseph Banks. 25

Remedy communicated by Sir Joseph Banks.

"Take one pound of quicksilver, half a pound of Venice turpentine, half a pint of oil of turpentine, and four pounds of hogs lard (c). Let them be rubbed in a mortar till the quicksilver is thoroughly incorporated with the other ingredients; for the proper mode of doing which, it may be proper to take the advice, or even the assistance, of some apothecary or other person used to make such mixtures.

"The method of using the ointment is this: Beginning at the head of the sheep, and proceeding from between the ears along the back to the end of the tail, the wool is to be divided in a furrow till the skin can be touched; and as the furrow is made, the finger slightly dipped in the ointment is to be drawn along the bottom of it, where it will leave a blue stain on the skin and adjoining wool: from this furrow similar ones must be drawn down the shoulders and thighs to the legs, as far as they are woolly; and if the animal is much infected, two more should be drawn along each side parallel to that on the back, and one down each side between the fore and hind legs.

"Immediately after being dressed, it is usual to turn the sheep among other stock, without any fear of the infection being communicated; and there is scarcely an instance of a sheep suffering any injury from the application. In a few days the blotches dry up, the itching ceases, and the animal is completely cured: it is generally, however, thought proper not to delay the operation beyond Michaelmas.

"The *hippobosca ovina*, called in Lincolnshire *sheep fagg*, an animal well known to all shepherds, which lives among the wool, and is hurtful to the thriving of sheep both by the pain its bite occasions and the blood it sucks, is destroyed by this application, and the wool is not at all injured. Our wool-buyers purchase the fleeces on which the stain of the ointment is visible, rather in preference to others, from an opinion that the use of it having preserved the animal from being vexed either with the scab or faggs, the wool is less liable to the defects of joints or knots; a fault observed to proceed from every sudden stop in the thriving of the animal, either from want of food or from disease.

"This mode of curing was brought into that part of Lincolnshire where my property is situated about 12 years ago, by Mr Stephenson of Mareham, and is now so generally received, that the scab, which used to be the terror of the farmers, and which frequently deterred the more careful of them from taking the advantage of pasturing their sheep in the fertile and extensive commons with which that district abounds, is no longer regarded with any apprehension: by far the most of them have their flock anointed in autumn, when they return from the common, whether they show any symptoms of scab or not; and having done so, conclude them

(c) By some unaccountable mistake the last ingredient, the four pounds of hogs lard, is omitted in the receipt published in the Transactions of the Society; a circumstance that might be productive of bad effects.—The leaf which contained the receipt has since been cancelled, and a new one printed.

Sheep. them safe for sume time from either giving or receiving infection. There are people who employ themselves in the business, and contract to anoint our large sheep at five shillings a score, ensuring for that price the success of the operation; that is, agreeing, in case many of the sheep break out afresh, to repeat the operation gratis even some months afterwards."

26 The dunt, The *dunt* is a distemper caused by a bladder of water gathering in the head. No cure for this has yet been discovered.

27 Rickets, The *rickets* is a hereditary disease for which no antidote is known. The first symptom is a kind of lightheadedness, which makes the affected sheep appear wilder than usual when the shepherd or any person approaches him. He bounces up suddenly from his lair, and runs to a distance, as though he were pursued by dogs. In the second stage the principal symptom is the sheep rubbing himself against trees, &c. with such fury as to pull off his wool and tear away his flesh. "The distressed animal has now a violent itching in his skin, the effect of a highly inflamed blood; but it does not appear that there is ever any cutaneous eruption or salutary critical discharge. In short, from all circumstances, the fever appears now to be at its height." The last stage of this disease "seems only to be the progress of dissolution, after an unfavourable crisis. The poor animal, is condemned by Nature, appears stupid, walks irregularly (whence probably the name *rickets*), generally lies, and eats little: these symptoms increase in degree till death, which shows a general consumption, as appears upon dissection of the carcass; the juices and even solids having suffered a great dissolution."

In order to discover the seat and nature of this disease, sheep that die of it ought to be dissected. This is said to have been done by one gentlemen, Mr Beal; and he found in the brain or membranes adjoining a maggot about a quarter of an inch long, and of a brownish colour. A few experiments might easily determine this fact.

28 Fly-struck, The *fly-struck*, is cured by clipping the wool off as far as infected, and rubbing the parts dry with lime or wood-ashes; curriers oil will heal the wounds, and prevent their being struck any more; or they may be cured with care without clipping, with oil of turpentine, which will kill all the vermine where it goes; but the former is the surest way.

29 Flux, The *flux* is another disease to which sheep are subject. The best remedy is said to be, to house the sheep immediately when this distemper appears, to keep them very warm, and feed them on dry hay, giving them frequent glisters of warm milk and water. The cause of that distemper is either their feeding on wet lands, or on grass that is become mossy by the lands having been fed many years without being ploughed. When the farmer perceives his sheep-walks to become mossy, or to produce bad grass, he should either plough or manure with hot lime, making kilns either very near or in the sheep walks, because the hotter the lime is put on, the sweeter the grass comes up, and that early in the year.

30 and bursting. *Bursting*, or as it is called in some places the *blast*, attacks sheep when driven into fresh grass or young clover. They overeat themselves, foam at the mouth, swell exceedingly, breathe very quick and short, then jump up, and instantly fall down dead. In this case, the only chance of saving their life is by stabbing them in the maw with an instrument made for the purpose. The instrument is a hollow tube, with a pointed weapon passing through it. A hole is made with the pointed weapon; which is immediately withdrawn, and the hole is kept open by inserting the tube till the wind is discharged.

31 Account of the nose-worms which infest sheep. Sheep are infested with worms in their nose called *œstrus oves*, and produced from the egg of a large two-winged fly. The frontal sinuses above the nose in sheep and other animals are the places where these worms live and attain their full growth. These sinuses are always full of a white soft matter, which furnishes these worms with a proper nourishment, and are sufficiently large for their habitation; and when they have here acquired their destined growth, in which they are fit to undergo their changes for the fly-state, they leave their old habitation, and, falling to the earth, bury themselves there; and when these are hatched into flies, the female, when she has been impregnated by the male, knows that the nose of a sheep or other animal is the only place for her to deposite her eggs in order to their coming to maturity. Mr Vallisnieri, to whom the world owes so many discoveries in the insect class, is the first who has given any true account of the origin of these worms. But though their true history had been till that time unknown, the creatures themselves were very early discovered, and many ages since were esteemed great medicines in epilepsies.

The fly produced from this worm has all the time of its life a very lazy disposition, and does not like to make any use either of its legs or wings. Its head and corselet together are about as long as its body, which is composed of five rings, streaked on the back; a pale yellow or brown are there disposed in irregular spots; the belly is of the same colours, but they are there more regularly disposed, for the brown here makes three lines, one in the middle, and one on each side, and all the intermediate spaces are yellow. The wings are nearly of the same length with the body, and are a little inclined in their position, so as to lie upon the body: they do not, however, cover it; but a naked space is left between them. The ailerons or petty wings which are found under each of the wings are of a whitish colour, and perfectly cover the balances, so that they are not to be seen without lifting up these.

The fly will live two months after it is first produced, but will take no nourishment of any kind; and possibly it may be of the same nature with the butterflies, which never take any food during the whole time of their living in that state. Reamur, Hist. Inf. Vol. IV. p. 552, &c.

32 Composition for marking sheep. To find a proper composition for marking sheep is a matter of great importance, as great quantities of wool are every year rendered useless by the pitch and tar with which they are usually marked. The requisite qualities for such a composition are, that it be cheap, that the colour be strong and lasting, so as to bear the changes of weather, and not to injure the wool. Dr Lewis recommends for this purpose melted tallow, with so much charcoal in fine powder stirred into it as is sufficient to make it of a full black colour, and of a thick consistence. This mixture, being applied warm with a marking iron on pieces of flannel, quickly fixed or hardened, bore moderate rubbing, resisted the sun and rain, and

and yet could be waſhed out freely with ſoap, or ley, or ſtale urine. In order to render it ſtill more durable, and prevent its being rubbed off, with the tallow may be melted an eighth, ſixth, or fourth, of its weight of tar, which will readily waſh out along with it from the wool. Lewis's Com. Phil. Techn. p. 361,

Sheep-Stealing. See Theft.

SHEERING, in the ſea-language. When a ſhip is not ſteered ſteadily, they ſay ſhe ſheers, or goes ſheering; or when, at anchor, ſhe goes in and out by means of the current of the tide, they alſo ſay ſhe ſheers.

SHEERNESS, a fort in Kent, ſeated on the point where the river Medway falls into the Thames. It was built by King Charles II. after the inſult of the Dutch, who burnt the men of war at Chatham. The buildings belonging to it, in which the officers lodge, make a pretty little neat town; and there is alſo a yard and a dock, a chapel and chaplain. Mr Lyons, who failed with the Honourable Captain Phipps in his voyage towards the pole, fixed the longitude of Sheerneſs to 0. 48′. E. its latitude 51° 25′.

SHEERS, a name given to an engine uſed to hoiſt or diſplace the lower maſts of a ſhip. The ſheers employed for this purpoſe in the royal navy are compoſed of ſeveral long maſts, whoſe heels reſt upon the ſide of the hulk, and having their heads declining outward from the perpendicular, ſo as to hang over the veſſel whoſe maſts are to be fixed or replaced. The tackles, which extend from the head of the maſt to the ſheer-heads, are intended to pull in the latter toward the maſt-head, particularly when they are charged with the weight of a maſt after it is raiſed out of any ſhip, which is performed by ſtrong tackles depending from the ſheer-heads. The effort of theſe tackles is produced by two capſterns, fixed on the deck for this purpoſe.

In merchant ſhips this machine is compoſed of the maſts or props, erected in the ſame veſſel wherein the maſt is to be planted, or from whence it is to be removed. The lower ends of theſe props reſt on the oppoſite ſides of the deck, and their upper parts are faſtened acroſs, ſo as that a tackle which hangs from the interſection may be almoſt perpendicularly above the ſtation of the maſt to which the mechanical powers are applied. Theſe ſheers are ſecured by ſtays, which extend forward and aft to the oppoſite extremities of the veſſel.

SHEET-Lead. See Plumbery.

Sheet, in ſea language, a rope faſtened to one or both the lower corners of a ſail, to extend and retain it in a particular ſtation. When a ſhip ſails with a lateral wind, the lower corners of the main and foreſail are faſtened by a tack and a ſheet; the former being to windward, and the latter to leeward; the tack, however, is entirely diſuſed with a ſtern wind, whereas the ſail is never ſpread without the aſſiſtance of one or both of the ſheets. The ſtay ſails and ſtudding-ſails have only one tack and one ſheet each: the ſtay-ſail tacks are always faſtened forward, and the ſheet drawn aft; but the ſtudding-ſail tack draws the under clue of the ſail to the extremity of the boom, whereas the ſheet is employed to extend the inmoſt.

SHEFFIELD, a town in the weſt riding of Yorkſhire, about 162 miles from London, is a large, thriving, populous town on the borders of Derbyſhire; has a fine ſtone bridge over the Don, and another over the Sheaf, and a church built in the reign of Henry I. It had a caſtle built in the reign of Henry III. in which, or elſe in the manor houſe of the Park, Mary Queen of Scots was priſoner 16 or 17 years; but after the death of Charles I. it was, with ſeveral others, by order of parliament demoliſhed. In 1673 an hoſpital was erected here, and endowed with 200l. a year. There is a charity-ſchool for 30 boys, and another for 30 girls. This town has been noted ſeveral hundred years for cutlers and ſmiths manufactures, which were encouraged and advanced by the neighbouring mines of iron, particularly for files and knives, or whittles; for the laſt of which eſpecially it has been a ſtaple for above 300 years; and it is reputed to excel Birmingham in theſe wares, as much as it is ſurpaſſed by it in locks, hinges, nails, and poliſhed ſteel. The firſt mills in England for turning grindſtones were alſo ſet up here. The houſes look black from the continual ſmoke of the forges. Here are 600 maſter cutlers, incorporated by the ſtyle of the *Cutlers of Hallamſhire* (of which this is reckoned the chief town), who employ not leſs than 40,000 perſons in the iron manufactures; and each of the maſters gives a particular ſtamp to his wares. There is a large market on Tueſday for many commodities, but eſpecially for corn, which is bought up here for the whole Weſt Riding, Derbyſhire, and Nottinghamſhire. It has fairs on Tueſday after Trinity-Sunday, and November 28. In the new market place, erected by the duke of Norfolk, the ſhambles are built upon a moſt excellent plan, and ſtrongly encloſed. There are ſeveral other new good buildings, ſuch as a large and elegant octagon chapel belonging to the hoſpital or almshouſes; likewiſe a good aſſembly-room and theatre. We muſt not omit the large ſteam engine, lately finiſhed, for the purpoſe of poliſhing and grinding the various ſorts of hardware. The pariſh being very large, as well as populous, Mary I. incorporated 12 of the chief inhabitants, and their ſucceſſors for ever, by the ſtyle of the *Twelve Capital Burgeſſes of Sheffield*, empowering them to elect and ordain three prieſts to aſſiſt the vicar, who were to be paid out of certain lands and rents which ſhe gave out of the crown; and ſince this ſettlement two more chapels have been built in two hamlets of this pariſh, which are ſerved by two of the aſſiſtants, while the third, in his turn, helps the vicar in his pariſh church. James I. founded a free grammar ſchool here, and appointed 13 ſchool burgeſſes to manage the revenue, and appoint the maſter and uſher. A new chapel was built lately by the contributions of the people of the town and of the neighbouring nobility and gentry. Water is conveyed by pipes into Sheffield, whoſe inhabitants pay but a moderate rent for it. In the neighbourhood there are ſome mines of alum. The remains of the Roman fortification between this town and Rotheram, which is ſix miles lower down the river, are ſtill viſible; and here is alſo the famous trench of five miles long, by ſome called *Devil's* or *Dane's Bank*, and by others *Kemp Bank* and *Temple's Bank*. W. Long. 1. 29. N. Lat. 53. 20.

Sheffield (John), duke of Buckinghamſhire, an eminent writer of the laſt and preſent century, of great perſonal bravery, and an able miniſter of ſtate, was born about 1650. He loſt his father at nine years of age; and his mother marrying Lord Offulſton, the care of his education was left entirely to a governor, who did not greatly improve him in his ſtudies. Finding that he was deficient in many parts of

of literature, he reſolved to devote a certain number of hours every day to his ſtudies; and thereby improved himſelf to the degree of learning he afterwards attained. Though poſſeſſed of a good eſtate, he did not abandon himſelf to pleaſure and indulence, but entered a volunteer in the ſecond Dutch war; and accordingly was in that famous naval engagement where the duke of York commanded as admiral: on which occaſion his lordſhip behaved ſo gallantly, that he was appointed commander of the Royal Catharine. He afterward made a campaign in the French ſervice under M. de Turenne. As Tangier was in danger of being taken by the Moors, he offered to head the forces which were ſent to defend it: and accordingly was appointed to command them. He was then earl of Mulgrave, and one of the lords of the bedchamber to King Charles II. The Moors retired on the approach of his majeſty's forces; and the reſult of the expedition was the blowing up of Tangier. He continued in ſeveral great poſts during the ſhort reign of King James II. till that unfortunate prince was dethroned. Lord Mulgrave, though he paid his reſpects to King William before he was advanced to the throne, yet did not accept of any poſt in the government till ſome years after. In the ſixth year of William and Mary he was created marquis of Normanby in the county of Lincoln. He was one of the moſt active and zealous oppoſers of the bill which took away Sir John Fenwick's life; and exerted the utmoſt vigour in carrying through the Treaſon Bill, and the bill for Triennial Parliaments. He enjoyed ſome conſiderable poſts under King William, and enjoyed much of his favour and confidence. In 1702 he was ſworn lord privy-ſeal; and in the ſame year was appointed one of the commiſſioners to treat of an union between England and Scotland. In 1703 he was created duke of Normanby, and ſoon after duke of Buckinghamſhire. In 1711 he was made ſteward of her majeſty's houſehold, and preſident of the council. During Queen Anne's reign he was but once out of employment; and then he voluntarily reſigned, being attached to what were called the *Tory principles*. Her majeſty offered to make him lord chancellor; but he declined the office. He was inſtrumental in the change of the miniſtry in 1710. A circumſtance that reflects the higheſt honour on him is, the vigour with which he acted in favour of the unhappy Catalans, who afterward were ſo inhumanly ſacrificed. He was ſurvived by only one legitimate ſon (who died at Rome in 1735); but left ſeveral natural children. His worſt enemies allow that he lived on very good terms with his laſt wife, natural daughter to King James II. the late ducheſs of Buckingham, a lady who always behaved with a dignity ſuitable to the daughter of a king. He died in 1721. He was admired by the poets of his age; by Dryden, Prior, and Garth. His Eſſay on Poetry was applauded by Addiſon, and his Rehearſal is ſtill read with pleaſure. His writings were ſplendidly printed in 1723, in two volumes 4to; and have ſince been reprinted in 1729, in two vols. 8vo. The firſt contains his poems on various ſubjects; the ſecond, his proſe works; which conſiſt of hiſtorical memoirs, ſpeeches in parliament, characters, dialogues, critical obſervations, eſſays, and letters. It may be proper to obſerve, that the edition of 1729 is caſtrated; ſome particulars relating to the Revolution in that of 1723 having given offence.

SHEFFIELDIA, in botany; a genus of plants belonging to the claſs of pentandria, and to the order of monogynia. The corolla is bell-ſhaped; the filaments are 10, of which every ſecond is barren. The capſule conſiſts of one cell, which has four valves. There is only one ſpecies, the *repens*.

SHEIK, in the oriental cuſtoms, the perſon who has the care of the moſques in Egypt; his duty is the ſame as that of the imams at Conſtantinople. There are more or fewer of theſe to every moſque, according to its ſize or revenue. One of theſe is head over the reſt, and anſwers to a pariſh-prieſt with us; and has under him, in large moſques, the readers, and people who cry out to go to prayers; but in ſmall moſques the ſheik is obliged to do all this himſelf. In ſuch it is their buſineſs to open the moſque, to cry to prayers, and to begin their ſhort devotions at the head of the congregation, who ſtand rank and file in great order, and make all their motions together. Every Friday the ſheik makes a harangue to his congregation.

Sheik-Bellet, the name of an officer in the Oriental nations. In Egypt the ſheik-bellet is the head of a city, and is appointed by the pacha. The buſineſs of this officer is to take care that no innovations be made which may be prejudicial to the porte, and that they ſend no orders which may hurt the liberties of the people. But all his authority depends on his credit and intereſt, not his office: for the government of Egypt is of ſuch a kind, that often the people of the leaſt power by their poſts have the greateſt influence: and a caia of the janizaries or Arabs, and ſometimes one of their meaneſt officers, and oda-baſha, finds means, by his parts and abilities, to govern all things.

SHEILDS. See Shields.

SHEKEL, the name of a weight and coin current among the ancient Jews. Dr Arbuthnot makes the weight of the ſhekel equal to 9 pennyweights $2\frac{4}{7}$ grains troy weight; and the value equal to 2s. $3\frac{3}{8}$d. ſterling. The golden ſhekel was worth 1l. 16s. 6d.

SHELDRAKE, in ornithology. See Anas.

SHELF, among miners, the ſame with what they otherwiſe call *faſt ground* or *faſt country*; being that part of the internal ſtructure of the earth which they find lying even and in an orderly manner, and evidently retaining its primitive form and ſituation.

SHELL, in natural hiſtory, a hard, and, as it were, ſtony covering, with which certain animals are defended, and thence called *ſhell-fiſh*.

1 Formation of ſhells.

The ſingular regularity, beauty, and delicacy in the ſtructure of the ſhells of animals, and the variety and brilliancy in the colouring of many of them, at the ſame time that they ſtrike the attention of the moſt incurious obſervers, have at all times excited philoſophers to inquire into and detect, if poſſible, the cauſes and manner of their formation. But the attempts of naturaliſts, ancient and modern, to diſcover this proceſs, have conſtantly proved unſucceſsful. M. de Reaumur hitherto appears alone to have given a plauſible account, at leaſt, of the formation of the ſhell of the garden-ſnail in particular, founded on a courſe of very ingenious experiments, related in the Paris Memoirs*. He there endeavours to ſhow, that this ſubſtance is produced merely by the perſpirable matter of the animal condenſing and afterwards hardening on its ſurface, and accordingly taking the figure of its body, which has performed the office of a mould to it; in ſhort, that the ſhell of a ſnail, and, as he ſuppoſed, of all other animals poſſeſſed

* See Mem. de l'Acad. anné 1709. p. 475. Edit. de Holl. de in 12mo.

fessed of shells, was only the product of a viscous transudation from the body of the animal, containing earthy particles united by mere juxtaposition. This hypothesis, however, is liable to very great and unsurmountable difficulties, if we apply it to the formation of some of the most common shells: for how, according to this system, it may be asked, can the oyster, for instance, considered simply as a mould, form to itself a covering so much exceeding its own body in dimensions?

2
Are composed of an earthy and an animal substance.

M. Herissant, in the Memoirs of the Academy of Sciences for 1766, has discovered the structure of shells to be organical. In the numerous experiments that he made on an immense number, and a very great variety, of animal shells, he constantly found that they were composed of two distinct substances; one of which is a cretaceous or earthy matter; and the other appeared, from many experiments made upon it by burning, distillation, and otherwise, to be evidently of an animal nature. These two substances he dexterously separated from each other by a very easy chemical analysis; by the gentle operation of which they were exhibited distinctly to view, without any material alteration from the action of the solvent, or instrument employed for that purpose. On an entire shell or a fragment of one, contained in a glass vessel, he poured a sufficient quantity of the nitrous acid, considerably diluted either with water or spirit of wine. After the liquor has dissolved all the earthy part of the shell (which may be collected after precipitation by a fixed or volatile alkali), there remains floating in it a soft substance, consisting of innumerable membranes of a retiform appearance, and disposed, in different shells, in a variety of positions, which constitutes the animal part of it. This, as it has not been effected by the solvent, retains the exact figure of the shell; and, on being viewed through a microscope, exhibits satisfactory proofs of a vascular and organical structure. He shows that this membraneous substance is an appendix to the body of the animal, or a continuation of the tendinous fibres that compose the ligaments by which it is fixed to its shell; and that this last owes its hardness to the earthy particles conveyed through the vessels of the animal, which fix themselves into, and incrust, as it were, the meshes formed by the reticular filaments of which this membraneous substance is composed. In the shell called *porcelain*, in particular, the delicacy of these membranes was so great, that he was obliged to put it into spirit of wine, to which he had the patience to add a single drop of spirit of nitre day by day, for the space of two months; lest the air generated, or let loose by the action of the acid on the earthy substance, should tear the compages of its fine membraneous structure into shatters; as it certainly would have done in a more hasty and less gentle dissolution. The delicate reticulated film, left after this operation, had all the tenuity of a spider's web; and accordingly he does not attempt to delineate its organization. In other shells he employed even five or six months in demonstrating the complicated membraneous structure of this animal substance by this kind of chemical anatomy. In general, however, the process does not require much time.

3
Their membranous structure produces great variety of colours.

Of the many singular configurations and appearances of the membranous part of different shells, which are described in this memoir, and are delineated in several well executed plates, we shall mention only, as a specimen, the curious membraneous structure observed in the laminæ of mother-of-pearl, and other shells of the same kind, after having been exposed to the operation of the author's solvent. Beside the great variety of fixed or permanent colours with which he found the animal filaments of these shells to be adorned, it is known, that the shell itself presents to the view a succession of rich and changeable colours, the production of which he easily explains from the configurations of their membranes. Nature, he observes, always magnificent in her designs, but singularly frugal in the execution of them, produces these brilliant decorations at a very small expence. The membraneous substance above mentioned is plaited and rumpled, as it were, in such a manner, that its exterior laminæ, incrusted with their earthy and semi-transparent matter form an infinite number of little prisms, placed in all kinds of directions, which refract the rays of light, and produce all the changes of colour observable in these shells.

With respect to the figures and colours of shells, it is observed, that river shells have not so agreeable or diversified a colour as the land and sea shells; but the variety in the figure, colours, and other characters of sea shells, is almost infinite. The number of distinct species we find in the cabinets of the curious is very great; and doubtless the deep bottoms of the sea, and the shores yet unexplored contain multitudes still unknown to us. Even the same species differ in some degree in almost every individual; so that it is rare to find any two shells which are alike in all respects.

4
Whence the most beautiful shells are obtained.

This wonderful variety, however, is not all the produce of one sea or one country; the different parts of the world afford us their different deputies. Bonani observes, that the most beautiful shells we are acquainted with come from the East Indies and from the Red sea. This is in some degree countenanced by what is found to this day; and from the general observations of the curious, it seems, that the sun, by the great heat that it gives to the countries near the line, exalts the colours of the shells produced there, and gives them a lustre and brilliancy that those of colder climates always want: and it may be, that the waters of those vast seas, which are not subject to be weakened by fresh rivers, give a nourishment to the fish, that may add to the brilliancy of their shells.

5
Shells found in Asia.

The shores of Asia furnish us with the pearl-oysters and scallops in great perfection. About Amboyna are found the most beautiful specimens of the cabbage-shell, the arrosair, the ducal mantle, and coral oysters, or echinated oysters. Here also are found a great variety of extremely beautiful muscles, tellinæ, and volutæ; some fine buccinums, and the shell called the *Ethiopian crown*, in its greatest perfection. The dolia, the murices, and the cassandræ, are also found on these coasts in great beauty. Many elegant snail and screw-shells are also brought from thence; and finally, the serapion and spider shells. The Maldive and Philippine islands, Bengal, and the coast of Malabar, abound with the most elegant of all the species of snails, and furnish many other kinds of shells in great abundance and perfection. China abounds in the finest species of of porcelain shells, and has also a great variety of beautiful snails. Japan furnishes us with all the thicker and and larger bivalves; and the isle of Cyprus is famous above all other parts of the world for the beauty and variety of the patella or limpet found there.

America

Shells.

6 In America. America affords many very elegant shells, but neither in so great abundance nor beauty as the shores of Asia. Panama is famous for the cylinders or rhombi, and we have beside, from the same place, some good porcelains, and a very fine species of *dolium*, or *concha globosa*, called from this place the *Panama purple shell*. One of the most beautiful of the cylinders is also known among our naturalists under the name of the *Panama shell*. About Brasil, and in the gulf of Mexico, there are found murices and dolia of extreme beauty; and also a great variety of porcelains, purpuræ, pectens, neritæ, hucardiæ or heart-shells, and elegant limpets. The isle of Cayenne affords one of the most beautiful of the buccinum kind, and the Midas ear is found principally about this place. Jamaica and the island of Barbadoes have their shores covered with porcelains, chamæ, and buccina; and at St Domingo there are found almost all the same species of shells that we have from the East Indies; only they are less beautiful, and the colours more pale and dead. The pearl-oyster is found also on this coast, but smaller than in the Persian gulf. At Martinico there are found in general the same shells as at St Domingo, but yet less beautiful. About Canada are found the violet chamæ, and the lakes of that country abound with muscles of a very elegant pale blue and pale red colours. Some species of these are remarkably light and thin; others are very thick and heavy. The Great Bank of Newfoundland is very barren in shells: the principal kind found there are muscles of several species, some of which are of considerable beauty. About Carthagena there are many mother-of-pearl shells, but they are not of so brilliant colours as those of the Persian gulf. The island of Magellan, at the southern point of America, furnishes us with a very remarkable species of muscle called by its name; and several very elegant species of limpets are found there, particularly the pyramidal.

7 In Africa. In Africa, on the coast of Guinea, there is a prodigious quantity of that small species of porcelain which is used there as money; and there is another species of porcelain on the same coast which is all over white; the women make bracelets of these, and the people of the Levant adorn their hair with them. The coast of Zanguebar is very rich in shells; we find there a vast variety of the large porcelains, many of them of great beauty; and the *nux maris* or sea-nut is very frequent there. Beside these, and many other shells, there are found on this coast all the species of nautili, many of which are very beautiful. The Canary isles abound with a vast variety of the murices, and some other good shells; and we have from Madeira great variety of the echini or sea-eggs different from those of the European seas. Several species of muscles are also common there, and the auris marina is nowhere more abundant. The Red sea is beyond all other parts of the world abundant in shells, scarce any kind is wanting there; but what we principally have from thence are the purpuræ, porcelains, and echini marini.

8 In some islands of the Mediterranean and the coasts surrounding it. The Mediterranean and Northern ocean contain a great variety of shells, and many of very remarkable elegance and beauty; they are upon the whole, however, greatly inferior to those of the East Indies. The Mediterranean abounds much more in shells than the ocean. The gulf of Tarentum affords great variety of purpuræ, of porcelains, nautili, and elegant oysters; the coasts of Naples and Sardinia afford also the same, and with them a vast number of the solens of all the known species. The island of Sicily is famous for a very elegant kind of oyster which is white all over; pinnæ marinæ and porcelains are also found in great plenty there, with tellinæ and chamæ of many species, and a great variety of other beautiful shells. Corsica is famous, beyond all other places, for vast quantities of the pinnæ marinæ: and many other very beautiful shells are found there. (Lister, Hist. Conchyl.) About Syracuse are found the gondola shell, the alated murex, and a great variety of elegant snails, with some of the dolia and neritæ. The Adriatic sea, or gulf of Venice, is less furnished with shells than almost any of the seas thereabout. Muscles and oysters of several species are however found there, and some of the cordiform or heart-shells; there are also some tellinæ. About Ancona there are found vast numbers of the pholades buried in stone; and the aures marinæ are particularly frequent about Puzzoli. (*Bonani, Recreat. Ment. et Ocul*).

9 On the coast of France. The ports of Marseilles, Toulon, and Antibes, are full of pinnæ marinæ, muscles, tellinæ, and chamæ. The coasts of Bretagne afford great numbers of the conchæ anatiferæ and pousepieds; they are found on old rotten boards, on sea substances, and among clusters of sponges. The other ports of France, as Rochelle, Dunkirk, Brest, St Maloes, and others, furnish oysters excellent for the table, but of the common kind, and of no beauty in their shells; great numbers of muscles are also found there; and the common tellinæ, the onion-peel oysters, the solens, and conchæ anatiferæ, are also frequent there. At Granville, in Lower Normandy, there are found very beautiful pectens, and some of the cordiform or heart-shells.

10 Of Britain. Our own English coasts are not the least fruitful in shells, tho' they do not produce such elegantly painted ones as the Indies. About Plymouth are found oysters, muscles, and solens, in great abundance; and there, and on most of our other shores, are numbers of the aures marinæ and dentalia, with pectens, which are excellent food; and many elegant species of the chamæ and tellinæ are fished up in the sea about Scarborough and other places. Ireland affords us great numbers of muscles, and some very elegant scallop shells in great abundance, and the pholades are frequent on most of our shores. We have also great variety of the buccina and cochleæ, some volutæ; and, on the Guernsey coast, a peculiarly beautiful snail, called thence the *Guernsey snail*.

11 Of Spain and Portugal, &c. The coasts of Spain and Portugal afford much the same species of shells with the East Indies, but they are of much fainter colours, and greatly inferior in beauty. There are, according to Tavernier and others, some rivers in Bavaria in which there are found pearls of a fine water. About Cadiz there are found very large pinnæ marinæ, and some fine buccina. The isles of Majorca and Minorca afford a great variety of extremely elegant shells. The pinnæ marinæ are also very numerous there, and their silk is wrought into gloves, stockings, and other things. The Baltic affords a great many beautiful species, but particularly an orange-coloured pecten, or scallop-shell, which is not found in any other part of the world.

12 Fresh water shells. The fresh water shells are found much more frequently, and in much greater plenty than the sea kinds; there is scarce a pond, a ditch, or a river of fresh water in any part of the world in which there are

are not found vast numbers of these shells with the fish living in them. All these shells are small, and they are of very little beauty, being usually of a plain grayish or brownish colour. Our ditches afford us chamæ, buccina, neritæ, and some patellæ; but the Nile, and some other rivers, furnished the ancients with a species of tellina which was large and eatable, and so much superior to the common sea tellina in flavour, that it is commonly known by the name of *tellina regia*, "the royal tellina." We have a small species of buccinum common in our fresh waters, which is very elegant, and always has its operculum in the manner of the larger buccina; a small kind of muscle is also very common, which is so extremely thin and tender, that it can hardly be handled without breaking to pieces. The large fresh water muscle, commonly called in England the *horse muscle*, is too well known to need a description; and the size sufficiently distinguishes it from all other fresh water shells.

In collecting shells, it is most advisable, whenever it can be done, to get those which have in them the living animals; because we shall thus obtain the natural history of the animals, and the shells themselves in their natural beauty, and the full glow of their colours. Shells should be also procured from the deeper parts of their resorts, and immediately after storms on the sea beaches and shores; because, by being much exposed to the sun, their colours fade, and they are liable to other accidents that injure them. In order to kill the fish that inhabits them, Mr Da Costa advises to give them a quick dip in boiling water, and when they are cooled, to lay them in cold water till they are cleaned; and in this operation they should not be touched with aquafortis, or any other acid, nor exposed to the heat of the fire and sun.

13
Art of polishing shells.

The art of polishing shells arrived but lately at its present state of perfection; and as the love of sea shells is become so common among us, it may not be disagreeable to the reader to find some instructions in executing so pleasing a method of adding to their natural beauty, the rules for which are at present so little known, though the effect of them be so much esteemed.

Among the immense variety of shells which we are acquainted with, some are taken up out of the sea, or found on its shores in all their perfection and beauty; their colours being all spread by nature upon the surface, and their natural polish superior to any thing that art could give. Where nature is in herself thus perfect, it were madness to attempt to add any thing to her charms: but in others, where the beauties are latent and covered with a coarser outer skin, art is to be called in; and the outer veil being taken off, all the internal beauties appear.

Among the shells which are found naturally polished are the porcelains, or cowries; the cassanders; the dolia, or conchæ globosæ, or tuns; some buccina, the volutes, and the cylinders, or olives, or, as they are generally though improperly called, the *rhombi*; excepting only two or three, as the tiara, the plumb, and the butter-tub rhombus, where there is an unpromising film on the surface, hiding a very great share of beauty within. Though the generality of the shells of these genera are taken out of the sea in all their beauty, and in their utmost natural polish, there are several other genera, in which all or most of the species are taken up naturally rough and foul, and covered with an epidermis, or coarse outer skin, which is in many rough and downy or hairy. The tellinæ, the muscles, the cochleæ, and many others, are of this kind. The more nice collectors, as naturalists, insist upon having all their shells in their native and genuine appearance, as they are found when living at sea; but the ladies, who make collections, hate the disagreeable outsides, and will have all such polished. It would be very advisable, however, for both kinds of collectors to have the same shells in different specimens both rough and polished: the naturalist would by this means, besides knowing the outside of the shell, be better acquainted with its internal characters than he otherwise could be, and the lady would have a pleasure in comparing the beauties of the shell, in its wrought state, to its coarse appearance as nature gives it. How many elegancies in this part of the creation must be wholly lost to us, if it were not for the assistance of an art of this kind! Many shells in their native state are like rough diamonds; and we can form no just idea of their beauties till they have been polished and wrought into form.

Though the art of polishing shells is a very valuable one, yet it is very dangerous to the shells; for without the utmost care, the means used to polish and beautify a shell often wholly destroy it. When a shell is to be polished, the first thing to be examined is whether it have naturally a smooth surface, or be covered with tubercles or prominences.

A shell which has a smooth surface, and a natural dull polish, need only be rubbed with the hand, or with a piece of chamoy leather, with some tripoli, or fine rotten stone, and will become of a perfectly bright and fine polish. Emery is not to be used on this occasion, because it wears away too much of the shell. This operation requires the hand of an experienced person, that knows how superficial the work must be, and where he is to stop; for in many of these shells the lines are only on the surface, and the wearing away ever so little of the shell defaces them. A shell that is rough, foul, and crusty, or covered with a tartareous coat, must be left a whole day steeping in hot water: when it has imbibed a large quantity of this, it is to be rubbed with rough emery on a stick, or with a blade of a knife, in order to get off the coat. After this, it may be dipped in diluted aquafortis, spirit of salt, or any other acid; and after remaining a few moments in it, be again plunged into common water. This will add greatly to the speed of the work. After this it is to be well rubbed with linen cloths, impregnated with common soap; and when by these several means it is made perfectly clean, the polishing is to be finished with fine emery and a hair-brush. If after this the shell when dry appears not to have so good a polish as was desired, it must be rubbed over with a solution of gum arabic; and this will add greatly to its gloss, without doing it the smallest injury. The gum-water must not be too thick, and then it gives no sensible coat, only heightening the colours. The white of an egg answers this purpose also very well; but it is subject to turn yellow. If the shell has an epidermis, which will by no means admit the polishing of it, it is to be dipped several times in diluted aquafortis, that this may be eaten off; and then the shell is to be polished in the usual way with potty, fine emery, or tripoli, on the hair of a fine brush. When it is only a pellicle that hides the colours, the shells must be steeped in hot water, and after that the skin

Shells. ſkin worked off by degrees with an old file. This is the caſe with ſeveral of the cylinders, which have not the natural poliſh of the reſt.

When a ſhell is covered with a thick and fatty epidermis, as is the caſe with ſeveral of the muſcles and tellinæ; in this caſe aquafortis will do no ſervice, as it will not touch the ſkin: then a rough bruſh and coarſe emery are to be uſed; and if this does not ſucceed, ſeal-ſkin, or, as the workmen call it, *fiſh-ſkin* and *pumice-ſtone*, are to be employed.

When a ſhell has a thick cruſt, which will not give way to any of theſe means, the only way left is to plunge it ſeveral times into ſtrong aquafortis, till the ſtubborn cruſt is wholly eroded. The limpets, auris marina, the helmet-ſhells, and ſeveral other ſpecies of this kind, muſt have this ſort of management; but as the deſign is to ſhow the hidden beauties under the cruſt, and not to deſtroy the natural beauty and poliſh of the inſide of the ſhell, the aquafortis muſt be uſed in this manner: A long piece of wax muſt be provided, and one end of it made perfectly to cover the whole mouth of the ſhell; the other end will then ſerve as a handle, and the mouth being ſtopped by the wax, the liquor cannot get in to the inſide to ſpoil it; then there muſt be placed on a table a veſſel full of aquafortis, and another full of common water.

The ſhell is to be plunged into the aquafortis; and after remaining a few minutes in it, is to be taken out, and plunged into the common water. The progreſs the aquafortis makes in eroding the ſurface is thus to be carefully obſerved every time it is taken out; the point of the ſhell, and any other tender parts, are to be covered with wax, to prevent the aquafortis from eating them away; and if there be any worm holes, they alſo muſt be ſtopped up with wax, otherwiſe the aquafortis would ſoon eat through in thoſe places. When the repeated dippings into the aquafortis ſhow that the coat is ſufficiently eaten away, then the ſhell is to be wrought carefully with fine emery and a bruſh; and when it is poliſhed as high as can be by this means, it muſt be wiped clean, and rubbed over with gum water or the white of an egg. In this ſort of work the operator muſt always have the caution to wear gloves; otherwiſe the leaſt touch of the aquafortis will burn the fingers, and turn them yellow; and often, if it is not regarded, will eat off the ſkin and the nails.

Theſe are the methods to be uſed with ſhells which require but a moderate quantity of the ſurface to be taken off; but there are others which require to have a larger quantity taken off, and to be uncovered deeper: this is called entirely ſcaling a ſhell. This is done by means of a horizontal wheel of lead or tin, impregnated with rough emery; and the ſhell is wrought down in the ſame manner in which ſtones are wrought by the lapidary. Nothing is more difficult, however, than the performing this work with nicety: very often ſhells are cut down too far by it, and wholly ſpoiled; and to avoid this, a coarſe vein muſt be often left ſtanding in ſome place, and taken down afterwards with the file, when the cutting it down at the wheel would have ſpoiled the adjacent parts.

After the ſhell is thus cut down to a proper degree, it is to be poliſhed with fine emery, tripoli, or rotten ſtone, with a wooden wheel turned by the ſame machine as the leaden one, or by the common method of working with the hand with the ſame ingredients. When a ſhell is full of tubercles, or protuberances, which muſt be preſerved, it is then impoſſible to uſe the wheel: and if the common way of dipping into aquafortis be attempted, the tubercles being harder than the reſt of the ſhell, will be eat through before the reſt is ſufficiently ſcaled, and the ſhell will be ſpoiled. In this caſe, induſtry and patience are the only means of effecting a poliſh. A camel's-hair pencil muſt be dipped in aquafortis; and with this the intermediate parts of the ſhell muſt be wetted, leaving the protuberances dry: this is to be often repeated; and after a few moments the ſhell is always to be plunged into water to ſtop the eroſion of the acid, which would otherwiſe eat too deep, and deſtroy the beauty of the ſhell. When this has ſufficiently taken off the foulneſs of the ſhell, it is to be poliſhed with emery of the fineſt kind, or with tripoli, by means of a ſmall ſtick, or the common poliſhing ſtone uſed by the goldſmiths may be uſed.

This is a very tedious and troubleſome thing, eſpecially when the echinated oyſters and murices, and ſome other ſuch ſhells, are to be wrought: and what is worſt of all is, that when all this labour has been employed, the buſineſs is not well done; for there ſtill remain ſeveral places which could not be reached by any inſtrument, ſo that the ſhell muſt neceſſarily be rubbed over with gum water or the white of an egg afterwards, in order to bring out the colours and give a gloſs; in ſome caſes it is even neceſſary to give a coat of varniſh. 14

Some ſhells are ſo much diſguiſed by poliſhing as not to be known; ſuch as

Theſe are the means uſed by artiſts to brighten the colours and add to the beauty of ſhells; and the changes produced by poliſhing in this manner are ſo great, that the ſhell can ſcarcely be known afterwards to be the ſame it was; and hence we hear of new ſhells in the cabinets of collectors, which have no real exiſtence as ſeparate ſpecies, but are ſhells well known, diſguiſed by poliſhing. To caution the reader againſt errors of this kind, it may be proper to add the moſt remarkable ſpecies thus uſually altered. 15

the onyx-ſhell,

The onyx-ſhell or volute, called by us the *purple* or *violet-tip*, which in its natural ſtate is of a ſimple pale brown, when it is wrought ſlightly, or poliſhed with juſt the ſuperficies taken off, is of a fine bright yellow; and when it is eaten away deeper, it appears of a fine milk white, with the lower part bluiſh: it is in this ſtate that it is called the *onyx-ſhell;* and it is preſerved in many cabinets in its rough ſtate, and in its yellow appearance, as different ſpecies of ſhells. 16

violet ſhells,

The *violet ſhell*, ſo common among the curious, is a ſpecies of porcelain, or common cowry, which does not appear in that elegance till it has been poliſhed; and the common auris marina ſhows itſelf in two or three different forms, as it is more or leſs deeply wrought. In its rough ſtate it is duſky and coarſe, of a pale brown on the outſide, and pearly within; when it is eaten down a little way below the ſurface, it ſhows variegations of black and green; and when ſtill farther eroded, it appears of a fine pearly hue within and without. 17

nautilus.

The *nautilus*, when it is poliſhed down, appears all over of a fine pearly colour; but when it is eaten away but to a ſmall depth, it appears of a fine yellowiſh colour with duſky hairs. The burgau, when entirely cleared of its coat, is of the moſt beautiful pearl co-

Shells. lour; but when but ſlightly eroded, it appears of a variegated mixture of green and red; whence it has been called the *parroquet ſhell*. The common helmet ſhell, when wrought, is of the colour of the fineſt agate; and the muſcles, in general, though very plain ſhells in their common appearance, become very beautiful when poliſhed, and ſhow large veins of the moſt elegant colours. The Perſian ſhell, in its natural ſtate, is all over white, and covered with tubercles; but when it has been ground down on a wheel, and poliſhed, it appears of a gray colour, with ſpots and veins of a very bright and highly poliſhed white. The limpets, in general, become very different, when poliſhed, moſt of them ſhowing very elegant colours; among theſe the tortoiſe-ſhell limpet is the principal; it does not appear at all of that colour or tranſparence till it has been wrought.

18 Junquil-chama.

That elegant ſpecies of ſhell called the *junquil-chama*, which has deceived ſo many judges of theſe things into an opinion of its being a new ſpecies, is only a white chama with a reticulated ſurface; but when this is poliſhed, it loſes at once its reticular work and its colour, and becomes perfectly ſmooth, and of a fine bright yellow. The violet-coloured chama of New England, when worked down and poliſhed, is of a fine milk white, with a great number of blue veins, diſpoſed like the variegations in agates.

19 The aſſes-ear ſhell.

The *aſſes-ear ſhell*, when poliſhed after working it down with the file, becomes extremely gloſſy, and obtains a fine roſe colour all about the mouth. Theſe are ſome of the moſt frequent among an endleſs variety of changes wrought on ſhells by poliſhing: and we find there are many of the very greateſt beauties of this part of the creation which muſt have been loſt but for this method of ſearching deep in the ſubſtance of the ſhell for them.

20 Dutch method of poliſhing ſhells.

The Dutch are very fond of ſhells, and are very nice in their manner of working them: they are under no reſtraint, however, in their works; but uſe the moſt violent methods, ſo as often to deſtroy all the beauty of the ſhell. They file them down on all ſides, and often take them to the wheel, when it muſt deſtroy the very characters of the ſpecies. Nor do they ſtop at this: but, determined to have beauty at any rate, they are for improving upon nature, and frequently add ſome lines and colours with a pencil, afterwards covering them with a fine coat of varniſh, ſo that they ſeem the natural lineations of the ſhell: the Dutch cabinets are by theſe means made very beautiful, but they are by no means to be regarded as inſtructors in natural hiſtory. There are ſome artificers of this nation who have a way of covering ſhells all over with a different tinge from that which nature gives them; and the curious are often enticed by theſe tricks to purchaſe them for new ſpecies.

There is another kind of work beſtowed on certain ſpecies of ſhells, particularly the nautilus; namely, the engraving on it lines and circles, and figures of ſtars, and other things. This is too obvious a work of art to ſuffer any one to ſuppoſe it natural. Buonani has figured ſeveral of theſe wrought ſhells at the end of his work; but this was applying his labour to very little purpoſe; the ſhells are ſpoiled as objects of natural hiſtory by it, and the engraving is ſeldom worth any thing.—They are principally done in the Eaſt Indies.

Shells are ſubject to ſeveral imperfections; ſome of which are natural and others accidental. The natural defects are the effect of age, or ſickneſs in the fiſh. The greateſt miſchief happens to ſhells by the fiſh dying in them. The curious in theſe things pretend to be always able to diſtinguiſh a ſhell taken up with the fiſh alive from one found on the ſhores: they call the firſt a *living*, the ſecond a *dead* ſhell; and ſay that the colours are always much fainter in the dead ſhells. When the ſhells have lain long dead on the ſhores, they are ſubject to many injuries, of which the being eaten by ſea worms is not the leaſt: age renders the fineſt ſhells livid or dead in their colours. 21 Imperfections of ſhells natural and accidental.

Beſides the imperfections ariſing from age and ſickneſs in the fiſh, ſhells are ſubject to other deformities, ſuch as morbid cavities, or protuberances, in parts where there ſhould be none. When the ſhell is valuable, theſe faults may be hid, and much added to the beauty of the ſpecimen, without at all injuring it as an object of natural hiſtory, which ſhould always be the great end of collecting theſe things. The cavities may be filled up with maſtic diſſolved in ſpirit of wine, or with iſinglaſs: theſe ſubſtances muſt be either coloured to the tinge of the ſhell, or elſe a pencil dipped in water colours muſt finiſh them up to the reſemblance of the reſt; and then the whole ſhell being rubbed over with gum water, or with the white of an egg, ſcarce any eye can perceive the artifice: the ſame ſubſtances may alſo be uſed to repair the battered edge of a ſhell, provided the pieces chipped off be not too large. And when the excreſcences of a ſhell are faulty, they are to be taken down with a fine file. If the lip of a ſhell be ſo battered that it will not admit of repairing by any cement, the whole muſt be filed down or ground on the wheel till it become even.

Foſſil Shells. Thoſe found buried at great depths in the earth.

Of theſe ſome are found remaining almoſt entirely in their native ſtate, but others are variouſly altered by being impregnated with particles of ſtone and of other foſſils; in the place of others there is found mere ſtone or ſpar, or ſome other native mineral body, expreſſing all the lineaments in the moſt exact manner, as having been formed wholly from them, the ſhell having been firſt depoſited in ſome ſolid matrix, and thence diſſolved by very ſlow degrees, and this matter left in its place, on the cavities of ſtone and other ſolid ſubſtances, out of which ſhells had been diſſolved and waſhed away, being afterwards filled up leſs ſlowly with theſe different ſubſtances, whether ſpar or whatever elſe: theſe ſubſtances, ſo filling the cavities, can neceſſarily be of no other form than that of the ſhell, to the abſence of which the cavity was owing, though all the nicer lineaments may not be ſo exactly expreſſed. Beſides theſe, we have alſo in many places maſſes of ſtone formed within various ſhells; and theſe having been received into the cavities of the ſhells while they were perfectly fluid, and having therefore nicely filled all their cavities, muſt retain the perfect figures of the internal part of the ſhell, when the ſhell itſelf ſhould be worn away or periſhed from their outſide. The various ſpecies we find of theſe are, in many genera, as numerous as the known recent ones; and as we have in our own iſland not only the ſhells of our own ſhores, but thoſe of many other very diſtant ones, ſo we have alſo

also many species, and those in great numbers, which are in their recent state, the inhabitants of other yet unknown or unsearched seas and shores. The cockles, muscles, oysters, and the other common bivalves of our own seas, are very abundant: but we have also an amazing number of the nautilus kind, particolarly of the nautilus græcorum, which though a shell not found living in our own or any neighbouring seas, yet is found buried in all our clay-pits abuut Loodon and elsewhere; and the most frequent of all fussil shells in some of our coontries are the conchæ anomiæ, which yet we know not of in any part of the world in their recent state. Of this surt alsn are the cornua ammonis and the gryphitæ, with several of the echinitæ and others.

The exact similitude of the known shells, recent and fossil, in their several kinds, will by uo means suffer us to believe that these, though not yet knowu tu us in their living state, are, as some have idly thnught, a sort of *lusus naturæ*. It is certain, that of the many known shures, very few, not even those of our own islaod, have been yet carefully searched for the shell-fish that inhabit them; and as we see in the nautilus græcorum an instance of shells heing brought from very distant parts of the wnrld to be buried here, we cannot wonder that yet unknown shores, or the unknown bottoma of deep seas, should have furnished us with many unknown shell-fish, which may have been brought with the rest; whether that were at the time of the general deluge, or the effect of any other catastrophe of a like kind, or hy whatever other means, to be left in the yet unhardened matter of our stony and clayey strata.

Shells, in gunnery, are hollow iron balls to throw out of mortars or howitzers, with a fuse-hole of about an inch diameter, to load them with powder, and to receive the fuse. The bottom, or part opposite to the fuse, is made thicker than the rest, that the fuse may fall uppermost. But in small elevations this does not always happen, nor indeed is it necessary; for, let the shell fall as it will, the fuse sets fire to the powder within, which bursts the shell, and causes great devastation. The shells had much better be of an equal thicknesa; for then they burst into more pieces.

Message Shells, are nothing more than howitz-shells, in the inside of which a letter or other papers are put; the fuse hule is stopped up with wood or cork, and the shells are fired out of a royal or howitz, either into a garrison or camp. It is soppofed, that the person to whom the letter is sent knows the time, and accordingly appoints a guard to look out for its arrival.

Shell-Fish. These animals are io general oviparous, very few instances having been foond of such as are viviparous. Among the oviparous kinds, anatomists have found that some species are of different sexes, in the different individoals of the same species; but others are hermaphrodites, every one being in itself bnth male and female. In both cases their increase is very numerous, and scarce inferior to that of plants, or of the most fruitful of the insect class. The eggs are very small, and are hung together in a sort of clusters by means of a glotioous humour, which is always placed about them, and is of the nature of the gelly of frog's spawn. By means of this, they are not only kept together in the parcel, but the whole cluster is fastened to the rocks, shells, or other solid substances; and thus they are preserved from being driven on shore by the waves, and left where they cannot succeed. See Testacea.

Shell-Gold. See Gold.

SHELTIE, a small hut strong kind of horse, so called from Shetland, or Zetland, where they are produced.

SHELVES, in sea language, a general name given to any dangeruus shallows, sand banks, or rocka, lying immediately under the surface of the water, so as to intercept any ship in her passage, and endanger her destruction.

SHENAN. See *Dying of Leather*, Vol. IX. p. 75c, foot note.

SHENSTONE (William), an admired English poet, the eldest son of a plain country geutleman, who farmed his own estate in Shropshire, was born in November 1714. He learned to read uf an old dame, whom his poem of the "School-mistress" has delivered to posterity; and soon received such delight from books, that he was always calling for new entertainment, and expected that, when any of the family went to market, a new book should be brought him, which, when it came, was in fondness carried to bed, and laid by him. It is said, that when his request had been neglected, his mnther wrapped up a piece uf wood of the same form, and pacified him fur the night. As he grew older, he went fur a while to the grammar school in Hales Owen, and was placed afterwards with Mr Crumpton, an eminent schoolmaster at Solihul, where he distinguished himself by the quickness of his progress. When he was young (June 1724), he was deprived uf his father; and soon after (August 1726) of his grandfather; and was, with his brother, who died afterwards unmarried, left to the care of his grandmother, who managed the estate. From school he was sent, in 1732, to Pembroke college in Oxford, a society which for half a century has been eminent for English poetry and elegant literature. Here it appeats that he found delight and advantage; for he continoed his name there ten years, though he took no degree. After the first foor years he put on the civilian's gown, but without showing any intention to engage in the profession. About the time when he went to Oxford, the death of his grandmother devolved his affairs to the care of the reverend Mr Dolman, of Brome, in Staffordshire, whose attention he always mentioned with gratitude.—At Oxford he applied to English poetry; and, in 1737, published a small Miscellany, without his name. He then for a time wandered aboot, to acquaint himself with life, and was sometimes at London, sometimes at Bath, or any place of public resort; but he did not forget his poetry. He poblished, in 1740, his "Jodgment of Hercoles," addressed to Mr Lyttleton, whose interest he supported with great warmth at an election; this was two years afterwards followed by the "School-mistress." Mr Dolman, to whose care he was indebted for his ease and leisure, died in 1745, and the care of his fortone now fell upoo himself. He tried to escape it a while, and lived at his hoose with his tenants, who were distantly related; but, finding that imperfect possession ioconvenient, he took the whole estate into his own hands, an event which rather improved its beanty than increased its produce. Now began his delight in rural pleasures, and his pession of rural elegance; but in time his expences occasioned

occasioned clamours that overpowered the lamb's bleat and the linnet's song, and his groves were haunted by beings very different from fawns and fairies. He spent his estate in adorning it, and his death was probably hastened by his anxieties. He was a lamp that spent its oil in blazing. It is said, that if he had lived a little longer, he would have been assisted by a pension; such bounty could not have been more properly bestowed, but that it was ever asked is not certain; it is too certain that it was never enjoyed.—He died at the Leasowes, of a putrid fever, about five on Friday morning, Feb. 11. 1763; and was buried by the side of his brother, in the churchyard of Hales-Owen.

In his private opinions, our author adhered to no particular sect, and hated all religious disputes. Tenderness, in every sense of the word, was his peculiar characteristic; and his friends, domestics, and poor neighbours, daily experienced the effects of his benevolence. This virtue he carried to an excess that seemed to border upon weakness; yet if any of his friends treated him ungenerously, he was not easily reconciled. On such occasions, however, he used to say, "I never will be a revengeful enemy: but I cannot, it is not in my nature, to be half a friend." He was no economist; for the generosity of his temper prevented his paying a proper regard to the use of money: he exceeded therefore the bounds of his paternal fortune. But, if we consider the perfect paradise into which he had converted his estate, the hospitality with which he lived, his charities to the indigent, and all out of an estate that did not exceed 300l. a-year, one should rather wonder that he left any thing behind him, than blame his want of economy: he yet left more than sufficient to pay all his debts, and by his will appropriated his whole estate to that purpose. Though he had a high opinion of many of the fair sex, he forbore to marry. A passion he entertained in his youth was with difficulty surmounted. The lady was the subject of that admirable pastoral, in four parts, which has been so universally and so justly admired, and which, one would have thought, must have softened the proudest and most obdurate heart. His works have been published by Mr Dodsley, in 3 vols. 8vo. The first volume contains his poetical works, which are particularly distinguished by an amiable elegance and beautiful simplicity; the second volume contains his prose works; the third his letters, &c. *Biographical Dictionary.*

SHEPPEY, an island at the mouth of the river Medway, about 20 miles in circumference. It is separated from the main land by a narrow channel, and has a fertile soil, which feeds great flocks of sheep. The borough-town of Queenborough is seated thereon; besides which it has several villages.

SHERARDIA, in botany: A genus of the monogynia order, belonging to the tetraodria class of plants; and in the natural method ranking under the 47th order, *Stellatæ*. The calyx is small, quadridentate; the corolla monopetalous, long, and funnel-shaped. The two seeds are naked, and crowned with the calyx. There are three species, viz. 1. Arvensis; 2. Muralis; 3. Fruticosa.

SHERBET, or SHERBIT, a compound drink, first brought into England from Turkey and Persia, consisting of water, lemon-juice, and sugar, in which are dissolved perfumed cakes made of excellent Damascus fruit, containing an infusion of some drops of rose water. Another kind of it is made of violets, honey, juice of raisins, &c.

SHERIDAN (Thomas), D.D. the intimate friend of Dean Swift, is said by Shield, in Cibber's "Lives of the Poets," to have been born about 1684, in the county of Cavan, where, according to the same authority, his parents lived in no very elevated state. They are described as being unable to afford their son the advantages of a liberal education; but he, being observed to give early indications of genius, attracted the notice of a friend to his family, who sent him to the college of Dublin, and contributed towards his support while he remained there. He afterwards entered into orders, and set up a school in Dublin, which long maintained a very high degree of reputation, as well for the attention bestowed on the morals of the scholars as for their proficiency in literature. So great was the estimation in which this seminary was held, that it is asserted to have produced in some years the sum of 1000l. It does not appear that he had any considerable preferment; but his intimacy with Swift, in 1725, procured for him a living in the south of Ireland worth about 150l. a-year, which he went to take possession of, and, by an act of inadvertence, destroyed all his future expectations of rising in the church; for being at Corke on the 1st of August, the anniversary of King George's birth-day, he preached a sermon, which had for its text, "Sufficient for the day is the evil thereof." On this being known, he was struck out of the list of chaplains to the lord lieutenant, and forbidden the castle.

This living Dr Sheridan afterwards changed for that of Dunboyne, which, by the knavery of the farmers, and power of the gentlemen in the neighbourhood, fell so low as 80l. *per annum.* He gave it up for the free school of Cavan, where he might have lived well in so cheap a country on 80l. a-year salary, besides his scholars; but the air being, as he said, too moist and unwholesome, and being disgusted with some persons who lived there, he sold the school for about 400l.; and having soon spent the money, he fell into bad health, and died Sept. 10. 1738, in his 55th year.

Lord Corke has given the following character of him: "Dr Sheridan was a school-master, and in many instances perfectly well adapted for that station. He was deeply versed in the Greek and Roman languages, and in their customs and antiquities. He had that kind of good nature which absence of mind, indolence of body, and carelessness of fortune, produce; and although not over strict in his own conduct, yet he took care of the morality of his scholars, whom he sent to the university remarkably well founded in all kinds of classical learning, and not ill instructed in the social duties of life. He was slovenly, indigent, and cheerful. He knew books much better than men; and he knew the value of money least of all. In this situation, and with this disposition, Swift fastened upon him as upon a prey with which he intended to regale himself whenever his appetite should prompt him." His Lordship then mentions the event of the unlucky sermon, and adds; "This ill-starred, good-natured, improvident man, returned to Dublin, unhinged from all favour at court, and even banished from the castle. But still he remained a punster, a quibbler, a fiddler, and a wit. Not a day

Sheridan, Sheriff.

day passed without a rebus, an anagram, or a madrigal. His pen and his fiddlestick were in continual motion; and yet to little or no purpose, if we may give credit to the following verses, which shall serve as the conclusion of his poetical character.

"With music and poetry equally bless'd,
"A bard thus Apollo most humbly address'd;
"Great author of poetry, music, and light!
"Instructed by thee, I both fiddle and write;
"Yet unheeded I scrape, or I scribble all day,
"My tunes are neglected, my verse flung away.
"Thy substitute here, Vice-Apollo disdains
"To vouch for my numbers, or list to my strains.
"Thy manual sign he refuses to put
"To the airs I produce from the pen or the gut:
"Be thou then propitious, great Phœbus, and grant
"Relief, or reward, to my merit or want.
"Tho' the Dean and Delany transcendently shine,
"O! brighten one solo or sonnet of mine:
"Make one work immortal, 'tis all I request.
"Apollo look'd pleas'd, and resolving to jest,
"Replied—Honest friend, I've consider'd your case,
"Nor dislike your unmeaning and innocent face.
"Your petition I grant, the boon is not great,
"Your works shall continue, and here's the receipt,
"On rondeaus hereafter your fiddle-strings spend,
"Write verses in circles, they never shall end."

"One of the volumes of Swift's miscellanies consists almost entirely of letters between him and the Dean. He published a prose translation of Persius; to which he added the best notes of former editors, together with many judicious ones of his own. This work was printed at London, 1739, in 12mo." *Biographical Dictionary.*

SHERIDAN (Mrs Frances), wife to Thomas Sheridan, M. A. was born in Ireland about the year 1724, but descended from a good English family which had removed thither. Her maiden name was Chamberlaine, and she was grand-daughter of Sir Oliver Chamberlaine. The first literary performance by which she distinguished herself was a little pamphlet at the time of a violent party-dispute relative to the theatre, in which Mr Sheridan had newly embarked his fortune. So well-timed a work exciting the attention of Mr Sheridan, he by an accident discovered his fair patroness, to whom he was soon afterwards married. She was a person of the most amiable character in every relation of life, with the most engaging manners. After lingering some years in a very weak state of health, she died at Blois, in the south of France, in the year 1767. Her "Sydney Biddulph" may be ranked with the first productions of that class in ours or in any other language. She also wrote a little romance in one volume called *Nourjahad*, in which there is a great deal of imagination productive of an admirable moral. And she was the authoress of two comedies, "The Discovery" and "The Dupe."

Blackstone's Commentaries, Vol. I. 339.

SHERIFF, an officer, in each county in England, nominated by the king, invested with a judicial and ministerial power, and who takes place of every nobleman in the county during the time of his office.

The sheriff is an office of very great antiquity in this kingdom, his name being derived from two Saxon words, signifying the *reeve*, *bailiff*, or *officer* of the shire. He is called in Latin *vice-comes*, as being the deputy of the earl or *comes*, to whom the custody of the shire is said to have been committed at the first division of this kingdom into counties. But the earls, in process of time, by reason of their high employments and attendance on the king's person, not being able to transact the business of the county, were delivered of that burden; reserving to themselves the honour, but the labour was laid on the sheriff. So that now the sheriff does all the king's business in the county; and tho' he be still called *vice-comes*, yet he is entirely independent of, and not subject to, the earl; the king by his letters patent, committing *custodiam comitatus* to the sheriff, and to him alone.

Sheriffs were formerly chosen by the inhabitants of the several counties. In confirmation of which it was ordained, by statute 28 Edw. I. c. 8. that the people should have an election of sheriffs in every shire where the shrievalty is not of inheritance. For anciently in some counties the sheriffs were hereditary; as we apprehend they were in Scotland till the statute 20 Geo. II. c. 43; and still continue in the county of Westmorland to this day; the city of London having also the inheritance of the shrievalty of Middlesex vested in their body by charter. The reason of these popular elections is assigned in the same statute, c. 13. "that the commons might choose such as would not be a burden to them." And herein appears plainly a strong trace of the democratical part of our constitution; in which form of government it is an indispensable requisite, that the people should choose their own magistrates. This election was in all probability not absolutely vested in the commons, but required the royal approbation. For in the Gothic constitution, the judges of their county-courts (which office is executed by the sheriff) were elected by the people, but confirmed by the king: and the form of their election was thus managed; the people, or *incolæ territorii*, chose twelve electors, and they nominated three persons, *ex quibus rex unam confirmabat*. But with us in England, these popular elections, growing tumultuous, were put an end to by the statute 9 Edw. II. st. 2. which enacted, that the sheriffs should from thenceforth be assigned by the chancellor, treasurer, and the judges; as being persons in whom the same trust might with confidence be reposed. By statutes 14 Edw. III. c. 7. 23 Hen. VI. c. 8. and 21 Hen. VIII. c. 20. the chancellor, treasurer, president of the king's council, chief justices, and chief baron, are to make this election; and that on the morrow of All Souls, in the exchequer. And the king's letters patent, appointing the new sheriffs, used commonly to bear date the sixth day of November. The statute of Cambridge, 12 Ric. II. c. 2. ordains, that the chancellor, treasurer, keeper of the privy seal, steward of the king's house, the king's chamberlain, clerk of the rolls, the justices of the one bench and the other, barons of the exchequer, and all other that shall be called to ordain, name, or make justices of the peace, sheriffs, and other officers of the king, shall be sworn to act indifferently, and to name no man that sueth to be put in office, but such only as they shall judge to be the best and most sufficient. And the custom now is (and has been at least ever since the time of Fortescue, who was chief justice and chancellor to Henry the Sixth), that all the judges, together with the other great officers, meet in the exchequer chamber on the morrow of All Souls yearly, (which day is now altered to the morrow

of

of St Martin by the last act for abbreviating Michaelmas term), and then and there propose three persons to the king, who afterwards appoints one of them to be sheriff. This custom of the twelve judges proposing three persons seems borrowed from the Gothic constitution before-mentioned: with this difference, that among the Goths the 12 nominors were first elected by the people themselves. And this usage of ours, at its first introduction, there is reason to believe, was founded upon some statute, though not now to be found among our printed laws; first, because it is materially different from the direction of all the statutes before mentioned; which it is hard to conceive that the judges would have countenanced by their concurrence, or that Fortescue would have inserted in his book, unless by the authority of some statute; and also, because a statute is expresly referred to in the record, which Sir Edward Coke tells us he transcribed from the council-book of 3d March, 34 Hen. VI. and which is in substance as follows: The king had of his own authority appointed a man sheriff of Lincolnshire, which office he refused to take upon him; whereupon the opinions of the judges were taken, what should be done in this behalf. And the two chief justices, Sir John Fortescue and Sir John Prisot, delivered the unanimous opinion of them all: "that the king did an error when he made a person sheriff that was not chosen and presented to him according to the statute; that the person refusing was liable to no fine for disobedience, as if he had been one of the three persons chosen according to the tenor of the statute; that they would advise the king to have recourse to the three persons that were chosen according to the statute, or that some other thrifty man be entreated to occupy the office for this year; and that, the next year, to eschew such inconveniences, the order of the statute in this behalf made be observed." But, notwithstanding this unanimous resolution of all the judges of England, thus entered in the council-book, and the statute 34 and 35 Hen. VIII. c. 26. § 61. which expresly recognizes this to be the law of the land, some of our writers have affirmed, that the king, by his prerogative, may name whom he pleases to be sheriff, whether chosen by the judges or not. This is grounded on a very particular case in the fifth year of Queen Elizabeth, when, by reason of the plague, there was no Michaelmas term kept at Westminster; so that the judges could not meet there *in crastino animarum* to nominate the sheriffs: whereupon the queen named them herself, without such previous assembly, appointing for the most part one of two remaining in the last year's list. And this case, thus circumstanced, is the only authority in our books for the making these extraordinary sheriffs. It is true, the reporter adds, that it was held that the queen by her prerogative might make a sheriff without the election of the judges, *non obstante aliquo statuto in contrarium*; but the doctrine of *non obstante*, which sets the prerogative above the laws, was effectually demolished by the bill of rights at the Revolution, and abdicated Westminster-hall when King James abdicated the kingdom. However, it must be acknowledged, that the practice of occasionally naming what are called *pocket sheriffs*, by the sole authority of the crown, hath uniformly continued to the reign of his present majesty; in which, it is believed, few (if any) instances have occurred.

Sheriffs, by virtue of several old statutes, are to continue in their office no longer than one year; and yet it hath been said that a sheriff may be appointed *durante bene placito*, or during the king's pleasure; and so is the form of the royal writ. Therefore, till a new sheriff be named, his office cannot be determined, unless by his own death, or the demise of the king; in which last case it was usual for the successor to send a new writ to the old sheriff; but now, by statute 1 Anne st. 1. c. 8. all officers appointed by the preceding king may hold their offices for six months after the king's demise, unless sooner displaced by the successor. We may farther observe, that by statute 1 Rich. II. c. 11. no man that has served the office of sheriff for one year can be compelled to serve the same again within three years after.

We shall find it is of the utmost importance to have the sheriff appointed according to law, when we consider his power and duty. These are either as a judge, as the keeper of the king's peace, as a ministerial officer of the superior courts of justice, or as the king's bailiff.

In his judicial capacity he is to bear and determine all causes of 40 shillings value and under, in his county-court: and he has also a judicial power in divers other civil cases. He is likewise to decide the elections of knights of the shire, (subject to the controul of the House of Commons), of coroners, and of verderors; to judge of the qualification of voters, and to return such as he shall determine to be duly elected.

As the keepers of the king's peace, both by common law and special commission, he is the first man in the county, and superior in rank to any nobleman therein, during his office. He may apprehend, and commit to prison, all persons who break the peace, or attempt to break it; and may bind any one in a recognizance to keep the king's peace. He may, and is bound, *ex officio*, to pursue and take all traitors, murderers, felons, and other misdoers, and commit them to gaol for safe custody. He is also to defend his county against any of the king's enemies when they come into the land; and for this purpose, as well as for keeping the peace and pursuing felons, he may command all the people of his county to attend him; which is called the *posse comitatus*, or power of the county; which summons, every person above 15 years old, and under the degree of a peer, is bound to attend upon warning, under pain of fine and imprisonment. But though the sheriff is thus the principal conservator of the peace in his county, yet, by the express directions of the great charter, he, together with the constable, coroner, and certain other officers of the king, are forbidden to hold any pleas of the crown, or, in other words, to try any criminal offence. For it would be highly unbecoming, that the executioners of justice should be also the judges; should impose, as well as levy, fines and amercements; should one day condemn a man to death, and personally execute him the next. Neither may he act as an ordinary justice of the peace during the time of his office; for this would be equally inconsistent, he being in many respects the servant of the justices.

In his ministerial capacity, the sheriff is bound to execute all process issuing from the king's courts of justice. In the commencement of civil causes, he is to serve the writ, to arrest, and to take bail; when the cause comes to trial, he must summon and return the jury; when it is determined, he must see the judgment of

Sheriff, Sherlock.

of the court carried into execution. In criminal matters, he also arrests and imprisons, he returns the jury, he has the custody of the delinquent, and he executes the sentence of the court, tho' it extend to death itself.

As the king's bailiff, it is his business to preserve the rights of the king within his bailiwick; for so his county is frequently called in the writs: a word introduced by the princes of the Norman line; in imitation of the French, whose territory is divided into bailiwicks, as that of England into counties. He must seize to the king's use all lands devolved to the crown by attainder or escheat; must levy all fines and forfeitures, must seize and keep all waifs, wrecks, estrays, and the like, unless they be granted to some subject; and must also collect the king's rents within his bailiwick, if commanded by process from the exchequer.

To execute these various offices, the sheriff has under him many inferior officers; an under sheriff, bailiffs, and gaolers, who must neither buy, sell, nor farm their offices, on forfeiture of 500l.

The under sheriff usually performs all the duties of the office; a very few only excepted, where the personal presence of the high sheriff is necessary. But no under sheriff shall abide in his office above one year; and if he does, by statute 23 Hen. VI. c. 8. he forfeits 200l. a very large penalty in those early days. And no under sheriff or sheriff's officer shall practise as an attorney during the time he continues in such office: for this would be a great inlet to partiality and oppression. But these salutary regulations are shamefully evaded, by practising in the names of other attorneys, and putting in sham deputies by way of nominal under sheriffs: by reason of which, says Dalton, the under sheriffs and bailiffs do grow so cunning in their several places, that they are able to deceive, and it may well be feared that many of them do deceive, both the king, the high sheriff, and the county.

Sheriff, in Scotland. See Law, Part III. sect. 3.

SHERLOCK (William), a learned English divine in the 17th century, was born in 1641, and educated at Eaton school, where he distinguished himself by the vigour of his genius and his application to study. Thence he was removed to Cambridge, where he took his degrees. In 1669 he became rector of the parish of St George, Botolph lane, in London; and in 1681 was collated to the prebend of Pancras, in the cathedral of St Paul's. He was likewise chosen master of the Temple, and had the rectory of Therfield in Hertfordshire. After the Revolution he was suspended from his preferment, for refusing the oaths to King William and Queen Mary; but at last he took them, and publicly justified what he had done. In 1691 he was installed dean of St Paul's. His Vindication of the Doctrine of the Trinity engaged him in a warm controversy with Dr South and others. Bishop Burnet tells us, he was "a clear, a polite, and a strong writer; but apt to assume too much to himself, and to treat his adversaries with contempt." He died in 1707. His works are very numerous; among these are, 1. A Discourse concerning the Knowledge of Jesus Christ, against Dr Owen. 2. Several pieces against the Papists, the Socinians, and Dissenters. 3. A practical Treatise on Death, which is much admired. 4. A practical Discourse on Providence. 5. A practical Discourse on future Judgment; and many other works.

Sherlock, Sherriffe.

Sherlock (Dr Thomas), bishop of London, was the son of the preceding Dr William Sherlock, and was born in 1678. He was educated in Catharine hall, Cambridge, where he took his degrees, and of which he became master: he was made master of the Temple very young, on the resignation of his father; and it is remarkable, that this mastership was held by father and son successively for more than 70 years. He was at the head of the opposition against Dr Hoadley bishop of Bangor; during which contest he published a great number of pieces. He attacked the famous Collins's "Grounds and Reasons of the Christian Religion," in a course of six sermons, preached at the Temple church, which he entitled "The Use and Intent of Prophecy in the several Ages of the World." In 1728, Dr Sherlock was promoted to the bishopric of Bangor; and was translated to Salisbury in 1734. In 1747 he refused the archbishopric of Canterbury, on account of his ill state of health; but recovering in a good degree, accepted the see of London the following year. On occasion of the earthquakes in 1750, he published an excellent Pastoral Letter to the clergy and inhabitants of London and Westminster: of which it is said there were printed in 4to, 5000; in 8vo, 20,000; and in 12mo, about 30,000; beside pirated editions, of which not less than 50,000 were supposed to have been sold. Under the weak state of body in which he lay for several years, he revised and published 4 vols. of Sermons in 8vo, which are particularly admired for their ingenuity and elegance. He died in 1762, and by report worth 150,000l. "His learning," says Dr Nicholls, "was very extensive: God had given him a great and an understanding mind, a quick comprehension, and a solid judgment. These advantages of nature he improved by much industry and application. His skill in the civil and canon law was very considerable; to which he had added such a knowledge of the common law of England as few clergymen attain to. This it was that gave him that influence in all causes where the church was concerned; as knowing precisely what it had to claim from its constitutions and canons, and what from the common law of the land." Dr Nicholls then mentions his constant and exemplary piety, his warm and fervent zeal in preaching the duties and maintaining the doctrines of Christianity, and his large and diffusive munificence and charity; particularly by his having given large sums of money to the corporation of clergymen's sons, to several of the hospitals, and to the society for propagating the gospel in foreign parts: also his bequeathing to Catharine hall in Cambridge, the place of his education, his valuable library of books, and his donations for the founding a librarian's place and a scholarship, to the amount of several thousand pounds.

SHERRIFFE of Mecca, the title of the descendants of Mahomet by Hassan Ibn Ali. These are divided into several branches, of which the family of Ali Bunemi, consisting at least of three hundred individuals enjoy the sole right to the throne of Mecca. The Ali Bunemi are, again, subdivided into two subordinate branches, Darii Sajid, and Darii Barkad; of whom sometimes the one, sometimes the other, have given sovereigns to Mecca and Medina, when these were separate states.

Not only is the Turkish sultan indifferent about the order of succession in this family, but he seems even to foment

foment the dissensions which arise among them, and favours the strongest, merely that he may weaken them all. As the order of succession is not determinately fixed, and the sherriffes may all aspire alike to the sovereign power, this uncertainty of right, aided by the intrigues of the Turkish officers, occasions frequent revolutions. The grand sherriffe is seldom able to maintain himself on the throne; and it still seldomer happens that his reign is not disturhed by the revolt of his nearest relations. There have been instances of a nephew succeeding his uncle, an uncle succeeding his nephew; and sometimes of a person, from a remote branch, coming in the room of the reigning prince of the ancient house.

When Niebuhr was in Arabia, in 1763, the reigning Sherriffe Mesad had sat fourteen years on the throne, and, during all that period, had been continually at war with the neighbouring Arabs, and with his own nearest relations sometimes. A few years before, the pacha of Syria had deposed him, and raised his younger brother to the sovereign dignity in his stead. But after the departure of the caravan, Jafar, the new sherriffe, not being able to maintain himself on the throne, was obliged to resign the sovereignty again to Mesad. Achmet, the second brother of the sherriffe, who was much beloved by the Arabs, threatened to attack Mecca while Niebuhr was at Jidda. Our traveller was soon after informed of the termination of the quarrel, and of Achmet's return to Mecca, where he continued to live peaceably in a private character.

These examples show that the Mussulmans observe not the law which forbids them to bear arms against their holy places. An Egyptian bey even presumed, a few years since, to plant some small cannons within the compass of the Kaba, upon a small tower, from which he fired over that sacred mansion, upon the palace of Sherriffe Mesad, with whom he was at variance.

The dominions of the sherriffe comprehend the cities of Mecca, Medina, Jambo, Taaif, Sadie, Ghunfude, Hali, and thirteen others less considerable, all situated in Hedjas. Near Taif is the lofty mountain of Gazvan, which, according to Arabian authors, is covered with snow in the midst of summer. As these dominions are neither opulent nor extensive, the revenue of their sovereign cannot be considerable.

He finds a rich resource, however, in the imposts levied on pilgrims, and in the gratuities offered him by Mussulman monarchs. Every pilgrim pays a tax of from ten to a hundred crowns, in proportion to his ability. The Great Mogul remits annually sixty thousand roupees to the sherriffe, by an assignment upon the government of Surat. Indeed, since the English made themselves masters of this city, and the territory belonging to it, the nabob of Surat has no longer been able to pay the sum. The sherriffe once demanded it of the English, as the possessors of Surat; and, till they should satisfy him, forbade their captains to leave the port of Jidda. But the English disregarding this prohibition, the sherriffe complained to the Ottoman Porte, and they communicated his complaints to the English ambassador. He at the same time opened a negotiation with the nominal naboh, who resides in Surat. But these steps proved all fruitless: and the sovereign of Mecca seems not likely to be ever more benefited by the contribution from India.

The power of the sherriffe extends not to spiritual matters; these are entirely managed by the heads of the clergy, of different sects, who are resident at Mecca. Rigid Mussulmans, such as the Turks, are not very favourable in their sentiments of the sherriffes, but suspect their orthodoxy, and look upon them as secretly attached to the tolerant sect of the Zeidi.

SHETLAND, the name of certain islands belonging to Scotland, and lying to the northward of Orkney. There are many convincing proofs that these islands were very early inhabited by the Picts, or rather by those nations who were the original possessors of the Orkneys; and at the time of the total destruction of those nations, if any credit be due to tradition, their woods were entirely ruined (A). It is highly probable that the people in Shetland, as well as in the Orkneys, flourished under their own princes dependent upon the crown of Nurway; yet this seems to have been rather through what they acquired by fishing and commerce, than by the cultivation of their lands. It may also be reasonably presumed, that they grew thinner of inhabitants after they were annexed to the crown of Scotland; and it is likely that they revived again, chiefly by the very great and extensive improvements which the Dutch made in the herring fishery upon their coasts, and the trade that the crews of their busses, then very numerous, carried on with the inhabitants, necessarily resulting from their want of provisions and other conveniences, which in those days could not be very considerable.

There are many reasons which may be assigned why these islands, though part of our dominions, have not hitherto been better known to us. They were commonly placed two degrees too far to the north in all the old maps, in order to make them agree with Ptolemy's description of Thule, which he asserted to be in the latitude of 63 degrees; which we find urged by Camden as a reason why Thule must be one of the Shetland isles, to which Speed also agrees, though from their being thus wrong placed he could not find room for them in his maps. Another, and that no light cause, was the many false, fabulous, and impertinent relations published concerning them (B), as if they were countries inhospitable and uninhabitable; and lastly, the indolence, or rather indifference, of the natives, who, contenting themselves with those necessaries and conveniences procured by their intercourse with other nations, and conceiving

(A) The tradition is, that this was done by the Scots when they destroyed the Picts; but is more probably referred to the Norwegians rooting out the original possessors of Shetland.

(B) They represented the climate as intensely cold; the soil as composed of crags and quagmire, so barren as to be incapable of bearing corn; to supply which, the people, after drying fish bones, powdered them, then kneaded and baked them for bread. The larger fish bones were said to be all the fuel they had. Yet, in so dreary a country, and in such miserable circumstances, they were acknowledged to be very long lived, cheerful, and contented.

Shetland.

ceiving themselves neglected by the mother country, have seldom troubled her with their applications.

There are few countries that have gone by more names than these islands; they were called in Icelandic, *Hialtlandia*, from *bialt*, the "hilt of a sword;" this might be possibly corrupted into *Hetland*, *Hitland*, or *Hethland*, though some tell us this signifies a "high land." They have been likewise, and are still in some maps, called *Zetland* and *Zeatland*, in reference, as has been supposed, to their situation. By the Danes, and by the natives, they are styled *Tealtaland;* and notwithstanding the oddness of the orthography, this differs very little, if at all, from their manner of pronouncing Zeatland, out of which pronunciation grew the modern names of *Shetland* and *Shotland*.

The islands of *Shetland*, as we commonly call them, are well situated for trade. The nearest continent to them is Norway; the port of Bergen lying 44 leagues east, whereas they lie 46 leagues north north-east from Buchanness; east north-east from Sanda, one of the Orkneys, about 16 or 18 leagues; six or seven leagues north-east from Fair isle; 58 leagues east from the Ferro isles; and at nearly the same distance north-east from Lewis. The southern promontory of the Main-land, called *Sumburgh Head*, lies in 59 degrees and 59 minutes of north latitude; and the northern extremity of Unst, the most remote of them all, in the latitude of 61 degrees 15 minutes. The meridian of London passes through this last island, which lies about 2 degrees 30 minutes west from Paris, and about 5 degrees 15 minutes east from the meridian of Cape Lizard. According to Gifford's "Historical Description of Zetland," the inhabited islands are 33, of which the principal is styled *Main Land*, and extends in length from north to south about 60 miles, and is in some places 20 broad, though in others not more than two.

It is impossible to speak with precision; but, according to the best computatioo which we have been able to form, the Shetland isles contain near three times as much land as the Orkneys: they are considered also as equal in size to the island of Madeira; and not ioferior to the provinces of Utrecht, Zealand, and all the rest of the Dutch islands taken together; but of climate and soil they have not much to boast. The longest day in the island of Unst is 19 hours 15 minutes, and of consequence the shortest day 4 hours and 45 minutes. The spring is very late, the summer very short; the autumn also is of no long duration, dark, foggy, and rainy; the winter sets in about November, and lasts till April, and sometimes till May. They have frequently in that season storms of thunder, much rain, but little frost or snow. High winds are indeed very frequent and very troublesome, yet they seldom produce any terrible effects. The aurora borealis is as common here as in any of the northern countries. In the winter season the sea swells and rages in such a manner, that for five or six months their ports are inaccessible, and of course the people during that space have no correspondence with the rest of the world.

The soil in the interior part of the Main-land, for the most part, is mountainous, moorish, and boggy, yet oot to such a degree as to render the country utterly impassable; for many of the roads here, and in some of the northern isles, are as good as any other natural roads, and the people travel them frequently on all occasions. Near the coast there are sometimes for miles together flat pleasant spots, very fertile both in pasture and corn. The mountains produce large crops of very nutritive grass in the summer; and they cut considerable quantities of hay, with which they feed their cattle in the winter. They might with a little attention bring more of their country into cultivation: but the people are so much addicted to their fishery, and feel so little necessity of having recourse to this method for subsistence, that they are content, how strange soever that may seem to us, to let four parts in five of their land remain in a state of nature.

They want not considerable quantities of marl in different islands, though they use but little; hitherto there has been no chalk found; limestone and freestone there are in the southern parts of the Main-land in great quantities, and also in the neighbouring islands, particularly Fetlar; and considerable quantities of slate, very good in its kind. No mines have been hitherto wrought, though there are in many places visible appearances of several kinds of metal. Some solid pieces of silver, it is said, have been turned up by the plough. In some of the smaller isles there are strong appearances of iron; but, through the want of proper experiments being made, there is, in this respect at least, hitherto nothing certain. Their meadows are enclosed with dikes, and produce very good grass. The little corn they grow is chiefly barley, with some oats; though even in the northern extremity of Unst the little land which they have is remarkable for its fertility. The hills abound with medicinal herbs: and their kitchen gardens thrive as well, and produce as good greens and roots, as any in Britain. Of late years, and since this has been attended to, some gentlemen have had even greater success than they expected in the cultivating of tulips, roses, and many other flowers. They have no trees, and hardly any shrubs except juniper, yet they have a tradition that their country was formerly overgrown with woods; and it seems to be a confirmation of this, that the routs of timber trees have been, and are still, dug up at a great depth; and that in some, and those too inaccessible, places, the mountain ash is still found growing wild. That this defect, viz. the want of wood at present, does not arise entirely from the soil or climate, appears from several late experiments; some gentlemen having raised ash, maple, horse chesnuts, &c. in their gardens. Though the inhabitants are without either wood or coals, they are very well supplied with fuel, having great plenty of heath and peat. The black cattle in this country are in general of a larger sort than in Orkney, which is owing to their having more extensive pastures; a clear proof that still farther improvements might be made in respect to size. Their horses are small, but strong, stout, and well shaped, live very hardy, and to a great age. They have likewise a breed of small swine, the flesh of which, when fat, is esteemed very delicious. They have no goats, hares, or foxes; and in general no wild or venomous creatures of any kind except rats in some few islands. They have no moor-fowl, which is the more remarkable, as there are everywhere immense quantities of heath; but there are many sorts of wild and water fowl, particularly the dunter-goose, clack-goose, solan-goose, swans, ducks,

Shetland. docks, teal, whaps, soists, lyres, kittiwaiks, maws, plovers, cormorants, &c. There is likewise the ember goose, which is said to hatch her egg under her wing. Eagles and hawks, as also ravens, crows, mews, &c. abound here.

All these islands are well watered; for there are every where excellent springs, some of them mineral and medicinal. They have indeed no rivers; but many pleasant rills or rivulets, which they call *burns*, of different sizes; in some of the largest they have admirable trouts, some of which are 15 and even of 20 pounds weight. They have likewise many fresh water lakes, well stored with trout and eels, and in most of them there are also large and fine flounders; in some very excellent cod. These fresh water lakes, if the country was better peopled, and the common people more at their ease, are certainly capable of great improvements. The sea coasts of the main land of Shetland, in a straight line, are 55 leagues; and therefore there cannot be a country conceived more proper for establishing an extensive fishery. What the inhabitants have been hitherto able to do, their natural advantages considered, does not deserve that name, notwithstanding they export large quantities of cod, tusk, ling, and skate, insomuch that the bounty allowed by acts of parliament amounts from 1400l. to 2000l. annually. They have, besides, haddocks, whitings, turbot, and a variety of other fish. In many of the inlets there are prodigious quantities of excellent oysters, lobsters, muscles, cockles, and other shell fish. As to amphibious creatures, they have multitudes of otters and seals; add to these, that amber, ambergris, and other spoils of the ocean are frequently found upon the coasts.

The inhabitants are a stout, well-made, comely people; the lower sort of a swarthy complexion. The gentry are allowed, by all who have conversed with them, to be most of them polite, shrewd, sensible, lively, active, and intelligent persons; and these, to the number of 100 families, have very handsome, strong, well-built houses, neatly furnished; their tables well served, polished in their manners, and exceedingly hospitable and civil to strangers. Those of an inferior rank are hardy, robust, and laborious people, who, generally speaking, get their bread by fishing in all weathers in their yawls, which are little bigger than Gravesend wherries; live hardily, and in the summer season mostly on fish; their drink, which, in reference to the British dominions, is peculiar to the country, is called *bland*, and is a sort of butter-milk, long kept, and very sour. Many live to great ages, though not so long as in former times. In respect, however, to the bulk of the inhabitants, from the poorness of living, from the nature of it, and from the drinking great quantities of corn spirits of the very worst sort, multitudes are afflicted with an inveterate scurvy; from which those in better circumstances are entirely free, and enjoy as good health as in any other country in Europe. As they have no great turn to agriculture, and are persuaded that their country is not fit for it, they do not (though probably they might) raise corn enough to support them for more than two-thirds of the year. But they are much more successful in their pasture-grounds, which are kept well enclosed, in good order, and, together with their commons supply them plentifully with beef and mutton. They pay their rents generally in butter at Lammas, and in money at Martinmas. As to manufactures, they make a strong coarse cloth for their own use, as also linen. They make likewise of their own wool very fine stockings. They export, besides the different kinds of fish already mentioned, some herrings, a considerable quantity of butter and train oil, otter and seal skins, and no inconsiderable quantity of the fine stockings just mentioned. Their chief trade is to Leith, London, Hamburgh, Spain, and to the Straits. They import timbers, deals, and some of their best oats, from Norway; corn and flour from the Orkneys, and from North Britain; spirits and some other things from Hamburgh; cloths and better sort of linen from Leith; grocery, household furniture, and other necessaries from London. The superior duties to the earl of Morton are generally let in farm; and are paid by the people in butter, oil, and money. The remains of the old Norwegian constitution are still visible in the division of their lands; and they have some udulmen or freeholders amongst them. But the Scots laws, customs, manners, dress, and language, prevail; and they have a sheriff, and other magistrates for the administration of justice, as well as a customhouse, with a proper number of officers. In reference to their ecclesiastical concerns, they have a presbytery, 12 ministers, and an itinerant for Foula, Fair island, and the Skerries. Each of these ministers has a stipend of between 40 and 50 pounds, besides a house and a glebe free from taxes. The number of souls in these islands may be about 20,000.

Shew-bread, Shield.

SHEW-BREAD, the loaves of bread which the priest of the week put every Sabbath day upon the golden table in the sanctuary, before the Lord, in the temple of the Jews. They were 12 in number, and were offered to God in the name of the 12 tribes of Israel. They were shaped like a brick, were ten palms long, and five broad, weighing about eight pounds each. They were unleavened, and made of fine flour by the Levites. The priests set them on the table in two rows, six in a row, and put frankincense upon them to preserve them from moulding. They were changed every Sabbath, and the old ones belonged to the priest upon duty. Of this bread none but the priests might eat, except in cases of necessity. It was called the *bread of faces*, because the table of the shew bread being almost over against the ark of the covenant, the loaves might be said to be set before the face of God. The original table was carried away to Babylon, but a new one was made for the second temple. It was of wood overlaid with gold. This, with the candlestick and some other spoils, was carried by Titus to Rome.

SHIELD, an ancient weapon of defence, in form of a light buckler, borne on the arm to fend off lances, darts, &c. The form of the shield is represented by the escutcheon in coats of arms. The shield was that part of the ancient armour on which the persons of distinction in the field of battle always had their arms painted; and most of the words used at this time to express the space that holds the arms of families are derived from the Latin name for a shield, *scutum*. The French *escu* and *escusson*, and the English word *escutcheon*, or, as we commonly speak it, *scutcheon*, are evidently from this origin: and the Italian *scudo* signifies both the shield of arms and that used in war. The Latin name *clypeus*, for the same thing, seems also to be derived from the

the Greek word γλυφειν, *to engrave;* and it had this name from the several figures engraved on it, as marks of distinction of the person who wore it.

The shield in war, among the Greeks and Romans, was not unly useful in the defence of the body, but it was also a token, or badge of honour, to the wearer; and he who returned from battle without it was always treated with infamy afterwards. People have at all times thought this honourable piece of the armour the properest place to engrave, or figure on the signs of dignity of the possessor of it; and hence, when arms came to be painted for families in aftertimes, the heralds always chose to represent them upon the figure of a shield, but with several exterior additions and ornaments; as the helmet, supporters, and the rest.

The form of the shield has not only been found different in various nations, but even the people of the same nation, at different times, have varied its form extremely; and among several people there have been shields of several forms and sizes in use, at the same period of time, and suited to different occasions. The most ancient and universal form of shields, in the earlier ages, seems to have been the triangular. This we see instances of in all the monuments and gems of antiquity: our own most early monuments show it to have been the most antique shape also with us, and the heralds have found it the most convenient for their purposes, when they had any odd number of figures to represent; as if three, then two in the broad bottom part, and one in the narrow upper end, it held them very well; or if five, they stood as conveniently, as three below, and two above. The other form of a shield, now universally used, is square, rounded, and pointed at the bottom: this is taken from the figure of the Samnitic shield used by the Romans, and since copied very generally by the English, French, and Germans.

The Spaniards and Portuguese have the like general form of shields, but they are round at the bottom without the point; and the Germans, beside the Samnite shield, have two others pretty much in use: These are, 1. The bulging shield, distinguished by its swelling or bulging out at the flanks; and, 2. The indented shield, or shield chancree, which has a number of notches and indentings all round its sides. The use of the ancient shield of this form was, that the notches served to rest the lance upon, that it might be firm while it gave the thrust; but this form being less proper for the receiving armorial figures, the two former have been much more used in the heraldry of that nation.

Beside this different form of the shields in heraldry, we find them also often distinguished by their different positions, some of them standing erect, and others slanting various ways, and in different degrees; this the heralds express by the word *pendant*, "hanging," they seeming to be hung up not by the centre, but by the right or left corner. The French call these *ecu pendant*, and the common antique triangular ones *ecu ancien*. The Italians call this *scuto pendente;* and the reason given for exhibiting the shield in these figures in heraldry is, that in the ancient tilts and tournaments, they who were to just at these military exercises, were obliged to hang up their shields with their armories, or coats of arms on them, out at the windows and balconies of the houses near the place; or upon trees, pavilions, or the barriers of the ground, if the exercise was to be performed in the field.

Those who were to fight on foot, according to Columbier, had their shields hung up by the right corner, and those who were to fight on horseback had theirs hung up by the left. This position of the shields in heraldry is called *couché* by some writers, though by the generality *pendant*.

It was very frequent in all parts of Europe, in arms given between the 11th and 14th centuries; but it is to be observed, that the hanging by the left corner, as it was the token of the owner's being to fight on horseback, so it was esteemed the most honourable and noble situation; and all the pendant shields of the sons of the royal family of Scotland and England, and of our nobility at that time, are thus hanging from the left corner. The hanging from this corner was a token of the owner's being of noble birth, and having fought in the tournaments before; but no sovereign ever had a shield pendant any way, but always erect, as they never formally entered the lists of the tournament.

The Italians generally have their shields of arms of an oval form; this seems to be done in imitation of those of the popes and other dignified clergy: but their herald Petro Sancto seems to regret the use of this figure of the shield, as an innovation brought in by the painters and engravers as most convenient for holding the figures, but derogatory to the honour of the possessor, as not representing either antiquity or honours won in war, but rather the honours of some citizen or person of learning. Some have carried it so far as to say, that those who either have no ancient title to nobility, or have sullied it by any unworthy action, cannot any longer wear their arms in shields properly figured, but were obliged to have them painted in an oval or round shield.

In Flanders, where this author lived, the round and oval shields are in the disrepute he speaks of; but in Italy, besides the popes and dignified prelates, many of the first families of the laity have them.

The secular princes, in many other countries, also retain this form of the shield, as the most ancient and truly expressive of the Roman clypeus.

Shield, in heraldry, the escutcheon or field on which the bearings of coats of arms are placed. See Heraldry.

SHIELDRAKE, in ornithology. See Anas.

SHIELDS, North and South, two sea-port towns, the one north of the Tyne in Northumberland, the other on the south of the Tyne in the county of Durham. South Shields contains above 200 salt pans, and on both banks of the river are many convenient houses for the entertainment of seamen and colliers, most of the Newcastle coal fleet having their station here usually till their coals are brought down in the barges and lighters from Newcastle. A very large Roman altar, of one entire stone, was found some years ago near this place, and put into the hands of the learned Dr Lister, who, in his account of it sent to the Royal Society, says it was erected to Marcus Aurelius Antoninus Caracalla, when he took upon him the command of the empire and the whole army (after his father's death at York), for his safe return from his successful expedition against the Scots and Picts. W. Long. 1. 12. N. Lat. 55. 44.

SHIFTERS,

ifters || illing.

SHIFTERS, on board a man of war, certain men who are employed by the cooks to shift and change the water in which the flesh or fish is put, and laid for some time, in order to fit it for the kettle.

SHIFTING A TACKLE, in sea language, the act of removing the blocks of a tackle to a greater distance from each other, on the object to which they are applied, in order to give a greater scope or extent to their purchase. This operation is otherwise called *fleeting*. Shifting the helm denotes the alteration of its position, by pushing it towards the opposite side of the ship. Shifting the voyal, signifies changing its position on the capstern, from the right to the left, and *vice versa*.

SHILLING, an English silver coin, equal to twelve pence, or the twentieth part of a pound.

Freherus derives the Saxon *scilling*, whence our shilling, from a corruption of *siliqua;* proving the derivation by several texts of law, and, among others, by the 26th law, *De annuis legatis*. Skinner deduces it from the Saxon *scild*, "shield," by reason of the escutcheon of arms thereon.

Bishop Hooper derives it from the Arabic *schecle*, signifying *a weight;* but others, with greater probability, deduce it from the Latin *sicilicus*, which signified in that language *a quarter of an ounce*, or the 48th part of a Roman pound. In confirmation of this etymology it is alleged, that the shilling kept its original signification, and bore the same proportion to the Saxon pound as sicilicus did to the Roman and the Greek, being exactly the 48th part of the Saxon pound; a discovery which we owe to M. Lambarde *.

* Explicatio rerum et verborum in Leg. Sax. v. Libra.

However, the Saxon laws reckon the pound in the round number at 50 shillings, but they really coined out of it only 48; the value of the shilling was fivepence; but it was reduced to fourpence above a century before the Conquest; for several of the Saxon laws, made in Athelstan's reign, oblige us to take this estimate. Thus it continued to the Norman times, as one of the Conqueror's laws sufficiently ascertains; and it seems to have been the common coin by which the English payments were adjusted. After the Conquest, the French *solidus* of twelvepence, which was in use among the Normans, was called by the English name of shilling; and the Saxon shilling of fourpence took a Norman name, and was called the *groat*, or great coin, because it was the largest English coin then known in England.

It has been the opinion of the bishops Fleetwood and Gibson, and of the antiquaries in general, that, though the method of reckoning by pounds, marks, and shillings, as well as by pence and farthings, had been in constant use even from the Saxon times, long before the Norman conquest, there never was such a coin in England as either a pound or a mark, nor any shilling till the year 1504 or 1505, when a few silver shillings or twelve-pences were coined, which have long since been solely confined to the cabinets of collectors.

Mr Clarke combats this opinion, alleging that some coins mentioned by Mr Folkes, under Edward I. were probably Saxon shillings new minted, and that Archbishop Aelfric expressly says †, that the Saxons had three names for their money, viz. mancuses, shillings, and pennies. He also urges the different value of the Saxon shilling at different times, and its uniform proportion to the pound, as an argument that their shilling was a coin; and the testimony of the Saxon gospels, in which the words we have translated *pieces of silver* is rendered *shillings*, which, he says, they would hardly have done, if there had been no such coin as a shilling then in use. Accordingly the Saxons expressed their shilling in Latin by *siclus* and *argenteus*. He farther adds, that the Saxon shilling was never expressed by *solidus* till after the Norman settlement in England; and howsoever it altered during the long period that elapsed from the Conquest to the time of Henry VII. it was the most constant denomination of money in all payments, though it was then only a species of account, or the twentieth part of the pound sterling: and when it was again revived as a coin, it lessened gradually as the pound sterling lessened, from the 28th of Edward III. to the 43d of Elizabeth.

† Gram. Saxon, p. 52.

Shilling, Shiloh.

In the year 1560, there was a peculiar sort of shilling struck in Ireland, of the value of ninepence English, which passed in Ireland for twelvepence. The motto on the reverse was, *posui Deum adjutorem meum*. Eighty-two of these shillings, according to Malynes, went to the pound; they therefore weighed 20 grains, one-fourth each, which is somewhat heavier in proportion than the English shilling of that time, 62 whereof went to the pound, each weighing 92 grains seven-eighths; and the Irish shilling being valued at the Tower at ninepence English, that is, one-fourth part less than the English shilling, it should therefore proportionably weigh one-fourth part less, and its full weight be somewhat more than 62 grains; but some of them found at this time, though much worn, weighed 69 grains. In the year 1598, five different pieces of money of this kind were struck in England for the service of the kingdom of Ireland. These were shillings to be current in Ireland at twelvepence each; half shillings to be current at sixpence, and quarter shillings at threepence. Pennies and halfpennies were also struck of the same kind, and sent over for the payment of the army in Ireland. The money thus coined was of a very base mixture of copper and silver; and two years after there were more pieces of the same kinds struck for the same service, which were still worse; the former being three ounces of silver to nine ounces of copper; and these latter only two ounces eighteen pennyweights to nine ounces two pennyweights of the alloy.

The Dutch, Flemish, and Germans, have likewise their shilling, called *schelin, schilling, scalin*, &c. but these not being of the same weight or fineness with the English shilling, are not current at the same value. The English shilling is worth about 23 French sols; those of Holland and Germany about 11 sols and a half; those of Flanders about nine. The Dutch shillings are also called *sols de gros*, because equal to twelve gros. The Danes have copper shillings worth about one-fourth of a farthing sterling.

SHILOH is a term famous among interpreters and commentators upon Scripture. It is found (Gen. xlix. 10.) to denote the Messiah. The patriarch Jacob foretels his coming in these words: "The sceptre shall not depart from Judah, nor a lawgiver from between his feet, until Shiloh come; and unto him shall the gathering of the people be." The Hebrew text reads, עד כי יבא שלה, *until Shiloh come*. All Christian commentators agree, that this word ought to be understood of the Messiah, or Jesus Christ; but all are not agreed about

abnut its literal and grammatical ſignification. St Jerome, who tranſlates it by *Qui mittendus eſt*, manifeſtly reads *Shiloach* "ſent," inſtead of *Shiloh*. The Septuagint have it Εως αν ελθη τα αποκειμενα αυτω; or, Εως αν ελθη ὡ αποκειται, (as if they had read שלו instead of שלח), i. e. "Until the coming of him to whom it is reſerved:" or, "Till we ſee arrive that which is reſerved fur him."

It muſt be owned, that the ſignification of the Hebrew word *Shiloh* is not well known. Some tranſlate, "the ſceptre ſhall not depart from Judah, till he comes to whom it belongs;" שלח or שלי inſtead of לי אלו Others, "till the birth of him who ſhall be born of a pacific;" or, "of proſperity," שלח *proſperatus eſt*. *Shalah* ſignifies, "to be in peace, to be in proſperity;" others, "till the birtb of him who ſhall be born of a woman that ſhall conceive without the knowledge of a man," שיל or שליא *ſecundina, fluxus* †; otherwiſe, "the ſceptre ſhall nnt depart from Judah, till ita end, its ruin, till the downfal of the kingdom of the Jews," שאל or שלח *it has ceaſed, it has finiſhed* ‡. Some Rabbins have taken the name *Siloh* or *Shiloh*, as if it ſignified the city of this name in Paleſtine: "The ſceptre ſhall not be taken away frnm Judah till it comes to Shiloh; till it ſhall he taken from him to be given to Saul at Shiluh." But in what part of Scripture is it ſaid, tbat Saul was acknowledged as king or conſecrated at Shiloh? If we would underſtand it of Jeroboam the ſon of Nebat, the matter is ſtill as uncertain. The Scripture mentinns no aſſembly at Shiloh that admitted him as king. A more modern author derives *Siloh* from שלה, *fatigare*, which ſometimes ſignifies *to be weary, to ſuffer*; "till his labours his ſufferings, his paſſion, ſhall happen."

But not to amuſe ourſelves about ſeeking out the grammatical ſignificatinn of Shiloh, it is ſufficient for us to ſhow, that the ancient Jews are in this matter agreed with the Chriſtians: they acknowledge, that this word ſtands for the *Meſſiah the King*. It is thus that the paraphraſts Onkelos and Junathan, tbat the ancient Hebrew commentaries upon Geneſis, and that the Talmudiſts themſelves, explain it. If Jeſus Chriſt and his apoſtles did not make uſe of this paſſage to prove the coming of the Meſſiah, it was becauſe tben the completion of this prophecy was not ſufficiently manifeſt. The ſceptre ſtill continued amnng the Jews; they had ſtill kings of their own nation in the perſons of the Herods; but ſoon after the ſceptre was entirely taken away from tbem, and has never been reſtored to them ſince.

The cunceited Jews ſeek in vain to put forced meanings upon this prophecy of Jacob; ſaying, fur example, that the ſceptre intimates the dominion of ſtrangers, to which they have been in ſubjection, or the hope of ſeeing one day the ſceptre or ſupreme power ſettled again among themſelves. It is eaſy to perceive, that all this is contrived tu deliver themſelves out of perplexity. In vain likewiſe they take refuge in certain princes of the captivity, whom they pretend to have ſubſiſted beyond the Euphrates, exerciſing an authority over their nation little differing from abſolute, and being of the race of David. This pretended ſucceſſion of princes is perfectly chimerical; and though at certain times they could ſhow a ſucceſſion, it continued but a ſhort time, and their authority was too obſcure, and too much limited, to be the object of a prophecy ſo remarkable as this was.

SHINGLES, in building, ſmall pieces uf wood, or quartered oaken boards, ſawn to a certain ſcantling, or, as is more uſual, cleft to abnut an incb thick at one end, and made like wedges, four or five incbes broad, and eight or nine inches long.

Shingles are uſed inſtead of tiles or ſlates, eſpecially fur churches and ſteeples; however, this covering is dear; yet, where tiles are very ſcarce, aod a light covering is required, it is preferable to thatch; and where they are made of good oak, cleft, and not ſawed, and well ſeaſoned in water and the ſun, they make a ſure, light, and durable cuvering.

The building is firſt to be covered all over with boards, and the ſhinglea nailed upon them.

Ship.

SHIP, a general name for all large veſſels, particularly thoſe equipped with three maſts and a bowſprit; the maſts being compuſed of a lower-maſt, top-maſt, and top-gallant-maſt: each of theſe being provided with yards, ſails, &c. Ships, in general, are either employed for war or merchandiſe.

Ships of War are veſſels properly equipped with artillery, ammunition, and all the neceſſary martial weapons and inſtruments for attack or defence. They are diſtinguiſhed from each other by their ſeveral ranks or claſſes, called *rates*, as follows: Ships of the firſt rate mount from 100 guns to 110 guns and upwards; ſecond rate, frnm 90 to 98 guns; third rate, from 64 to 74 guns; fourth rate, from 50 to 60 guns; fifth rate, from 32 to 44 guns; and ſixth rates, from 20 to 28 guns. See the article RATE. Veſſels carrying leſs than 20 guns are denominated *ſloops, cutters, fire-ſhips*, and *bombs*. It has lately been propoſed to reduce the number of theſe rates, which would be a ſaving to the nation, and alſo productive of ſeveral material advantages.

In Plate CCCCL. is the repreſentation of a firſt rate, with rigging, &c. the ſeveral parts uf which are as follow:

Parts of the bull.—A, The cathead; B, The fore-chain-wales, ur chains; C, The main-chains; D, The mizen-chains; E, The entering port; F, The hawſeholes; G, The poop-lanterns; H, The cheſs-tree; I, The head; K, The ſtern.

1, The bowſprit. 2, Yard and ſail. 3, Gammoning. 4, Manrop. 5, Bobſtay. 6, Spritſail-ſheets. 7, Pendants. 8, Braces and pendants. 9, Halliards. 10, Lifts. 11, Clue-lines. 12, Spritſail-horſes. 13, Buntlines. 14, Standing liſts. 15, Bowſprit-ſhruud. 16, Jib boom. 17, Jibſtay and ſail. 18, Halliards. 19, Sheets. 20, Horſes. 21, Jib-guy. 22, Spritſail-topſail yard. 23, Hnrſes. 24, Sheets. 25, Lifts. 26, Braces and pendants. 27, Cap of bowſprit. 28, Jack ſtaff. 29, Truck. 30, Jack flag.—31, *Fore-maſt*. 32, Runner and tackle. 33, Shrowds. 34, Laniards. 35, Stay and laniard. 36, Preventer-ſtay and laniard. 37, Woolding of the maſt. 38, Fore-yard and ſail. 39, Horſes. 40, Top. 41, Crowfoot. 42, Jeers. 43, Yard-tackles. 44, Lifts. 45, Braces and pendants. 46, Sheets. 47, Foretacks. 48, Bowlines and bridles. 49, Fore bunt-lines. 50, Fore leech-lines. 51, Preventer-brace. 52, Futtock-ſhrouds.—53, *Foretop-maſt*. 54, Shrouds and laniards. 55, Foretop-ſail yard and ſail. 56, Stay and ſail. 57, Runner. 58, Back-ſtays. 59, Halliards. 60, Lifts. 61, Braces and pendants. 62, Horſes. 63, Clew-lines. 64, Bowlines and bridles. 65, Reef-tackles. 66, Sheets. 67, Buntlines.

Ship. Buntlines. 68, Cross-trees. 69, Cap. 70, Foretop-gallant-mast. 71, Shrouds. 72, Yard and sail. 73, Backstays. 74, Stay. 75, Lifts. 76, Clew-lines. 77, Braces and pendants. 78, Bowlines and bridles. 79, Flag-staff. 80, Truck. 81, Flag-staff-stay. 82, Flag of the lord high admiral.—83, *Main-mast.* 84, Shrouds. 85, Laniards. 86, Runner and tackle. 87, Futtock-shrouds. 88, Top-lantern. 89, Crank of ditto. 90, Stay. 91, Preventer stay. 92, Stay-tackles. 93, Woolding of the mast. 94, Jeers. 95, Yard-tackles. 96, Lifts. 97, Braces and pendants. 98, Horses. 99, Sheets. 100, Tacks. 101, Bowlines and bridles. 102, Crow-foot. 103, Cap. 104, Top. 105, Buntlines. 106, Leech-lines. 107, Yard and sail.—108, *Main-topmast.* 109, Shrouds and laniards. 110, Yard and sail. 111, Futtock shrouds. 112, Backstays. 113, Stay. 114, Staysail and halliards. 115, Tye. 116, Halliards. 117, Lifts. 118, Clew-lines. 119, Braces and pendants. 120, Horses. 121, Sheets. 122, Bowlines and Bridles. 123, Buntlines. 124, Reef-tackles. 125, Cross trees. 126, Cap.—127, *Main-top-gallant-mast,* 128, Shrouds and laniards. 129, Yard and sail. 130, Backstays. 131, Stay. 132, Stay-sail and halliard, 133, Lifts. 134, Braces and pendants. 135, Bowlines and bridles. 136, Clew-lines. 137, Flagstaff. 138, Truck. 139, Flagstaff-stay. 140, Flag standard.—141, *Mizen-Mast.* 142, Shrouds and laniards. 143, Cap. 144, Yard and sail. 145, Block for signal halliards. 146, Sheet. 147, Pendant lines. 148, Peck-brails. 149, Staysail. 150, Stay. 151, Derrick and span. 152, Top. 153, Cross-jack yard. 154, Cross-jack lifts. 155, Cross-jack braces. 156, Cross-jack slings.—157, *Mizen-top-mast.* 158, Shrouds and laniards. 159, Yard and sail. 160, Backstays. 161, Stay. 162, Halliards. 163, Lifts. 164, Braces and pendants. 165, Bowlines and bridles. 166, Sheets. 167, Clew-lines. 168, Staysail. 169, Cross-trees. 170, Cap. 171, Flag-staff. 172, Flagstaff-stay. 173, Truck. 174, Flag, union. 175, Ensign-staff. 176, Truck. 177, Ensign. 178, Stern ladder. 179, Bower cable.

Fig. 2. Plate CCCCLI. is a vertical longitudinal section of a first rate ship of war, with references to the principal parts; which are as follow:

A, Is the head, containing,—1, The stem; 2, The knee of the head or cutwater; 3, The lower and upper cheek; 4, The trail-board; 5, The figure; 6, The gratings; 7, The brackets; 8, The false stem; 9, The breast hooks; 10, The hause holes; 11. The bulkhead forward; 12, The cat-head: 13, The cat-hook; 14, Necessary seats; 15, The manger within board; 16, The bowsprit.

B, Upon the forecastle—17, The gratings; 18, The partners of the mast; 19, The gunwale; 20, The belfry; 21, The funnel for smoke; 22, The gangway going off the forecastle; 23, The forecastle guns.

C, In the forecastle—24, The door of the bulkhead forward; 25, Officers cabins; 26, Staircase; 27, Foretop-sail sheet bits; 28, The beams; 29, The carlings.

D, The middle gun-deck forward—30, The fore-jeer bits; 31, The oven and furnace of copper; 32, The captain's cook-room; 33, the ladder or way to the forecastle.

E, The lower gun-deck forward—34, The knees fore and aft; 35, The spirketings, or the first streak next to each deck, the next under the beams being called *clamps*; 36, The beams of the middle gun-deck fore and aft; 37, The carlings of the middle gun-deck fore and aft; 38, The fore bits; 39, The after or main bits; 40, The hatchway to the gunner's and boatswain's, store-rooms; 41, The jeer capstan.

F, The orlop—42, 43, 44, The gunner's, boatswain's, and carpenter's store-rooms; 45, The beams of the lower gun-deck; 46, 47, The pillars and the riders, fore and aft; 48, The bulkhead of the store-rooms.

G, The hold—49, 50, 51, The foot-hook rider, the floor rider, and the standard, fore and aft; 52, The pillars; 53, The step of the foremast; 54, The kelson, or false keel, and dead rising; 55, The dead-wood.

H, At midships in the hold—56, The floor-timbers; 57, The keel; 58, The well; 59, The chain pump; 60, The step of the mainmast; 61, 62, Beams and carlings of the orlop, fore and aft.

I, The orlop amidships—63, The cable tire; 64, The main hatchway.

K, The lower gun-deck amidships—65, The ladder leading up to the middle gun-deck; 66, The lower tire of ports.

L, The middle gun-deck amidship—67, The middle tire of ports; 68, The entering port; 69, The main jeer bits; 70, Twisted pillars or stanchions; 71, the capstan; 72, Gratings; 73, The ladder leading to the upper deck.

M, The upper gun-deck amidships—74, The maintop-sail-sheet bits; 75, The upper partners of the mainmast; 76, The gallows on which spare topmasts &c. are laid; 77. The foresheet blocks; 78. The rennets; 79, The gunwale; 80, The upper gratings; 81, The drift brackets; 82, The piss dale; 83, The capstan pall.

N, Abaft the mainmast—84, The gangway off the quarterdeck; 85, The bulkhead of the coach; 86, The staircase down to the middle gun-deck; 87, The beams of the upper deck; 88, The gratings about the mainmast; 89, The coach or council-chamber; 90, The staircase up to the quarterdeck.

O, The quarterdeck—91, The beams; 92, The carlings; 93, The partners of the mizenmast; 94, The gangway up to the poop; 95, The bulkhead of the euddy.

P, The poop—96, The trumpeter's cabin; 97, The tafforel.

Q, The captain's cabin.

R, The cuddy, usually divided for the master and secretary's officers.

S, the state-room, out of which is made the bed-chamber and other conveniences for the commander in chief; 98, The entrance into the gallery; 99, The bulkhead of the great cabin; 100, The stern lights and after galleries.

T, The ward-room, allotted for the lieutenants and marine officers; 101, The lower gallery; 102, The steerage and bulkhead of the ward-room; 103, The whip-staff, commanding the tiller; 104, The after staircase leading down to the lower gun-deck.

V, Several officers cabins abaft the mainmast, where the soldiers generally keep guard.

W, The gun-room—105, The tiller commanding the rudder; 106, The rudder; 107, The stern-post; 108, The tiller transom; 109, The several transoms, viz. 1, 2, 3, 4, 5; 110, The gun-room ports, or stern-chase; 111, The

111, The bread-room fcuttle, out of the gun-room; 112, The main capftan; 113, The pall of the capftan; 114, The partner; 115, The bulkhead of the bread-room.

X, The bread-room.

Y, The fteward's room, where all provifions are weighed and ferved out.

Z, The cockpit, where are fubdivifions for the purfer, the furgeon, and his mates.

AA, The platform or orlop, where provifion is made for the wounded in the time of fervice; 116, The hold abaft the main-maft; 117, The ftep of the mizen-maft; 118, The kelfon, or falfe keel; 119, The dead wood, or rifing.

Ships of war are fitted out either at the expence of the ftate or by individuals. Thofe fitted out at the public expence are called *King's fhips*, and are divided into *fhips of the line*, *frigates*, *floops*, &c. For an account of each of thefe, fee the refpective articles. Ships of war fitted out by individuals are called *privateers*. See the article PRIVATEER.

Armed-SHIP. See *ARMED-Ship*.

Bomb-SHIP. See *BOMB-Veffels*.

Double-SHIP. See *SHIP-Building*.

Fire-SHIP. See *FIRE-Ship*.

Hofpital-SHIP, a veffel fitted up to attend on a fleet of men of war, and receive their fick or wounded; for which purpofe her decks fhould be high, and her ports fufficiently large. Her cables ought alfo to run upon the upper deck, to the end that the beds or cradles may be more commodioufly placed between decks, and admit a free paffage of the air to difperfe that which is offenfive or corrupted.

Merchant-SHIP, a veffel employed in commerce to carry commodities of various forts from one port to another.

The largeft merchant fhips are thofe employed by the different companies of merchants who trade to the Eaft Indies. They are in general larger than our 40 gun fhips; and are commonly mounted with 20 guns on their upper deck, which are nine pounders; and fix on their quarter deck, which are fix pounders.

Regifter SHIP. See *REGISTER Ship*.

Store-SHIP, a veffel employed to carry artillery or naval ftores for the ufe of a fleet, fortrefs, or garrifon.

Tranfport-SHIP, is generally ufed to conduct troops from one place to another.

Befides the different kinds of fhips above-mentioned, which are denominated from the purpofe for which they are employed, veffels have alfo, in general, been named according to the different manner of rigging them. It would be an endlefs, and at the fame time an unneceffary tafk, to enumerate all the different kinds of veffels with refpect to their rigging; and therefore a few only are here taken notice of. Fig. 3. Plate CCCCLI. is a *fhip* which would be converted into a *bark* by ftripping the mizen-maft of its yards and the fails belonging to them. If each maft, its correfponding topmaft and topgallant maft, inftead of being compofed of feparate pieces of wood, were all of one-continued piece, then this veffel with very little alteration would be a *polacre*. Fig. 4. reprefents a *fnow*; fig. 5. a *bilander*; fig. 6. a *brig*; fig. 7. a *ketch*; fig. 8. a *fchooner*; fig. 9. a *floop*; fig. 10. a *xebec*; fig. 11. a *galliot*; fig. 12. a *dogger*; fig. 13. a *galley* under fail; fig. 14. ditto.

Plate CCCCLII.

Ships are alfo fometimes named according to the different modes of their conftruction. Thus we fay, a *cat*-built fhip, &c.

To SHIP, is either ufed actively, as to embark any perfon or put any thing aboard fhip: or paffively, to receive any thing into a fhip; as, "we fhipped a heavy fea at three o'clock in the morning."

To SHIP, alfo implies to fix any thing in its place; as, to fhip the oars, that is, to put them in their row-locks; to fhip the fwivel guns, is to fix them in their fockets; to fhip the handfpokes, &c.

Machine for drawing Bolts out of SHIPS, an inftrument invented by Mr William Hill for this purpofe. His account of which is as follows *.

"First, The ufe of this machine is to draw the kelfon and dead wood bolts out, and to draw the knee of the head bolts. Secondly, The heads of the kelfon bolts heretofore were all obliged to be driven through the kelfon floor timbers, and keel, to get them out: by this means the kelfon is often entirely deftroyed, and the large hole the head makes materially wounds the floors; and frequently, when the bolt is much corroded, it fcarfs, and the bolt comes out of the fide of the keel.—Thirdly, The dead-wood bolts that are driven with two or three drifts, are feldom or never got out, by which means the dead-wood is condemned, when fome of it is really ferviceable.—Fourthly, In drawing the knee of the head-bolts, fometimes the knee ftarts off, and cannot be got to again, but furs up, and with this machine may be drawn in; for it has been proved to have more power in ftarting a bolt than the maul."

* Tranfactions of the Society for the Encouragement of Arts, &c. Vol. X.

Plate CCCCLIII.

In fig. 1. "A, A, reprefent two ftrong male fcrews, working in female fcrews near the extremities of the cheeks againft plates of iron E, E. CC is the bolt to be drawn; which, being held between the chaps of the machine at D D, is, by turning the fcrews by the lever B, forced upwards out of the wood or plank of the fhip. F, F, are two dogs, with hooks at their lower extremities; which, being driven into the plank, ferve to fupport the machine till the chaps have got faft hold of the bolt. At the upper part of thefe dogs are rings paffing through holes in a collar, moveable near the heads of the fcrews. Fig. 2. is a view of the upper fide of the cheeks when joined together; *a*, *a*, the holes in which the fcrews work; *b*, the chaps by which the bolts are drawn. Fig. 3. The under fide of the cheek: *a*, *a*, the holes in which the fcrews work; *b*, the chaps by which the bolts are drawn, and where the teeth that gripe the bolt are more diftinctly fhown. Fig. 4. One of the cheeks feparated from the other, the letters referring as in fig. 2. and 3.

This machine was tried in his majefty's yard at Deptford, and was found of the greateft utility.—"Firft, It drew a bolt that was driven down fo tight as only to go one inch in fixteen blows with a double headed maul, and was well clenched below: the bolt drew the ring a confiderable way into the wood, and wire-drew itfelf through, and left the ring behind. Secondly, It drew a bolt out of the Venus's dead-wood that could not be got out by the maul. That part of it which went through the keel was bent clofe up to the lower part of the dead-wood, and the machine drew the bolt ftraight, and drew it out with eafe. It alfo drew a kelfon bolt out of the Stanley Weft Indiaman, in Meffrs Wells's yard, Deptford; which being a bolt of two drifts, could not be driven out.

Management of Ships at ſingle anchor, is the method of taking care of a ſhip while riding at ſingle anchor in a tide-way, by preventing her from fouling her anchor, &c. The following rules for this purpoſe, with which we have been favoured by Mr Henry Taylor * of North Shields, will be found of the utmoſt conſequence.

Taylor's Directions to young ſeamen riding at anchor in moderate weather.

Riding, in a tide-way, with a freſh-of-wind, the ſhip ſhould have what is called *a ſhort* or *windward ſervice*, ſay 45 or 50 fathoms of cable, and always ſheered to windward (A), not always with the helm hard down, but more or leſs ſo according to the ſtrength or weakneſs of the tide. It is a known fact, that many ſhips ſheer their anchors home, drive on board of other ſhips, and on the ſands near which they rode, before it has been diſcovered that the anchor had been moved from the place where it was let go.

1 When the ſhip will back.

When the wind is croſs, or nearly croſs, off-ſhore, or in the oppoſite direction, ſhips will always back. This is done by the mizen-topſail, aſſiſted, if needful, by the mizen-ſtayſail; ſuch as have no mizen-topſail commonly uſe the main-topſail, or if it blows freſh, a top-gallantſail, or any ſuch ſail at the gaff.

In backing, a ſhip ſhould always wind with a taught cable, that it may be certain the anchor is drawn round. In caſe there is not a ſufficiency of wind for that purpoſe, the ſhip ſhould be hove apeak.

2 How the yards ought to be braced.

Riding with the wind afore the beam, the yards ſhould be braced forward; if abaft the beam, they are to be braced all aback.

3 Riding windward ... in danger of breaking her ſheer.

If the wind is ſo far aft that the ſhip will not back (which ſhould not be attempted if, when the tide eaſes, the ſhip forges ahead, and brings the buoy on the lee quarter), ſhe muſt be ſeat ahead; if the wind is far aft, and blows freſh, the utmoſt care and attention is neceſſary, as ſhips riding in this ſituation often break their ſheer, and come to windward of their anchors again. It ſhould be obſerved, that when the ſhip lies in this ticklish ſituation, the after-yards muſt be braced forward, and the fore-yards the contrary way: ſhe will lie ſafe, as the buoy can be kept on the lee quarter, or ſuppoſe the helm is aport, as long as the buoy is on the larboard quarter. With the helm thus, and the wind right aſt, or nearly ſo, the ſtarboard main and fore braces ſhould be hauled in. This ſuppoſes the main braces to lead forward.

4 Tending to leeward ... the ſhip muſt be ſet ahead.

When the ſhip begins to tend to leeward, and the buoy comes on the weather-quarter, the firſt thing to be done is to brace about the fore-yard; and when the wind comes near the beam, ſet the fore-ſtayſail, and keep it ſtanding until it ſhakes; then brace all the yards ſharp forward, eſpecially if it is likely to blow ſtrong.

5 How to manage when the ſhip breaks her ſheer.

If lying in the aforeſaid poſition, and ſhe breaks her ſheer, brace about the main-yard immediately; if ſhe recovers and brings the buoy on the lee or larboard quarter, let the main-yard be again braced about; but if ſhe come to a ſheer the other way, by bringing the buoy on the other quarter, change the helm and brace the fore-yard to.

6 When a long ſervice is out, and the ſhip is likely to go to windward.

Riding leeward tide with more cable than the windward ſervice, and expecting the ſhip will go to windward of her anchor, begin as ſoon as the tide eaſes to ſhorten in the cable. This is often hard work; but it is neceſſary to be done, otherwiſe the anchor may be fouled by the great length of cable the ſhip has to draw round; but even if that could be done, the cable would be damaged againſt the bows or cut-water. It is to be obſerved, that when a ſhip rides windward-tide the cable ſhould be cackled from the ſhort ſervice towards the anchor, as far as will prevent the bare part touching the ſhip.

When the ſhip tends to windward and muſt be ſet ahead, hoiſt the fore-ſtayſail as ſoon as it will ſtand, and when the buoy comes on the lee-quarter, haul down the fore-ſtayſail, brace to the fore-yard, and put the helm a-lee; for till then the helm muſt be kept a-weather and the yards full.

7 How to manage in a ſtorm.

When the ſhip rides leeward tide, and the wind increaſes, care ſhould be taken to give her more cable in time, otherwiſe the anchor may ſtart, and probably it will be troubleſome to get her brought up again; and this care is the more neceſſary when the ſhip rides in the hauſe of another ſhip. Previous to giving a long ſervice it is uſual to take a weather-bit, that is, a turn of the cable over the windlaſs end, ſo that in veering away the ſhip will be under command. The ſervice ought to be greaſed, which will prevent its chafing in the hauſe.

If the gale continues to increaſe, the topmaſts ſhould be ſtruck in time; but the fore-yard, ſhould ſeldom, if ever, be lowered down, that in caſe of parting the foreſail may be ready to ſet. At ſuch times there ſhould be more on deck than the common anchor-watch, that no accident may happen from inattention or falling a ſleep.

In a tide-way a ſecond anchor ſhould never be let go but when abſolutely neceſſary; for a ſhip will ſometimes ride eaſier and ſafer, eſpecially if the ſea runs high, with a very long ſcope of cable and one anchor, than with leſs

(A) It has been thought by ſome theoriſts, that ſhips ſhould be ſheered to leeward of their anchors; but experience and the common practice of the beſt informed ſeamen are againſt that opinion: for it is found, that when a ſhip rides leeward tide and ſheered to windward, with the wind two or three points upon the bow, and blowing hard, in the interval between the ſqualls the ſheer will draw her towards the wind's eye; ſo that when the next ſquall comes, before ſhe be preſſed aſtream of her anchor, it is probable there will be a lull again, and the ſpring which the cable got by the ſheer will greatly eaſe it during the ſquall.

Every ſeaman knows that no ſhip without a rudder, or the helm left looſe, will wear; they always in ſuch ſituations fly to: this proves that the wind preſſing upon the quarter and the helm a-lee, a ſhip will be leſs liable to break her ſheer than when the helm is a-weather. Beſides, if the helm is a-lee when ſhe breaks her ſheer, it will be a-weather when the wind comes on the other quarter, as it ought to be until ſhe either ſwing to leeward, or bring the buoy on the other quarter. Now if the ſhip breaks her ſheer with the helm a-weather, it throws her head to the wind ſo ſuddenly as ſcarce to give time to brace the yards about, and very probably ſhe will fall over her anchor before the fore-ſtayſail can be got up.

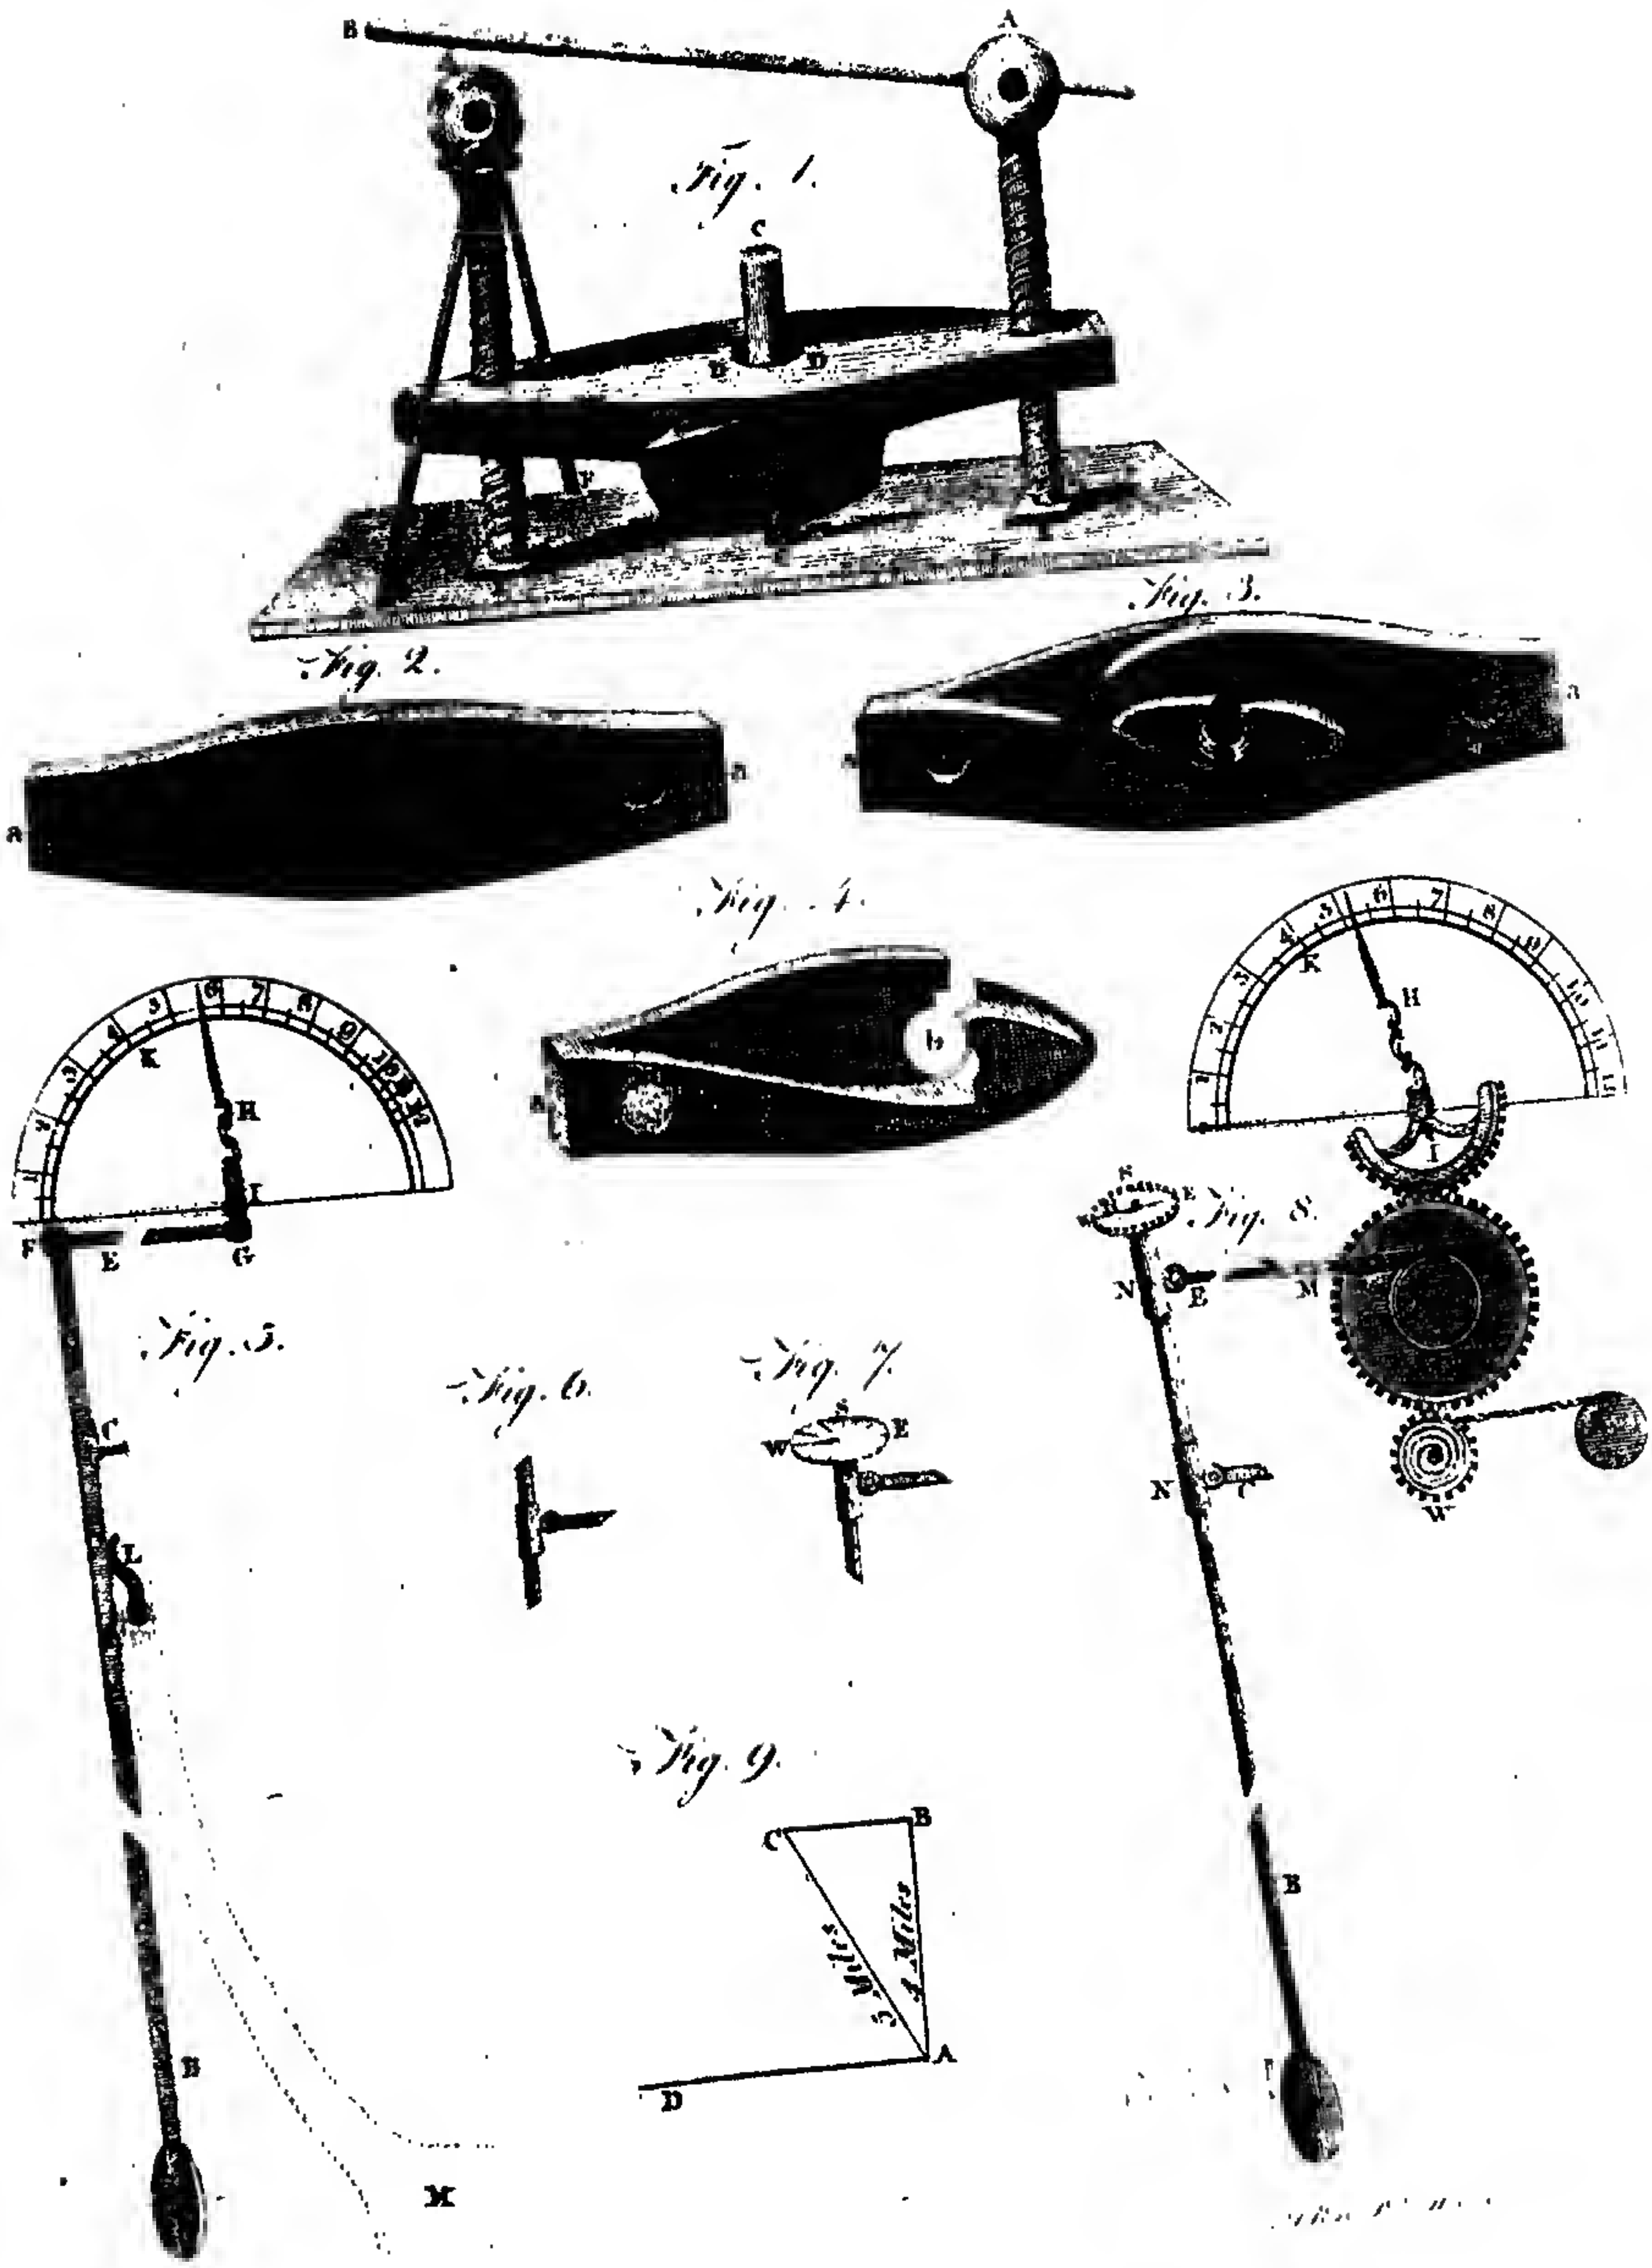
SHIP BOLTS.



Ship.

leſs length and two cables; however, it is adviſable, as a preventive, when ſhips have not room to drive, and the night is dark, to let fall a ſecond anchor under foot, with a range of cable along the deck. If this is not thought neceſſary to be done, the deep-ſea lead ſhould be thrown overboard, and the line frequently handled by the watch, that they may be aſſured ſhe rides faſt.

8
Caution reſpecting the anchor-watch.

If at any time the anchor-watch, preſuming on their own knowledge, ſhould wind the ſhip, or ſuffer her to break her ſheer without calling the mate, he ſhould immediately, or the very firſt opportunity, oblige the crew to heave the anchor in ſight; which will prevent the commiſſion of the like fault again; for beſides the ſhare of trouble the watch will have, the reſt of the crew will blame them for neglecting their duty.

9
The particular duty of the chief mate.

Prudent mates ſeldom lie a week in a road-ſtead without heaving their anchor in ſight; even though they have not the leaſt ſuſpicion of its being foul. There are other reaſons why the anchor ſhould be looked at; ſometimes the cable receives damage by ſweeping wrecks or anchors that have been loſt, or from rocks or ſtones; and it is often neceſſary to trip the anchor, in order to take a clearer birth, which ſhould be done as often as any ſhip brings up too near.

Method for the ſafe removal of ſuch Ships as have been driven on ſhore. For this purpoſe empty caſks are uſually employed to float off the veſſel, eſpecially if ſhe is ſmall, and at the ſame time near the port to which it is propoſed to conduct her. In other caſes, the following method adopted by Mr Bernard * will anſwer.

"On January 1. 1779 (ſays Mr Barnard), in a moſt dreadful ſtorm, the York Eaſt Indiaman, of eight hundred tons, homeward bound, with a pepper cargo, parted her cables in Margate roads, and was driven on ſhore, within one hundred feet of the head and thirty feet of the ſide of Margate pier, then drawing twenty-two feet ſix inches water, the flow of a good ſpring tide being only fourteen feet at that place.

"On the third of the ſame month I went down, as a ſhip-builder, to aſſiſt, as much as lay in my power, my worthy friend Sir Richard Hotham, to whom the ſhip belonged. I found her perfectly upright, and her ſheer (or ſide appearance) the ſame as when firſt built, but ſunk to the twelve feet water mark fore and aft in a bed of chalk mixed with a ſtiff blue clay, exactly the ſhape of her body below that draft of water; and from the rudder being torn from her as ſhe ſtruck coming on ſhore, and the violent agitation of the ſea after her being there, her ſtern was ſo greatly injured as to admit free acceſs thereto, which filled her for four days equal to the flow of the tide. Having fully informed myſelf of her ſituation and the flow of ſpring-tides, and being clearly of opinion ſhe might be again got off, I recommended, as the firſt neceſſary ſtep, the immediate diſcharge of the cargo; and, in the progreſs of that buſineſs, I found the tide always flowed to the ſame height on the ſhip; and when the cargo was half diſcharged, and I knew the remaining part ſhould not make her draw more than eighteen feet water, and while I was obſerving the water at twenty-two feet ſix inches by the ſhip's marks, ſhe inſtantly lifted to ſeventeen feet eight inches; the water and air being before excluded by her preſſure on the clay, and the atmoſphere acting upon her upper part equal to ſix hundred tons, which is the weight of water diſplaced at the difference of theſe two drafts of water.

"The moment the ſhip lifted, I diſcovered ſhe had received more damage than was at firſt apprehended, her leaks being ſuch as filled her from four to eighteen feet water in an hour and a half. As nothing effectual was to be expected from pumping, ſeveral ſcuttles or holes in the ſhip's ſide were made, and valves fixed thereto, to draw off the water at the loweſt ebb of the tide, to facilitate the diſcharge of the remaining part of the cargo; and, after many attempts, I ſucceeded in an external application of ſheep ſkins ſewed on a ſail and thruſt under the bottom, to ſtop the body of water from ruſhing ſo furiouſly into the ſhip. This buſineſs effected, moderate pumping enabled us to keep the ſhip to about ſix feet water at low water, and by a vigorous effort we could bring the ſhip ſo light as (when the cargo ſhould be all diſcharged) to be eaſily removed into deeper water. But as the external application might be diſturbed by ſo doing, or totally removed by the agitation of the ſhip, it was abſolutely neceſſary to provide ſome permanent ſecurity for the lives of thoſe who were to navigate her to the river Thames. I then recommended as the cheapeſt, quickeſt, and moſt effectual plan, to lay a deck in the hold, as low as the water could be pumped to, framed ſo ſolidly and ſecurely, and caulked ſo tight, as to ſwim the ſhip independent of her own leaky bottom.

"Beams of fir timber twelve inches ſquare were placed in the hold under every lower deck beam in the ſhip, as low as the water would permit; theſe were in two pieces, for the conveniency of getting them down, and alſo for the better fixing them of an exact length, and well bolted together when in their places. Over theſe were laid long Dantzic deals of two inches and a half thick, well nailed and caulked. Againſt the ſhip's ſide, all fore and aft, was well nailed a piece of fir twelve inches broad and ſix inches thick on the lower and three inches on the upper edge, to prevent the deck from riſing at the ſide. Over the deck, at every beam, was laid a croſs piece of fir timber ſix inches deep and twelve inches broad, reaching from the pillar of the hold to the ſhip's ſide, on which the ſhores were to be placed to reſiſt the preſſure of the water beneath. On each of theſe, and againſt the lower deck beam, at equal diſtances from the ſide and middle of the ſhip, was placed an upright ſhore, ſix inches by twelve, the lower end let two inches into the croſs piece. From the foot of this ſhore to the ſhip's ſide, under the end of every lower deck beam, was placed a diagonal ſhore ſix inches by twelve, to eaſe the ſhip's deck of part of the ſtrain by throwing it on the ſide. An upright ſhore of three inches by twelve was placed from the end of every croſs piece to the lower deck beams at the ſide, and one of three inches by twelve on the midſhip end of every croſs piece to the lower deck beam, and nailed to the pillars in the hold. Two firm tight bulkheads or partitions were made as near the extremes of the ſhip as poſſible. The ceiling or inſide plank of the ſhip was very ſecurely caulked up to the lower deck, and the whole formed a complete ſhip with a flat bottom within ſide, to ſwim the outſide leaky one; and that bottom being depreſſed ſix feet below the external water, reſiſted the ſhip's weight above it equal to five hundred and eighty-one tons, and ſafely conveyed her to the dry dock at Deptford."

* Phil. Tranſ. Vol. LXX. Part I.

SHIP-BUILDING.

SHIP-BUILDING.

tion. SHIP-BUILDING, or Naval Architecture, is the art of conſtructing a ſhip ſo as to anſwer a particular purpoſe either of war or merchandiſe.

ry. To whom the world is indebted for the inventinn of ſhips, is like all otber things of equal antiquity, uncertain.

A very ſmall portion of art or contrivance was ſeen in the firſt ſhips: they were neither ſtrong nor durable; but conſiſted only of a few planks laid together, without beauty or ornament, and juſt ſo compacted as to keep out the water. In ſome places they were only the hulks or ſtocks of trees hollowed, and then conſiſted only of one piece of timber. Nor was wood alone applied to this uſe; but any other buoyant materials, as the Egyptian reed papyrus; or leather, of which the primitive ſhips were frequently compoſed; tbe bottom and ſides being extended on a frame of thin battens or ſcantlings, of flexible wood, or begirt with wickers, ſuch as we have frequently beheld amongſt the American ſavages. In this manner they were often navigated upon the rivers of Ethiopia, Egypt, and Sabean Arabia, even in later times. But in the firſt of them, we find no mention of any thing but leather or hides ſewed together. In a veſſel of this kind, Dardanus ſecured his retreat to the country afterwards called *Troas*, when he was compelled by a terrible deluge to forſake his former habitation of Samothrace. According to Virgil, Charon's infernal boat was of the ſame compoſition.

But as the other arts extended their influence, naval architecture likewiſe began to emerge from the gloom of ignorance and barbariſm; and as the ſhips of thoſe ages were increaſed in bulk, and better proportioned for commerce, the appearance of thoſe floating citadels of unuſual form, full of living men, flying with ſeemingly expanded wings over the ſurface of the untravelled ocean, ſtruck the ignorant people with terror and aſtoniſhment: and hence, as we are told by Ariſtophanes, aroſe the fable of Perſeus flying to the Gorgons, who was actually carried thither in a ſhip! Hence, in all probability, the famous ſtory of Triptolemus riding on a winged dragon is deduced, only becauſe he failed from Athens, in the time of a great dearth, to a more plentiful country, to ſupply the neceſſities of his people. The fiction of the flying horſe Pegaſus may be joined with theſe, who, as ſeveral mythologiſts report, was nothing but a ſhip with ſails, and thence ſaid to be the offspring of Neptune the ſovereign of the ſea; nor does there appear any other foundation for the ſtories of griffins, or of ſhips transformed into birds and fiſhes, which we ſo often meet with in the ancient poets. So acceptable to the firſt ages of the world were inventions of this nature, that whoever made any improvements in navigation or naval architecture, building new ſhips better fitted for ſtrength or ſwiftneſs than thoſe uſed before, or rendered the old more commodious by additional contrivances, or diſcovered countries unknown to former travellers, were thought worthy of the greateſt honours, and often aſſociated into the number of their deified heroes. Hence we have in aſtronomy the ſigns of Aries and Taurus, which were no other than two ſhips: the former tranſported Phryxus from Greece to Colchos, and the latter Europa from Phœnicia to Crete. Argo, Pegaſus, and Perſeus, were likewiſe new ſhips of a different ſort from the former, which being greatly admired by the barbarous and uninſtructed people of thoſe times, were tranſlated amongſt the ſtars, in commemoration of their inventors, and metamorphoſed into conſtellations by the poets of their own and of ſucceeding ages. History.

The chief parts, of which ſhips anciently conſiſted, were three, viz. the belly, the prow, and the ſtern: theſe were again compoſed of other ſmaller parts, which ſhall be briefly deſcribed in their order. In the deſcription, we chiefly follow Scheffer, who hath ſo copiouſly treated this ſubject, and with ſuch induſtry and learning collected whatever is neceſſary to illuſtrate it, that very little room is left for enlargement by thoſe who incline to purſue this inveſtigation.

1. In the belly, or middle part of the ſhip, there was τροπις, *carina*, or the "keel," which was compoſed of wood: it was placed at the bottom of the ſhip, being deſigned to cut and glide through the waves, and therefore was not broad, but narrow and ſharp; whence it may be perceived that not all ſhips, but only the μακραι, which ſhips of war were called, whoſe bellies were ſtraight and of a ſmall circumference, were provided with keels, the reſt having uſually flat bottoms. Around the outſide of the keel were fixed pieces of wood, to prevent it from being damaged when the ſhip was firſt launched into the water, or afterwards ſtruck on any rocks; theſe were called χελυσματα, in Latin *cunei*.

Next to the keel was φαλκις, the "pump-well, or well-room," within which was contained the αντλιον, or "pump;" through which water was conveyed out of the ſhip.

After this, there was δευτερα τροπις, or the "ſecond keel," ſomewhat reſembling what is now called the *kelſon*; it was placed beneath the pump, and called λεσβιον, χαλκηϊ, κλιντοποδιον: by ſome it is falſely ſuppoſed to be the ſame with φαλκις.

Above the pump was a hollow place, called by Herodotus κοιλη της νηος, by Pollux κυτος and γαστρα, becauſe large and capacious, after the form of a belly; by the Latins, *teſtudo*. This was formed by crooked ribs, with which it was ſurrounded, which were pieces of wood riſing from the keel upwards, and called by Heſychius νομεις, and by others, εγκοιλια, the belly of the ſhip being contained within them: in Latin, *coſtæ*; and in Engliſh, *timbers*. Upon theſe were placed certain planks, which Ariſtophanes calls επηγκενιδας, or επηγκενιδα.

The πλευραι, *latera*, or "ſides" of the ſhip, encompaſſed all the former parts on both hands; theſe were compoſed of large rafters extended from prow to ſtern, and called ζωστηρες, and ζωσματα, becauſe by them the whole fabric was begirt or ſurrounded.

In both theſe ſides the rowers had their places, called τοιχοι and εδωλια, in Latin *fori* and *tranſtra*, placed above one another; the loweſt was called θαλαμος, and thoſe that laboured therein θαλαμιοι; the middle ζυγα, and the men ζυγιοι; the uppermoſt θρανοι, whence the rowers

rowers were termed θρανιται. In these apartments were spaces through which the rowers put their oars: these were sometimes one continued vacuity from one end to the other, called τραφηξ, but more usually distinct holes, each of which was designed for a single oar; these were styled τρημαλα, τρυπηματα, as also οφθαλμοι, because not unlike the eyes of living creatures. All of them were by a more general name termed εγκωπα, from containing the oars; but εγκωπιν seems to have been another thing, signifying the spaces between the banks of oars on each side, where the passengers appear to have been placed. On the top of all there was a passage or place to walk, called παραδος, and παρεδρεσιος, as joining to the θρανοι, or uppermost bank of oars.

2. Πρωρα, "the "prow or fore-deck," whence it is sometimes called μετωπον, and commonly distinguished by other metaphorical titles taken from human faces. In some ships there is mention of two prows, as also two sterns: such was Danaus's ship adorned by Minerva when he fled from Egypt. It was usual to beautify the prow with gold and various sorts of paint and colours; in the primitive times red was most in use; whence Homer's ships were commonly dignified with the titles of μιλτοπαρηοι, and φοινικοπαρηοι, or "red-faced;" the blue likewise, or sky-colour, was frequently made use of, as bearing a near resemblance to the colour of the sea; whence we find ships called by Homer κυανοπρωροι, by Aristophanes κυανεμβολοι. Several other colours were also made use of; nor were they barely varnished over with them, but very often annealed by wax melted in the fire, so as neither the sun, winds, nor water, were able to deface them. The art of doing this was called from the wax κηρογραφια, from the fire εγκαυστικη, which is described by Vitruvius, and mentioned in Ovid.

——— *Picta coloribus ustis*
Caeruleam matrem concava puppis habet—

The painted ship with melted wax anneal'd
Had Tethys for its deity———

In these colours the various forms of gods, animals, plants, &c. were usually drawn, which were likewise often added as ornaments to other parts of the ships, as plainly appears from the ancient monuments presented to the world by Baysius.

The sides of the prow were termed πτερα, or "wings," and παρεια, according to Scheffer, or rather παρειαι; for since the prow is commonly compared to a human face, it will naturally follow that the sides should be called *cheeks*. These are now called *bows* by our mariners.

3. Πρυμνη, "the hind-deck or poop," sometimes caleld ουρα, the "tail," because the hindmost part of the ship: it was of figure more inclining to round than the prow, the extremity of which was sharp, that it might cut the waters; it was also built higher than the prow, and was the place where the pilot sat to steer; the outer-bending part of it was called επιοτιον, answering to our term *quarter*.

They had various ornaments of sculpture on the prow; as helmets, animals, triumphal wreaths, &c.—The stern was more particularly adorned with wings, shields, &c. Sometimes a little mast was erected whereon to hang ribbands of divers colours, which served instead of a flag to distinguish the ship; and a weather-cock, to signify the part from whence the wind blew.

On the extremity of the prow was placed a round piece of wood, called the πλυχις, from its bending; and sometimes οφθαλμος, the "eye" of the ship, because fixed in the fore-deck; on this was inscribed the name of the ship, which was usually taken from the figure painted on the flag. Hence comes the frequent mention of ships called *Pegasi*, *Scyllae*, *bulls*, *rams*, *tigers*, &c. which the poets took the liberty to represent as living creatures that transported their riders from one country to another.

The whole fabric being completed, it was fortified with pitch, and sometimes a mixture of rosin, to secure the wood from the waters; whence it comes that Homer's ships are everywhere mentioned with the epithet of μελαιναι, or "black." The first that made use of pitch were the inhabitants of Phaeacia, since called Corsica; sometimes wax was employed in the same use; whence Ovid,

Caerulea ceratas accipit unda rates.

The azure waves receive the waxed ships.

After all, the ship being bedecked with garlands and flowers, the mariners also adorned with crowns, she was launched into the sea with loud acclamations and other expressions of joy; and being purified by a priest with a lighted torch, an egg and brimstone, or after some other manner, was consecrated to the god whose image she bore.

The ships of war of the ancients were distinguished from other kinds of vessels by various turrets and accessions of building, some to defend their own soldiers, and others to annoy the enemy; and from one another, in latter ages, by several degrees or ranks of oars, the most usual number of which was four or five, which appear not to have been arranged, as some imagine, on the same level in different parts of the ship; nor yet, as others have supposed, directly above one another's heads; but their seats being placed one behind another, ascended gradually, like stairs. Ptolemy Philopater, urged by a vain-glorious desire of exceeding all the world besides in naval architecture, is said to have farther enlarged the number of banks to 40; and the ship being otherwise in equal proportion, this raised her to such an enormous bulk, that she appeared at a distance like a floating mountain or island; and, upon a nearer view like a prodigious castle on the ocean. She was 280 cubits long, 38 broad, and 48 high (each cubit being 1 English foot $5\frac{1}{2}$ inches), and carried 400 rowers, 400 sailors, and 3000 soldiers. Another which the same prince made to sail on the Nile, we are told, was half a stadium long. Yet these were nothing in comparison of Hiero's ship, built under the direction of Archimedes; on the structure whereof Moschion wrote a whole volume. There was wood enough employed in it to make 50 galleys; it had all the variety of apartments of a palace; such as banqueting rooms, galleries, gardens, fish ponds, stables, mills, baths, and a temple to Venus. The floors of the middle apartment were all inlaid, and represented in various colours the stories of Homer's Iliad. The ceilings, windows, and all other parts, were finished with wonderful art, and embellished with all kinds of ornaments. In the uppermost apartment there was a spacious gymnasium, or place for exercise, and water was conveyed to the garden by pipes, some

History. some of hardened clay, and others of lead. The floors of the temple of Venus were inlaid with agates and other precious stones; the inside lined with cypress wood; the windows adorned with ivory, paintings, and small statues. There was likewise a library. This vessel was adorned on all sides with fine paintings. It had 20 benches of oars, and was encompassed with an iron rampart, eight towers, with walls and bulwarks, furnished with machines of war, particularly one which threw a stone of 300 pounds, or a dart 12 cubits long, the space of half a mile, with many other particulars related by Athenæus. Caligula likewise built a vessel adorned with jewels in the poop, with sails of many colours, and furnished with large porticoes, bagnios, and banqueting-rooms, besides rows of vines, and fruit-trees of various kinds. But these, and all such monstrous fabrics, served only for show and ostentation, being rendered by their vast bulk unwieldy and unfit for service. Athenæus informs us, the common names they were known by, were *Cyclades* or *Ætana*, i. e. "islands, or mountains," to which they seemed nearly equal in higness; consisting, as some report, of as many materials as would have composed 50 triremes, or ships of three banks.

The vessels employed by the northern nations appear to have been still more imperfect than those of the Romans; for a law was enacted in the reign of the emperor Honorius, 24th September, A. D. 418, inflicting capital punishment on any who should instruct the barbarians in the art of ship-building; a proof at once of the great estimation in which this science was then held, and of the ignorance of the barbarians with regard to it.

The fleet of Richard I. of England, when he weighed anchor for the holy war from Messina, in Sicily, where he had passed the winter, A. D. 1190-1, is said to have consisted of 150 great ships and 53 galleys, besides barks, tartans, &c. What kinds of ships these were is not mentioned. To the crusades, however pernicious in other respects, this science seems to owe some improvements; and to this particular one we are indebted for Richard's marine code, commonly called the *Laws of Oleron*, from the name of a small island on the coast of France, where he composed them, and which most of the nations in Europe have made the basis of their maritime regulations. Those ships, if they merit the name of ships, were probably very small, as we find that so long after as the time of Edward I. anno 1304, 40 men were deemed sufficient to man the best and largest vessels in England; and that Edward the Third, anno 1335, ordained the mayor and sheriffs of London to "take up all ships in their port, and all other ports in the kingdom, of the borden of 40 tons and upwards, and to furnish the same with armed men and other necessaries of war, against the Scots his enemies, confederated with certain persons of foreign nations. Edward the Third's fleet before Calais, anno 1347, consisting of 738 English ships, carrying 14,956 mariners, being on an average but 20 men to each ship; 15 ships and 459 mariners, from Bayonne in Guienne, being 30 men to each ship; 7 ships and 184 men from Spain, which is 26 men to each ship; one from Ireland, carrying 25 men; 14 from Flanders, with 133 men being scarcely 10 men to each ship; and one from Guelderland, with 24 mariners. Fifteen of these were called the king's own ships, manned with 419 mariners, being somewhat over 27 to each ship.

Fœdera, Vol. II. p. 943.

Ib. Vol. IV. p. 664.

Historians represent the vessels of Venice and Genoa as the largest and the best about this time, but they were soon exceeded in size by the Spanish vessels called *carricks*, some of which carried cannon; and these again were exceeded by the vessels built by the northern people, particularly those belonging to the Hanse towns.— In the 14th century, the Hanseatics were the sovereigns of the northern seas, as well without as within the Baltic; and their ships were so large, that foreign princes often hired them in their wars. According to Hakluyt, an English ship from Newcastle, of 200 tons burden, was seized in the Baltic by those of Wismar and Rostock, anno 1394: and another English vessel of the same borden was violently seized in the port of Lisbon, anno 1412.

Fœdera, Vol. VIII. p. 727.

Soon after ships of a much larger size were constructed. It is mentioned that a very large ship was built, anno 1449, by John Taverner of Hull; and in the year 1455, King Henry VI. at the request of Charles king of Sweden, granted a license for a Swedish ship of the burden of a thousand tons or under, laden with merchandise, and having 120 persons on board, to come to the ports of England, there to dispose of their lading, and to relade back with English merchandise, paying the usual customs. The inscription on the tomb of William Canning, an eminent merchant, who had been five times mayor of Bristol, in Ratcliff-church at Bristol, anno 1474, mentions his having forfeited the king's peace, for which he was condemned to pay 300 merks; in lieu of which sum, King Edward IV. took of him 2470 tons of shipping, amongst which there was one ship of 900 tons burden, another of 500 tons, and one of 400 tons, the rest being smaller.

Ib. Vol. XI p. 258.

Ib. Vol. XI p. 364.

In the year 1506, King James IV. of Scotland built the largest ship which had hitherto been seen, but which was lost in her way to France in the year 1512, owing probably to a defective construction, and the unskilfulness of the crew in managing so large a ship.— About this time a very large ship was likewise built in France. In the fleet fitted out by Henry VII. anno 1512, there was one ship, the Regent, of 1000 tons burden, one of 500, and three of 400 each. A ship still larger than the Regent was built soon after, called *Henri Grace de Dieu!* In the year 1522 the first voyage round the globe was finished.

The English naval historians think that ships carried cannon on their upper decks only, and had not gun-ports before the year 1545: and it is certain that many of the largest ships in former times were fitted out from harbours, where ships of a moderate size now would not have water enough to float them. In 1575 the whole of the royal navy did not exceed 24 ships, and the number of merchant ships belonging to England amounted to no more than 135 vessels above 100 tons, and 656 between 40 and 100 tons. At Queen Elizabeth's death, anno 1603, there were not above four merchant ships in England of 400 ton burden each.— The largest of Queen Elizabeth's ships of war was 1000 tons burden, carrying but 340 men, and 40 guns, and the

Monson's Naval Tracts, p. 294.

the smallest 600 tons, carrying 150 men and 30 guns. Smaller vessels were occasionally hired by her from private owners.

In the memorable sea-fight of Lepanto between the Turks and Christians, *anno* 1571, no vessels were employed but galleys; and it would appear from the carcases of some of them, which are still preserved in the arsenal at Venice, that even these were not so large or so well constructed as those of our times. The Invincible Armada, as Spanish vanity styled it, once the terror and admiration of nations, in the pompous and exaggerated descriptions of which the Spanish authors of those times dwelt with so much apperent pleasure, consisted of 130 ships, near 100 of which were the statelieft that had yet been seen on the ocean. The largest of these, however, would be no more than a third rate vessel in our navy, and they were so ill constructed, that they would neither move easily, sail near the wind, nor be properly worked in tempestuous weather. The whole of the naval force collected by Queen Elizabeth to oppose this formidable fleet, including hired vessels tenders, store-ships, &c. amounted to no more than 143.

Ship-building began now to make a considerable progress in Britain. Both war and trade required an increase of shipping; so that, in the year 1670, the annual charge of the navy was reported to be 500,000l.; and in 1678 the navy consisted of 83 ships, of which 58 were of the line. At this time the exports amounted to ten millions *per annum*; and the balance of trade was two millions. In 1689 there were 173 ships, great and small, in the royal navy, and it has been constantly increasing; so that in 1761 the ships in the navy amounted to 372, of which 129 were of the line; and in the beginning of the year 1795, the total amount was above 430.

3
[Shi]ps of [the] com[mo]n form [a]nd de[fec]tive,

As ships of the common construction are found to be very defective in many particulars, various methods have therefore from time to time been proposed to remove some of the bad qualities they possessed. As it would be an endless task to enumerate the different inventions for this purpose, therefore a few of them only will be mentioned.

4
[an]d im[pro]vements [p]roposed.

5
[Do]uble [ship]s in[tro]duced [by] Sir Wil[lia]m Petty, [Eu]ropean [Ma]gazine August [17]82

In 1663 Sir William Petty constructed a double ship, or rather a single ship with a double bottom, which was found to sail considerably faster than any of the ships with which it had an opportunity of being tried. Her first voyage was from Dublin to Holyhead; and in her return "she turned into that narrow harbour against wind and tide, among rocks and ships, with such dexterity as many ancient seamen confessed they had never seen the like." This vessel with 70 more were lost in a dreadful tempest.

6
[an]d again [pr]oposed [by] Mr [Go]rdon, [17]84.

This subject was again revived by Mr Gordon, in his Principles of Naval Architecture, printed at Aberdeen anno 1784; where, having delivered his sentiments on the construction of large masts, he says: "These experiments likewise point out to us methods by which two vessels may be laterally connected together, though at a considerable distance from each other, in a manner sufficiently strong, with very little increase of weight or expence of materials, and without exposing much surface to the action or influence of the wind or the waves, or obstructing their motion in any considerable degree, and consequently without being much opposed by them on that account under any circumstances; and if vessels are judiciously constructed with a view to such a junction, it would be no easy matter to enumerate all the advantages that may be obtained by this means." He then enumerates the advantages that double vessels would have over those of the common construction. Soon after double ships were actually built by Mr Miller of Dalswinton.

7
and lately constructed by Mr Miller.

Another plan was proposed by Mr Gordon to make a ship sail fast, draw little water, and to keep a good wind. For this purpose, "the bottom (he says) should be formed quite flat, and the sides made to rise perpendicular from it, without any curvature; which would not only render her more steady, as being more opposed to the water in rolling, but likewise more convenient for stowage, &c. while the simplicity of the form would contribute greatly to the ease and expedition with which she might be fabricated. Though diminishing the draught of water is, *cæteris paribus*, undoubtedly the most effectual method of augmenting the velocity with which vessels go before the wind; yet, as it proportionally diminishes their hold of the water, it renders them extremely liable to be driven to leeward, and altogether incapable of keeping a good wind. This defect may, however, be remedied, in a simple and effectual manner, by proportionally augmenting the depth of keel, or, as so large a keel would be inconvenient on many accounts, proportionally increasing their number; as, in place of adding a keel eight feet deep to a vessel drawing six feet water, to affix to different parts of her flat bottom, which would be well adapted for receiving them, six different keels of two feet deep each at equal distances from each other, with proper intervals between; which will be found equally effectual for preventing these pernicious effects. Four such, indeed, would have answered the purpose as well as the eight feet keel, were it not for the superior pressure or resistance of the lower water (A).

Principles of Naval Architecture, p. 76.

8
Draught of water proposed to be diminished in order to obtain velocity, &c.

9
Inconveniency of this plan

10
remedied by augmenting the depth of the keel,

11
or by increasing the number of keels.

Thus then it appears, that a vessel drawing eight feet water only, keels and all, may be made to keep as good a wind, or be as little liable to be driven to leeward, as the sharpest built vessel of the same length drawing 14, nay 20 or upwards, if a few more keels are added, at the same time that she would be little more resisted in moving in the line of the keels than a vessel drawing six feet water only. These keels, besides, would strengthen the vessel considerably, would render her more steady, and less liable to be overset, and thereby enable

(A) This is frequently repeated on the authority of Mr Gordon and others. Theory says otherwise; and the experiments of Sir Isaac Newton show in the most unexceptionable manner, that the resistance of a ball descending through the water is the same at all depths; nay, the heaping up of the water on the bow, occasioning a hydrostatical pressure in addition to the real resistance, will make the whole opposition to an equal surface, but of greater horizontal dimensions, greater, because it bears a greater proportion to the resistance.

History.

enable her to carry more sail; and Mr Gordon then enumerates the several advantages that a ship of this construction will possess.

12 The plan further improved by the adoption of sliding keels.

This plan has lately been put into execution by Captain Schank, with this difference only, that instead of the keels being fixed as proposed by Mr Gordon, Captain Schank constructed them so as to slide down to a certain depth below the bottom, or to be drawn up within the ship as occasion might require.

13 The utility of sliding keels proved by experiment.

Captain Schank having communicated his plans to the Navy Board, two vessels were in consequence ordered to be built of 13 tons each, and similar in dimensions, one on the old construction, and the other flat-bottomed, with sliding keels. In 1790 a comparative trial in presence of the commissioners of the navy was made on the river Thames, each having the same quantity of sail; and although the vessel on the old construction had leeboards, a greater quantity of ballast, and two Thames pilots aboard, yet Captain Schank's vessel with three sliding keels beat the other vessel, to the astonishment of all present, one half of the whole distance sailed; and no doubt she would have beat her much more had she been furnished with a Thames pilot.

14 And actually put in practice upon a larger scale.

This trial gave so much satisfaction, that a king's cutter of 120 tons was immediately ordered to be built on the same construction, and Captain Schank was requested to superintend its building. This vessel was launched at Plymouth in 1791, and named the *Trial*. The length of this vessel is 66 feet, breadth 21 feet, and depth of the hold seven feet: her bottom is quite flat, and draws only six feet water, with all her guns, stores, &c. whereas all other vessels of her tonnage on the old construction draw 14 feet; so that she can go with safety into almost any harbour or creek. She has three sliding keels enclosed in a case or well; they are each 14 feet in length; the fore and the after keels are three feet broad each, and the middle keel is six feet broad. The keels are moveable by means of a winch, and may be let down seven feet below the real keel; and they work equally well in a storm as in still water. Her hold is divided into several compartments, all water tight, and so contrived, that should even a plank or two start at sea in different parts of the vessel, she may be navigated with the greatest security to any place. If she should be driven on shore in a gale of wind, she will not soon become a wreck, as her keels will be driven up into their cases, and the ship being flat-bottomed, will not be easily overset; and being able to go into such shallow water, the crew may all be easily saved. By means of her sliding keels she is kept steady in the greatest gale; she is quite easy in a great sea, does not strain in the least, and never takes in water on her deck; and when at anchor, she rides more upright and even than any other ship can do: she sails very fast either before or upon a wind; no vessel she has ever been in company with, of equal size, has been able, upon many trials, to beat her in sailing; and yet her sails seem too small.

It has also been proposed to construct vessels of other materials than wood; and lately a vessel was built whose bottom, instead of being plank, was copper.

Properties of Ships.

Book I. *Containing the Method of delineating the several Sections of a Ship.*

Chap. I. *Of the Properties of Ships.*

A ship ought to be constructed so as to answer the particular purpose for which she is intended. It would be an easy matter to determine the form of a ship intended to sail by means of oars; but, when sails are used, a ship is then acted upon by two elements, the wind and water: and therefore it is much more difficult than is commonly imagined to ascertain the form of a ship so as to answer in an unfavourable as well as a favourable wind; the ship at the same time having a cargo of a certain weight and magnitude. 15 General principles of ship-building.

Every ship ought to sail well, but particularly when the wind is upon the beam; for this purpose a considerable length in proportion to the breadth is necessary, and the plane of resistance should be the least possible. The main frame should also be placed in a proper situation; but according to the experiments of Mr Chapman *, its plane is variable with the velocity of the ship: the mean place of the main frame has, however, been generally estimated to be about one-twelfth of the length of the keel before the middle. Without a sufficient degree of stability a ship will not be able to carry a press of sail: a great breadth in proportion to the length and low upper works will augment the stability. The following particulars being attended to, the above property will be gained, and the ship will also steer well. The wing transom should be carried pretty high; the fashion pieces well formed, and not full below the load water line: the lower part of the stem to be a portion of a circle, and to have a considerable rake; the sternpost to be nearly perpendicular to the keel; and all the upper works kept as low as possible. 16 Properties that a ship must possess to be a good sailer.

* *Traité de la construction des Vaisseaux*, p. 40.

Many ships from construction are liable to make much leeway. This may in a great measure be avoided by giving the ship a long keel, little breadth, and a considerable depth in the hold: whence the bow will meet with little resistance in comparison to the side, and therefore the ship will not fall much to the leeward. 17 To make a ship keep a good wind,

Another very great retardation to the velocity of a ship is her pitching. The principal remedy for this is to increase the length of the keel and floor, to diminish the rising afore and abaft, and to construct the hull in such a manner that the contents of the fore body may be duly proportioned to the contents of the after body. 18 and to sail smoothly without pitching hard.

In a ship of war the lower tier of guns ought to be of a sufficient height above the water, otherwise it will be impossible to work the lee-guns, when it blows hard. This property will be obtained by giving her a long floor timber, little rising, a full midship frame, light upper works, and the wing transom not too high: And in every ship the extreme breadth ought always to be higher afore and abaft than at midships. 19 In ships of war the lower deck guns to be sufficiently high above the water.

A merchant ship, besides being a fast sailer, ought to carry a considerable cargo in proportion to its length, to sail with little ballast, and to be navigated with few hands. 20 Properties of a merchant ship.

That a ship may take in a considerable cargo, it should 21 to take in a great cargo.

should have a great breadth and depth in proportion to its length, a full bottom, and a long and flat floor. But a ship of this construction will neither sail fast, nor carry much sail.

If a ship be filled out much towards the line of floatation, together with low upper works, she will require little ballast: and that ship which is stiff from construction is much better adapted for sailing fast than one which, in order to carry the same quantity of canvas, is obliged to be loaded with a much greater weight: for the resistance is as the quantity of water to be removed, or nearly as the area of a transverse section of the immersed part of the body at the midship frame; and a body that is broad and shallow is much stiffer than one of the same capacity that is narrow and deep. "The advantages (says Mr Gordon) are numerous, important, and obvious. For it is evident, that by enlarging, perhaps doubling, the breadth of vessels, and forming their bottoms flat and well furnished with keels, they must, in the *first* place, become much steadier, roll little, if any, and be enabled to carry greatly more sail, and that in a better direction, at the same time that they would be in no danger of being dismasted or overset, unless the masts were of a most extraordinary height indeed. *Secondly*, They would have little or no occasion for ballast, and if any was used, could incur less danger from its shifting. *Thirdly*, That there would be much more room upon deck, as well as accommodation below; the breadth being so much increased without any diminution of the height above the load-water line. *Fourthly*, That they would deviate much less from the intended course, and penetrate the water much easier in the proper direction: for doubling the breadth, without any increase of weight, would diminish the depth or draught of water one-half; and though the extent of the directly opposing surface would be the same as before, yet the vessel in moving would meet with half the former resistance only: for so great is the difference between the pressure, force, or reaction, of the upper and the under water. *Fifthly*, That they would by this means be adapted for lying unsupported in docks and harbours when dry, be rendered capable of being navigated in shallow water, and of being benefited by all the advantages attending that very important circumstance; and it is particularly to be observed, that making vessels which may be navigated in shallow water, may, in many respects, justly be regarded as a matter of equal importance with increasing the number of harbours, and improving them, as having identically the same effects with regard to navigation; at the same time, that the benefits which would result from such circumstances are obtained by this means without either expence, trouble, or inconveniency: besides, it would not only enable vessels to enter many rivers, bays, and creeks, formerly inaccessible to ships of burden, but to proceed to such places as are most land-locked, where they can lie or ride most secure, and with least expence of men and ground tackle. As ships of war would carry their guns well by being so steady, there could be but little occasion for a high topside, or much height of hull above water; and as little or no ballast would be required, there would be no necessity, as in other vessels, for increasing their weight on that account, and thereby pressing them deeper into the water. These are very important circumstances, and would contribute much to improve the sailing of such vessels." From whence it appears, that there would be united, what has hitherto been deemed irreconcileable, the greatest possible stability, which is nearly as the area of a transverse section of the immersed part of the body at the midship frame: and a body that is broad and shallow is much stiffer than one of the same capacity that is narrow and deep. A ship of this construction may take in a considerable cargo in proportion to her size; but if deeply loaded will not sail fast, for then the area of a section of the immersed part at the midship frame will be very considerable; and as the sails of such a ship must necessarily be large, more hands will therefore be required.

Properties of Ships.

24 And to be navigated with few hands.

The less the breadth of a ship, the fewer hands will be necessary to work her; as in that case the quantity of sail will be less, and the anchors also of less weight. We shall gain much (says M. Bouguer) by making the extreme breadth no more than the fifth or sixth part of the length, if, at the same time, we diminish the depth proportionally; and likewise this most surprising circumstance, that by diminishing these two dimensions, or by increasing the length, a ship may be made to go sometimes as fast as the wind.

Traité du Navire.

25 Impossible to unite all these qualities in the same ship.

In order to obtain the preceding properties, very opposite rules must be followed; and hence it appears to be impossible to construct a ship so as to be possessed of them all. The body, however, must be so formed, that as many of these properties may be retained as possible, always observing to give the preference to those which are most required. If it is known what particular trade the ship is to be employed in, those qualities are then principally to be adhered to which are most essentially necessary for that employment.

26 Small ships inferior to large ones in point of sailing, &c.

It may easily be demonstrated that small ships will not have the same advantages as large ones of a similar form, when employed in the same trade: for a large ship will not only sail faster than a small one of a similar form, but will also require fewer hands to work her. Hence, in order that a small ship may possess the same advantages as a large one, the corresponding dimensions will not be proportional to each other. The reader will see in Chapman's *Architectura Navalis Mercatoria* ample tables of the several dimensions of ships, of different classes and sizes, deduced from theory combined with experiment. Tables of the dimensions of the principal ships of the British navy, and of other ships, are contained in the Ship-builder's Repository, and in Murray's Treatise on Ship-building.

Chap. II. *Of the different Plans of a Ship.*
